The American Iron & Steel Association has published complete statistics of the production of all kinds of pig iron in the United States in 1901, based upon reports received from the manufacturers, also complete statistics of all stocks of pig iron on hand on December 31, 1901. The total production of pig iron last year is shown to have reached the enormous total of 15,878,354 gross tons, against 13,789,242 tons in 1900; 13,620,703 in 1899; 11,773,934 in 1898, and 9,652,680 tons in 1897. The increase in the first half of 1901 over the second half of 1900 was 1,527,940 tons, and the increase in production in the second half of 1901 over the first half of the year preceding was 529,128 tons, the total increase in 1901 over 1900 being 2,089,112 tons. This is a far larger increase than was shown even in the boom year 1899 over 1898. The total stocks of unsold pig iron on December 31, 1901, amounted to only 70,647 tons, against 442,370 tons at the close of 1900, and 372,560 tons on June 30, 1901.

Those who are familiar with the way in which New York City is laid out are impressed with the fact that the city block is the unit. With the exception of certain localities, in each block may be found the elements of a town. The avenue frontages serve to make the main streets where the business of the little town is done, and along the side streets and above the stores are the residences of the people. A study of an individual block in the city shows that practically every want of mankind may be satisfied in its limits. If communication with the world were suddenly shut off the inhabitants of each city block would not have to go beyond the confines of their little settlement to find the means of filling every want. Each block has its butcher shop, its bakery, its grocer, generally two or three saloons, a drug store, or perhaps two; two or three green grocers and fruit merchants, several small dealers in coal and ice, a barber shop, several doctors and an undertaker's shop. It is a strange thing that the depot for coffins is often between a butcher shop and a drug store.

Hollow blocks of cement instead of bricks are coming into general use for building purposes in Denmark, the blocks being made 13 x 13 or 9 x 13, according to the character of the wall. A mixture of sand and slow setting cement is rammed into dry molds in the usual way. After about six weeks' hardening the blocks are strong enough for most building purposes. It is claimed that houses built with these blocks are fit for occupation immediately after completion, and that the inside of the wall requires neither cleaning nor preparation, but is ready for papering or painting at once.

SOUTHERN STOVE MANUFACTURERS' ASSOCIATION ADVANCE PRICES.

A meeting of the Southern Stove Manufacturers' Association was held at Chattanooga, Tenn., on February 5, when the subject of advancing prices was discussed. This resulted in a confirmation of the advances made by the Eastern and Western associations. The advances will probably be 5 per cent. on cast iron goods and 10 per cent. on steel ranges and oak stoves. The matter was referred to a committee for final adjustment.

THE STOVE TRADE IN NEW YORK.

Reference was made in these columns a week or two ago to the call for a meeting of the manufacturers who are interested in the sale of stoves in New York. This meeting resulted in the appointment of a committee who have now sent to manufacturers the result of their deliberations as to a basis on which an association can be formed. The situation at the present time seems to be one of apathy on the part of many on the outside, who seem to be waiting to see what the New York local manufacturers will do, without lending them any assistance or offering substantial encouragement. It is clear to some of the men who are well informed as to the situation that the New York manufacturers can do nothing except defend themselves against the outsiders who demoralize local conditions. To look the matter fairly in the face, New York has lost the capacity which it once had to readily dispose of the surplus product of all parts of the country. It is an equally pertinent fact that if New York continues to be an open market with a competition of the survival of the fittest type, the demoralization will not long be confined to its immediate territory. The prices which rule in New York City will become known sooner or later to buyers in other sections of the United States, and those who have been factors in producing the conditions in New York are likely to find troubles nearer home.

The stove manufacturers of New England, Pennsylvania, Western New York and the West all have an interest equal to that of the New York manufacturers in an improvement in the conditions in the local market, and they should be as active and energetic in working for the improvement as those on the spot, instead of enjoying better conditions in their own sections and waiting to see what will be done at this one point where prices are considered to be too low; for these prices may soon prevail over a wider scope of country. It is not strange that under the conditions some local manufacturers have little interest in the attempt to reorganize the old association or form a new one, and that they feel that their long experience will enable them to take care of themselves in a bitter struggle against those who are less advantageously located. The first step to success will be the establishment of the confidence which is so essential. The confidence now felt by many is of a feeble type, and of the defensive and hesitating character. If the interests which induced Secretary Hogan of the National Association of Stove Manufacturers to visit New York are really in earnest in the desire to have a change in the method of marketing goods in this territory, they will have to give better assurances to the New York manufacturers than have been received before success will attend any effort in this direction. The New York manufacturers will have to be impressed that the effort is an honest one before it secures their full cooperation.

R. Ward Hillman, who is well known to the Stove and heating trade in the vicinity of New York, has opened an office at 210 Water street, where he will represent the interests of Floyd, Wells & Co. of Royersford, Pa. Mr. Hillman has now the Irving Ranges and the Rosemont and Bengal Hot Air Furnaces as leaders, worthy of the attention of any buyer. In addition to these goods a catalogue of about 200 pages contains an exhaustive line of Cooking and Heating Stoves, well calculated to meet the requirements of all in the trade.

THE FURNACE TRADE.

Reports from various sections of the country show that the manufacturers of stoves very generally have reached the conclusion that their business should bring a better return, and as a result there has been a quite general advance in the selling price of these goods. A prominent Eastern furnace manufacturer, in a recent letter, makes the statement: "There is no doubt that the trade in boilers and radiators has been kept in a very satisfactory condition by means of co-operation; but it is unfortunate that the stove men, and especially the furnace manufacturers, cannot bring their views to accomplish the same results." The sale of stoves, in many instances, has been restricted to territory not very far distant from the manufacturing plant. The furnace, however, is capable of being sold in a wider territory. The difficulty in getting furnace manufacturers to arrive at a common conclusion may be due to their wide separation. This, however, is not sufficient excuse for some of the existing conditions. There can be no doubt, however, that the action of the stove manufacturers has led to the abandoning of some of the objectionable practices which had crept into the furnace trade. Owing to the increasing competition found with steam and hot water goods, furnacemen must necessarily advocate a better class of work, and those who make and sell furnaces will have to bear the brunt of this enterprise. If this work is as necessary as it would seem to be, it must be shared by the whole trade. This cannot be expected unless all engaged in the manufacture of furnaces support the effort and do their part. Before an effort to this end can be made successfully there must be a thorough discussion of the whole outlook, and it will be necessary for some men to devote considerable time to explaining it to other men who are less apt in taking up new ideas. Whenever those who have in view the betterment of the condition of the furnace trade, as a whole, are ready to take up the matter our columns will be freely open to a discussion of the subject.

Death of James Spear.

James Spear, president of the James Spear Stove & Heating Company, of Philadelphia, died on Thursday, January 30, at the Aldine Hotel, Philadelphia, where he resided. His death was indirectly due to an attack of the grip, contracted two years ago, which weakened his system so that he was unable to withstand the effects of a heavy cold with which he was recently attacked. Mr. Spear was born at Mauch Chunk, Pa., on February 17, 1827, and was descended from Scotch-Irish stock. He went to Ohio with his parents as a child, and moved to Philadelphia when about 21 years of age, entering the employment of North, Chase & North, stove dealers of that city. Subsequently he succeeded to a large part of the business of that concern, which he carried on under his own name until 1890, when the present concern were incorporated. Mr. Spear was widely known as an inventor of heating and cooking appliances, and patented a number of valuable inventions. Among his many important pieces of property of this class, was the anti-clinker grate, now in general use. Included in his later inventions was Spear's new cooking range, Spear's Twentieth Century cabin car stove and Spear's Twentieth Century car heater. Mr. Spear for many years was an elder in the Presbyterian Church, at the time of his death being connected in that capacity with the Wallingford Presbyterian Church. He also was a member of the Union League Club and served on many important committees of the Philadelphia Board of Trade. He was also actively interested in a number of charitable and philanthropic movements and institutions, and was a generous benefactor to the University of Pennsylvania. He leaves a widow, two daughters and one son. The funeral, which was private, was held on Saturday.

The Walker & Pratt Mfg. Company of Boston, Mass., last week notified the workmen of their factory, at Watertown, Mass., that beginning Monday, February 3, the plant would run on a 56-hour per week basis, without a reduction of wages, instead of the 59-hour week on which the company's foundry has been run for years past. This concession by the concern is greatly appreciated by their employees, who already enjoy many advantages not found with other similar concerns. For years the wages paid by the company have been as high if not higher than any other concern in their line. Their consideration for the comfort and well being of their employees is well known. The past year was a record breaker in the company's business and by far the largest in their history. It has been found necessary to make a second addition of 40 x 150 feet to the molding shop to accommodate the expansion of their business.

WHAT SHOULD A FURNACEMAN KNOW?

BY C. A. H.

In reading over the article in *The Metal Worker* of January 25, entitled "What Should a Furnaceman Know?" I notice the omission of one most important point, and that is the dust question. What I mean by the dust question is the dust carried into the rooms of a house with the hot air from a furnace. How can this be successfully overcome? If it should be overcome, the hot air furnace would have a much easier time in competition with steam and hot water. This is one of the things that furnacemen should know how to overcome, and I am satisfied that if those who have had some experience with this trouble would describe the methods that they have tried and the success that has attended them, many in the furnace trade would be interested.

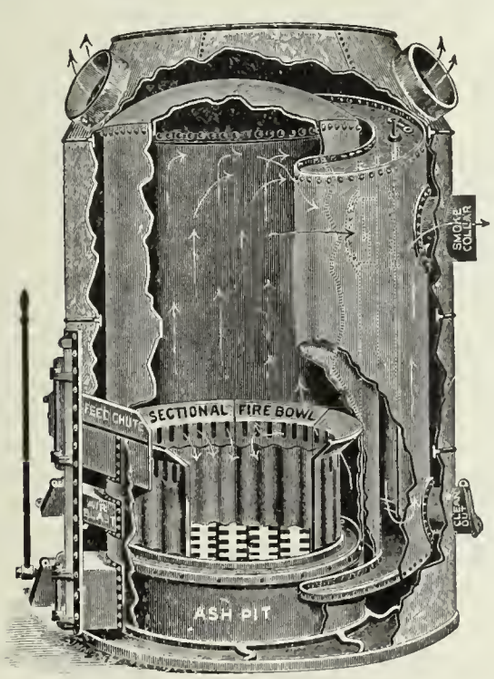
Another thing that the furnaceman should know is how to advance the interest of that method of heating at all times. Selfish enjoyment of some method or device limits the benefit that is sure in the end to advantageously affect the whole furnace trade. Wherever a man does good work the popularity of the furnace system of heating is increased, to the advantage of all who are engaged in this class of work and all who manufacture hot air furnaces. If a furnaceman will take a broader view of the matter and co-operate for the improvement of furnace work and the building up of the popularity of the furnace system of heating, everybody will derive benefit from the effort.

Nothing Better Than Hot Air!

An enthusiastic supporter of the indirect system of heating sends us the following abstract from the *Yale Record*, the university organ, in which a lampooner of the faculty on general subjects has evidently touched up our correspondent:

There is another thing that seems rather overpriced, and that is heat. Ten dollars each to a pair of roommates for a capricious hole in the wall, $40 a room for the year. You could heat Hades at that price and save enough of it to give the devil his due. Forty dollars would buy 7 tons of coal, enough for a small house in any city, but Boston—enough to buy eight years' supply of firewood. (One can't take over that time to get through college.) When we have money to burn we want something better than hot air.

It is understood by our contributor that slang is the basis for the use of the words "hot air," but he desires it to be put on record that "there is nothing better than hot air" for warming places to be occupied by men. He sympathizes with the Yale man and joins him in the sentiment that the faculty should teach their pupils to be deferential to the best that has been discovered for heating and to avoid irreverent allusions to it even when giving the faculty a blast. He would impress on the young men at Yale that the heating man insures comfort in all habitations for half of the year and that those who provide for an endless current of pure, fresh hot air are public benefactors, who should be placed on a pedestal and not made the target of slang phrases, even at the faculty's expense. Doubtless all manufacturers and contractors for indirect heating apparatus will join in the hope that not only the students at Yale, but all university men, will acquire plenty of money, but that with its accumulation they will learn that for warming buildings "there is nothing better than hot air."



Annual Meeting of Co-operative Stove Company,

The stockholders of the Co-operative Stove Company, Bloomington, Ill., held their annual meeting last week at the office of the secretary. The gathering was of more than ordinary importance, owing to the fact that the question of doubling the capacity of the plant and largely increasing the force of hands was to be decided. The official business was the election of directors, which resulted as follows: E. M. Hamilton, C. A. Hamilton, John W. Hayes, E. C. Hewitt, A. C. Hamilton, Henry Capen, Frederick Riegger, Otto Seibert, William Partridge, E. E. Donnelly and J. W. Aldrich. The directors then organized by choosing the following officers for the ensuing year: President, W. Hayes; vice-president, E. C. Hewitt; secretary, E. M. Hamilton; superintendent and treasurer, A. C. Hamilton.

After the election the question of finance was discussed and the reports of the retiring officers presented. These showed the business to be in flourishing condition, but it was decided to put forth extra efforts the coming year and use every effort to increase the volume of business to still larger proportions. To this end it was decided to make extensive improvements and increase the capacity of the plant.

The Torrid Zone Furnace.

A broken view is presented in Fig. 1 of the Torrid Zone furnace, manufactured by the Lennox Mfg. Company, Marshalltown, Iowa. This is a steel furnace, specially adapted to the use of soft coal, but also capable of using hard coal to advantage. This furnace has a sectional fire pot, made of either cast iron or fire brick. The fire bowl is constructed with crevices or orifices around the top edge through which the heated air passes freely in jets into the combustion chamber, aiding in perfect combustion of the fuel, and largely preventing the formation of smoke when burning soft coal. The heating surface being vertical, the accumulation of ashes and soot on the heating surface is almost wholly prevented. This insures good radiation and a large saving in fuel. Iowa soft coal has been burned for a whole

The Torrid Zone Furnace.—Fig. 1.—Broken View.

season in one of these furnaces with less than a quart of accumulations from all surfaces.

The fire pot has no connection with the hot air chamber, being inclosed with a solid steel body, thus completely doing away with the danger of a leakage of gas or dust through a packed joint or cracked fire pot into the hot air chamber and then into the house through hot air registers. This fire pot, not being exposed to the hot air chamber, gives indirect radiation through the steel body and thus avoids overheating the air before it goes to the rooms above, as is likely when the air is permitted to pass over a red hot surface. Moreover, the fire pot being capable of separate removal through the fire door, in whole or in part, without disturbance of the casing, the user is not without a fire more than two hours and thus avoids tedious delays and annoyance, and the expense is less than half as much for a new fire bowl as where the casing must be taken off and the

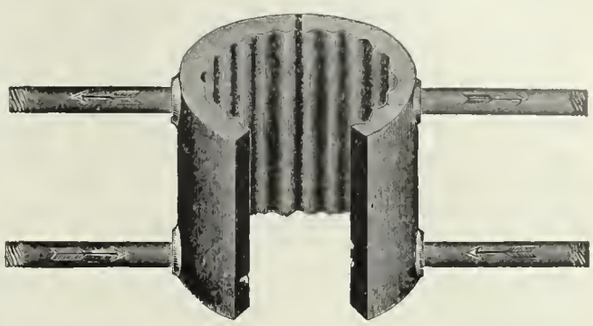


Fig. 2.—Water Heater for Combination Systems.

furnace and piping taken down in order to change the fire pot.

The furnace grate rocks like a locomotive grate, and is operated by a lever on the outside of the furnace. It is a practical shaking and dumping grate, being very simple and durable. It can be easily removed and replaced without disturbing other parts.

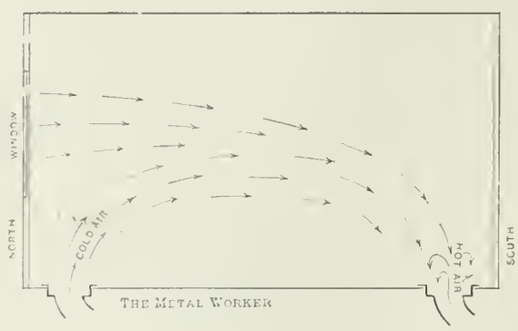
On each of these furnaces there is a diving flue, together with a direct draft that can be used when desired. The diving flue is crescent shaped and 42 to 48 inches high, according to the hight of the furnace, and is connected to the body of the furnace at the back by a self locking collar. The collar is made in two equal parts, one part fastened to the body of the furnace and the other to the diving flue before the furnace leaves the factory, and when the diving flue is set in place they make a connection similar to that of screwing a nut on a bolt by the locking of the two dovetails together, which enables a perfect connection at this point without the use of a bolt or key of any kind, and no matter how careless the workman may be.

The indirect radiator or diving flue is made with a hanging partition in the center of it that extends from the top down to 8 inches from the bottom. Near the top of this partition is placed a damper, and when it is closed the hot gases pass down the inner side to the bottom and return to the top on the other side. In this manner the heat is retained in the furnace that would otherwise pass out through the chimney and be lost. This indirect draft so materially aids the furnace in retaining its heat that no more heat passes out through the smoke pipe while there is a good fire in the furnace than is necessary to create a good draft.

This furnace can be converted into a combination hot water and hot air furnace by means of the water attachment shown in Fig. 2. This attachment is a hollow casting that takes the place of the fire bowl or lining in the furnace, and is heated by the fire directly against it. This manner of heating water overcomes one of the principal objections in combination furnaces: that of overheating water in extremely cold weather and not heating sufficiently in moderate weather. With this arrangement the water is equally well heated under all conditions of fire and weather. In other words, the heating surface for the water is not dependent upon the flash of the fire, but comes in direct contact with the hot coal, which makes it efficient at all times and all conditions of the fire. This is an important feature in combination heating.

The plant of the Prizer-Painter Stove & Heating Company of Reading, Pa., which was shut down for ten days to make necessary repairs, resumed operations on Monday, February 3. All departments are actively engaged and the outlook is promising for the coming season.

SOME HARD KNOTS IN FURNACE PRACTICE.



BY OLD ROSINHEAD.

I now have on hand two faulty furnace jobs to remedy, but they are none of my construction. I have been for the last eight or ten years very successful as a hot air furnace doctor, so to speak. Somebody else puts them up, and I have the fun of trying to make them work properly, if it is possible to do so.

The main causes of failure to work properly are: 1, improper location of furnace (some I find stuck away off in the south corners of a large rambling house, with the result that some of the rooms are naturally hard to heat, from the fact that they have northern exposure with large window area, and require pipes 30 to 40 feet long); 2, furnace not of sufficient capacity; 3, pipe too small to supply sufficient hot air to heat large, exposed rooms; 4, too much ventilation under the house; 5, too much ventilation in the rooms above; 6, too small cold air supply, and several other minor features.

The great trouble met with in handling one of these faultily constructed jobs is that people who are not disposed to pay for doing the job right, at the start, think you might do it in some other way that is not quite so expensive.

People have no cellars in this part of the country, and in some cases where a furnace is put up they only give you a hole under the house just large enough to drop a furnace into. When you tell them that it is necessary to move the location of the apparatus, then you get "sat

Some Hard Knots in Furnace Practice.

down on," sure. They cannot see why the furnace will not do just as well where it is. They are just like a man that I knew, who was sick and sent for a doctor. After four or five days the doctor saw he was not improving any, and began questioning him in order to find out what was wrong. The patient frankly told him that right at the start he had gotten the idea in his head that the doctor's prescriptions would not do him any good, and consequently he had not taken even one dose of the medicine.

The space is so cramped that in some instances you have almost to stand on your head in order to accomplish some parts of your work. Under one room in one of the jobs referred to there are four 18 x 36 inch ventilators open to the outside atmosphere. The other parts of the house are not quite so liberally provided with ventilators, but the temperature under the entire house is equal to that of a good ice house. Every room has a big open grate, and the heat from the furnace to the rooms downstairs chases itself up the flues so quickly that the furnace, being too small, cannot accumulate a supply of heat for the upstairs rooms at all. I tried to stop one of the grates by spreading a newspaper over the front. It slipped from my fingers, and the air pressure whirled it up into the flue equally as well as a Kansas cyclone.

Some furnacemen make all the short pipes as large as possible, while they make the long ones—those where the end is so far away that it is almost out of sight—as small as possible. I find some that would not make good water leaders.

I have one room that the furnace manufacturer says is air bound. I do not believe that I have ever seen a room that was built so tight that if a window was knocked out it would become air bound to cold air. I do not believe any one would tell you, "Oh, you need not mind that draft through the hole in the window; it will stop directly! There will be so much wind in here that no more can push into the room, and then the draft will stop."

Furnacemen say that a pipe to the north cannot work as freely as one in any other direction. Consequently they stop on the south side of the room, on account of retaining the pipe to short lengths. Result: If it is a north room there is a complaint of lack of heat; no heat, in some cases. In some instances you will find that it is carrying cold air to the furnace. Then you will hear some one say that it is air bound. The truth of the matter is the room is not air bound, but the south side is air compressed.

All so-called air bound rooms that have come under my observation are rooms with a northern exposure and having the register on the south side. One of these jobs, previously referred to, has such a room. But it has an open grate on the north; consequently it cannot be air bound in any sense of the word. The pipe is entirely too small, and only 8 or 9 feet in length. It cannot supply enough heat to overcome the intensity of the atmospheric condition of the extreme cold of the room. This is the room that has the four open ventilators under it. The illustration herewith shows the conditions to perfection. The currents of hot air have to "duck heads," "turn tail," and go back where they come from.

A Summer Stove Catalogue.

Catalogue No. 9, showing the Monarch line of summer stoves and ovens for gasoline, oil and gas for the season of 1902, has just been issued to the trade by the Monarch Stove & Mfg. Company of Mansfield, Ohio. The title page is followed by a full page view of the company's manufacturing plant. The opposite page gives the address of their various branch offices in New York, Philadelphia, Pittsburgh, Chicago, St. Paul, Des Moines, Lincoln, Neb.; Cincinnati, Kansas City and Denver. The early pages are devoted to the Monarch cabinet steel range, made with a 20-inch oven and five giant top burners, with a lift out top flush grate equipped with five cooking burners. These stoves are shown with right and left hand side cooking extension, are provided with non-corrosive feed, and are mounted on casters. Several pages show the Monarch New Method or evaporating process stove, with two and three burners, with and without end step and cooking burners. The generating or Old Method Monarch stove is also presented in a variety of styles, and the company's Junior stoves are shown in both high and low pattern of cabinet construction. These stoves are followed by an equally extensive, attractive and varied line of wickless blue flame oil stoves, made in both cabinet and high form and as Junior stoves.

The next section of the catalogue is devoted to the Monarch asbestos lined oven with drop door. These ovens are so made that they can be shipped in a knock down form, insuring their safe delivery without damage in transit. The concluding pages of the catalogue are occupied by some of the especially attractive gas heating stoves adapted for both natural and artificial gas, which the company put out under the name Monarch. At the end of the catalogue are given suggestions for ordering repairs, in order that mistakes may be avoided. The various parts are numbered on special cuts, and the price of the parts are also given in the catalogue.

THE trade will learn with regret of the sudden death of John D. Graff, a member of the well-known Stove house of Graff & Co., 909 Liberty street, Pittsburgh, Pa. Mr. Graff was born in Allegheny 37 years ago, and was the son of Thomas J. Graff, one of the pioneer Stove manufacturers of Pittsburgh, who, until his death in 1890, was a member of the firm of Graff, Hugus & Co. The firm continued until the consolidation a few years ago, when the Pittsburgh Stove & Range Company were organized. At that time John D. Graff was in charge of the plant at Sharon. From there he went to Monongahela City as manager. His successor is William Graham. Mr. Graff leaves a widow and three daughters.

The Stearns Molding Machine.

At a recent meeting of the Philadelphia Foundrymen's Association W. M. Potter of E. C. Stearns & Co., Syraeuse, N. Y., read the following paper on the Stearns molding machine:

Among the many mechanical arts that of molding in the sand is one of the last to suecumb to the uses of machinery. Steadily has machinery aided man in the produetion of the manifold wares demanded by civilization. Steadily has the prejudice of the worker given way until now, I think, among the last to aeknowledge and recommend the use of machinery is President Fox of the Molders' Union, who says that he indorses the use of molding machines and advises molders to learn to use them.

The molding machine which I have here, which I wish to demonstrate to you and to which I invite your inspection and attention, is of the class termed by some "squeezers," for the reason that it does nothing but press the sand and takes the plaee of the hand rammer. Other types of molding machines have their place and usages, sueh as the stripper plate type and others where the pattern is drawn by mechanical means. These machines, however, are mainly adapted to the production of pieces that are alike on both sides of the pattern—that is, the cope and the nowel are alike—but they are not well adapted to the various usages where snap flask or bench work is done in general foundry praetiee.

In order to put in use the Stearns molding machine nothing different in the way of flasks, patterns or follow boards is required; the only ehange neeessary being that the bottom boards should be made a loose fit, say, ¼ inch in length and in width smaller than the inside of the flask. I wish to say here that this machine is only intended for the use of manufacturers producing work in snap flasks on the bench, and it will not help a jobbing foundry where only a few castings at a time are made.

For the economical produetion of snap flask work the molding machine is indispensable to the modern foundry, and it has been the aim in the design of this machine to reduce the number of parts to the minimum, and also to so increase the leverage that the least exertion possible is required to operate it, so that a molder can produce a larger amount of work in a given time with less fatigue. Aside from the question of the reduction in the cost of molding the most noticeable feature in the use of the molding machine is the uniformity it produces in the castings. In the case of many castings that are made in our foundry, such as lawn mower wheels, where the wheels have an internal gear, the molding maehine added materially to the uniformity of this work, and in other instances where small pieces of hardware are required to assemble without machine work the molding machine has produced a uniformity in the work that was not even appreciated by ourselves.

I have here a casting of a card hinge pattern that we make in large quantities. I have taken this just as it left the sand, and before it enters the tumbling mills. in order to show you an illustration of what I refer to. This card of patterns is 8 x 20 inches. A molder operates 100 molds per day, and is pald at the rate of 2 cents per mold for all good castings that pass inspection and assemble properly. Most of this small hardware work is made not by molders, but by either apprentices or young men who have not worked long at the business. We believe it is a conservative estimate to say that from 25 to 33 1-3 per cent. more work can be accomplished with the use of machines than without them. Of course, this is for such pieces as the machines are adapted to. In this eonnection we wish to say that there are many pieces that are made on the bench for whieh we would not recommend a machine, as they can be done better by hand. This machine is so designed that the platen when thrown baek forms a regular bench that a molder can work on by hand and not use the machine portion of the ramming mechanism.

The increased output naturally decreases the cost of manufacture, making the machine pay for itself in a short time. In addition to the saving effected in the cost of castings, it is easier for the molder to produce his work. If paid by the piece he will earn considerably more per day than he would in putting up his molds with rammers, so that the manufaeturer can, if he wishes, afford to divide part of the saving with the molder. The molding maehine is of benefit both to the employer and the employee. The molder is as anxious to inerease his wages and lessen his labor as the manufacturer is to get a larger quantity with more uniformity and at a lower cost.

The Stearns molding machine is so simple in construction that no complicated instructions are required to learn to operate it, even by those not familiar with molding machines. This advantage will be readily understood by all foundrymen. In our own foundry we have had instances of men who had never seen the inside of a foundry commence work on a Stearns molding machine, and in three weeks put up 150 molds per day of an average elass of work in a flask of ordinary size.

I also have here brass patterns from the master patterns, so smooth that little or no work has been required in making the card of patterns. Formerly it cost from $30 to $50 to make a card of fine brass patterns such as these hinges. These are now by careful molding made smooth enough to require but little work in making the patterns. Any one producing a large quantity of pattern work can make great savings in this direction. I should be glad to give anybody information on this subject that feels interested in it. You may appreciate how little there is done on patterns when I show you these. When they break off from the gate, as we all know they do constantly where patterns are in frequent or continuous use, we simply mold these over and solder on new pieces rather than take the trouble to let in sheet metal gates.

In order to fully illustrate the foregoing paper Mr. Potter had on exhibition one of the molding maehines in the praetieal operation of making molds; various castings were also exhibited to show the class of work capable of being made on the maehine. In the course of the diseussion whieh followed the paper Mr. Potter said that the basis of price per mold as stated in his paper, 2 cents each, was probably a eheaper rate than would have to be paid in this neighborhood, but they had no diffieulty in getting the work done at those figures in their own foundry.

The Thatcher Furnace Company.

In accordance with the custom in New York City, the Thateher Furnace Company of 240 Water street have heretofore maintained a shop for the installation of heating apparatus. The growth of their business has now made it necessary that their entire attention be devoted to the wholesale trade. In consequence, at the first of the year the company sold out their tin shop and equipment to W. A. Lassin, 101 Beckman street, and they will hereafter install no furnaces or ranges. This no doubt will be regarded by the trade as a step in the right direction, as there has always been more or less objection to wholesale houses doing construction work. The Thateher Furnace Company by this new step will be enabled to push the Thatcher line with an increase of their characteristic energy. During the past year the company have added to their line of hot air furnaces, so that they now have heaters adapted to the requirements of all classes of trade. They have also completed their already extensive line of single and double oven ranges adapted for the cheaper building operations, and also for the finest residences of high class custom trade. The Thatcher line of steam and hot water heaters are equally complete. The company have extended their foundry at Newark, N. J., and other buildings and equipments so as to give them a greatly increased producing capacity and excellent facilities for filling orders promptly and shipping by the most direct route. The company now feel that they have, in the Thatcher line, goods in every way worthy of the attention of the most careful buyers, and they will now devote themselves exclusively to bringing their merits to the attention of the trade only.

ODD PLATES.

A. J. Lindemann of the A. J. Lindemann & Hoverson Company, Wilwaukee, Wis., who is spending a few days in New York, was a visitor at *The Metal Worker* office this week. He reports that the company, in addition to making an excellent line of Gasoline Goods, are now also prepared to furnish a fine line of Cooking Stoves and Ranges, Heating Stoves and Oaks for burning both coal and wood.

We have received from the Eclipse Stove Company, Mansfield, Ohio, a copy of the new calendar that they are distributing to the trade. The present calendar contains the first four months of the year. A second edition, comprising the remaining months, the company state, will be issued by May 1. On the upper part of the first page is given a view of the company's extensive Stove works, and the following monthly pages are headed by illustrations of some of the goods which have made the name Eclipse significant of all that is desirable in Stove and Range construction.

The S. Obermayer Company, Cincinnati, Ohio, with branch factories at Chicago, Ill., and Larimer, Pa., state that the year 1901 has proven to be the banner year in the sales for Foundry Facings, Supplies, &c., and the prospect for the current year, judging from the orders already in hand received during the month of January, bids fair to exceed any similar period in the history of their business. The company have recently established a branch at Pittsburgh, Pa., which will be operated in direct connection with the plant at Larimer, Pa. This move is an especially important one, as it places them in much closer touch with a territory of trade than heretofore enjoyed.

The Born Steel Range Company of Cleveland, leading manufacturers of Steel Ranges, are contemplating the erection of a large plant. An option has been obtained on a large building site in Newburg, near Cleveland, and the matter of erecting the plant is in the hands of a building committee, who are not yet prepared to announce their decision. If the new plant is built, the present large factory at Brooklyn will become a branch works.

The Mount Penn Stove Works, Reading, Pa., have resumed operations after the usual shut down for inventory and repairs.

The Mississippi Valley Stove Company, Fulton, Ill., manufacturers of Solar Stoves and Ranges and Bair Retort Down Draft Furnaces, have favored us with a beautiful wall calendar, consisting of a card of unusually large size, bearing a half-tone, reproducing a famous picture, "The Flight of Time." Attached to this card are leaflets for the months.

Oliver White, superintendent of the Stove works of Rathbone, Sard & Co., at Albany, N. Y., left on February 1 for Aurora, Ill., where he will assume charge of the extensive plant of the company in that city.

L. H. Solosth & Sons Stamping Works, successors to the Ornamental Stamping Works of Grand Rapids, Mich., advise us that they are manufacturing the World's Best Blue Flame Kerosene Oil Stove, for which they have succeeded in securing a large demand in their vicinity. They are also manufacturing a line of Stove Boards in addition to their regular product of ornamental sheet metal work.

Referring to the notice in our issue of January 25 of the division of profit with their employees made by the Scranton Stove Works of Scranton, Pa., the concern advise us that the 165 men referred to in the item in question as having benefited by the scheme did not include all the men in the employ of the company. Only this number out of a total of 275 employees qualified as recipients of the dividend under the terms of the plan. This profit sharing plan, the company claim, is an entirely original one, no similar scheme ever having been in force elsewhere, so far as known by the management of the Scranton Stove Works.

The Crystal-Garland Range is the interesting theme of an attractive circular just issued by the Michigan Stove Company. This is a six-hole Cast Range, adapted to soft coal or wood. It is presented to the trade as the latest creation of the company in the Cast Range line. Its appearance indicates that the pattern maker has endeavored to surpass himself in the design of the molded work and decorations. This Range is furnished with or without reservoir, is made on the interchangeable reservoir system, enabling merchant or consumer to change from square to reservoir at pleasure, and is also made in every size, style and kind known to modern Range construction. It has an aerated aluminized steel oven, draw out grate and combined pouch feed and broiling door.

G. L. Hergert, 210 Water street, New York, is exhibiting the Orelup Patent Attachment for increasing the efficiency and economy of Furnaces and Stoves. This consists of a special construction of Drums, and has been patented by A. Orelup, 1352 Groveland avenue, Chicago, Ill.

The Right of Discharge Upheld.

A recent decision of the Supreme Court of Ohio in the case of the Nickel Plate Railway *vs.* Frank Shaffer, involving the use of the "black list," sustains the position of the railroad company. Shaffer was discharged by the company for participating in a strike. He claimed that he could not secure employment on any other road because the company refused to give him a certificate of service, and he sued for damages. The Circuit Court pronounced a judgment in favor of Shaffer, which judgment has just been reversed by the Supreme Court, the ruling of which is as follows:

A master is under no legal obligation to give to his discharged servant a statement of his service and whether or not it was satisfactory, and a discharged railroad employee cannot maintain an action for damages against the company who discharged him for refusal to furnish him with a clearance or statement of the record of his service, although he may have been unable to obtain other employment in consequence of such refusal by the company.

It is the right of every person, natural or artificial, to employ or refuse to employ in his business whomsoever he may wish, and he cannot be called upon to answer for his judgment in that regard by the public or individuals, nor can the motives which prompt his action be considered. A railroad company may lawfully refuse to continue in their employ a person who has engaged in a strike affecting their interests, or who has shown himself to be negligent, incompetent, inefficient or dishonest.

Proposed Permanent Exposition in Mexico.

The project of establishing a permanent exposition of native and foreign products in the City of Mexico, which has been under consideration for some time, is likely, says United States Consul William W. Canada of Vera Cruz, soon to be an established fact. A contract has been signed between the Mexican Government and José Landeros Cos. representing a company, by which a concession is granted to the latter to establish a permanent exposition, the buildings for which shall be finished within three years and cost not less than $300,000 in Mexican currency. The concession is for a period of ten years. The agreement has already been approved by the lower House of Congress, and it is expected that it will meet the approval of the Mexican Senate.

The administration of the exhibition will promulgate its rules and regulations, approved by the Government, in English, French, German, Spanish and Italian. A yearly catalogue is also to be published in the same languages, containing a descriptive list of all the articles exhibited. All material necessary for the construction of the buildings, as well as samples of foreign products, will be admitted free of duty under a bond guaranteeing that they are for the use of the exhibition only. Any samples so imported which have not been sold or re-exhibited within one year will, however, be assessed the usual duties. All articles sent for exhibition must be accompanied by a statement giving the name of the manufacturer or producer, or his agent, the name of the article, its application, price and all other necessary data.

Features of the Peerless Refrigerators.

The Wisconsin Refrigerator Company, Eau Claire, Wis., have introduced a number of special features in their Peerless line of refrigerators, which are herewith illustrated. Fig. 1 shows a refrigerator with the door

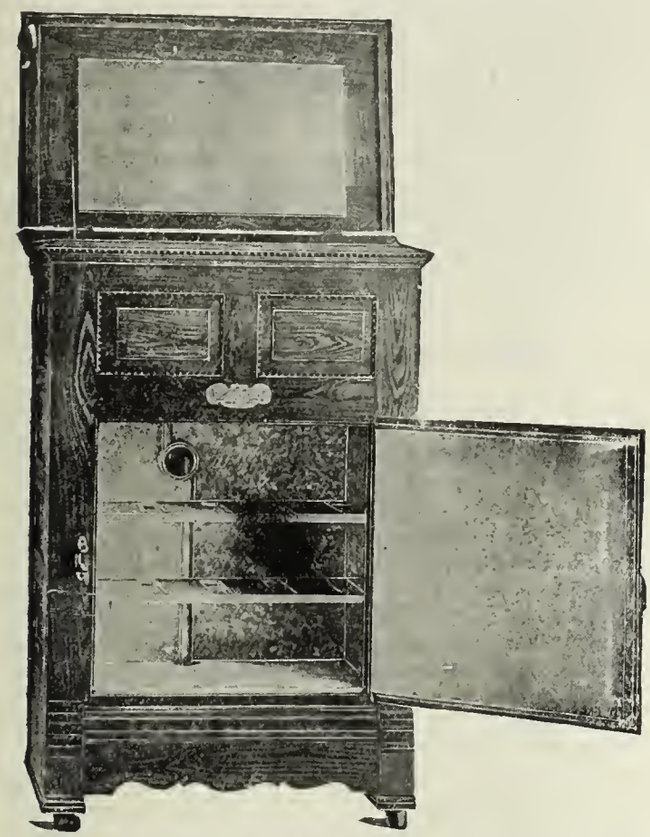


Fig. 1.—Peerless Refrigerator.

to the provision chamber open, to enable the arrangement of the interior to be seen. Fig. 2 illustrates the new drain pipe and drip cup. The drain pipe and drip cup are removable for cleaning, by raising the cup enough to release it from the lower pipe and giving the

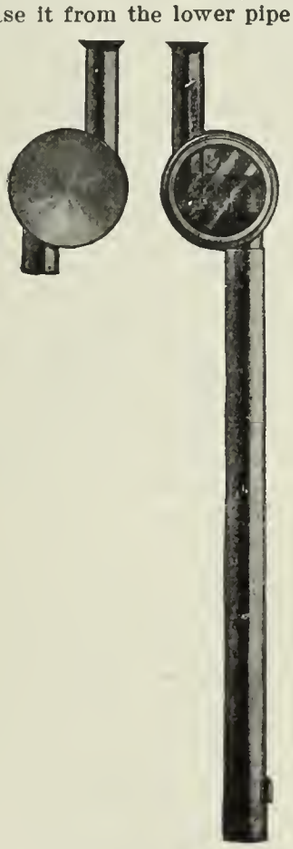

Fig. 2.—Drain Pipe and Drip Cup.

cup a half turn to the left. The upper and lower pipes can then be easily removed. The cup is circular in shape and is constructed so as to form a trap. It fills with the drainings from the ice and overflows into the downward pipe, thus preventing the possibility of cold air escaping from the ice chamber or warm air entering from the outside of the refrigerator. The cup has a glass front, which enables the interior to be easily inspected, so that any collection of refuse can be detected which might clog the pipe and cause water to overflow into the provision chamber. Fig. 3 shows the improved ice rack, which is made entirely of metal and braced and riveted in such a manner as to give the greatest possible strength. The arched shed under the center of the rack, covering the opening directly entering the provision chamber, is constructed so as to prevent the drippings from condensation passing into the provision

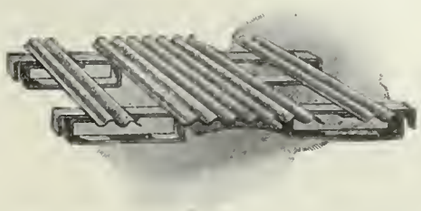

Fig. 3.—Improved Ice Rack.

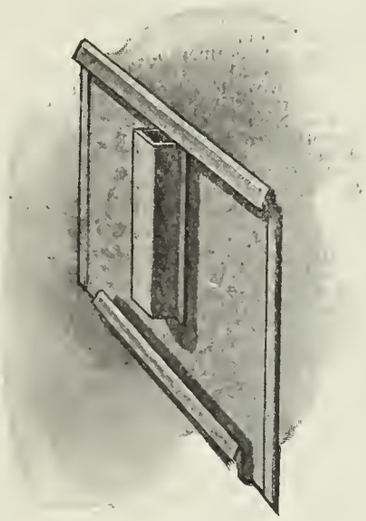
chamber, and its open construction to give the quickest possible circulation of dry air to the food in the provision chamber below. Fig. 4 shows the new cleanable flue wall. This is a flue within a flue. The square hollow device attached to the center and inner side of the wall is a reinforcement to the wall, giving great strength, and acts as a second draft, greatly aiding in the rapidity



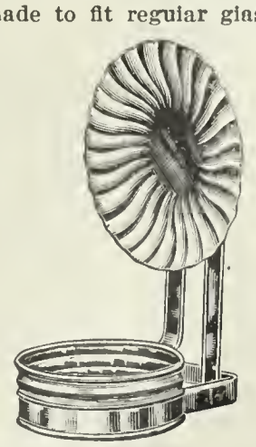


Fig. 4.—New Cleanable Flue Wall.

of the circulation. The upper edge of the wall is shaped inward and extends over proper points at the top, holding it in its final position. The bottom of the wall is shaped so as to carry off all condensation direct to the drain pipe.

The Utility Lamp Bracket.

The accompanying cut shows a lamp bracket offered by the Utility Mfg. Company, 16 S. Frederick street, Baltimore, Md. The bracket is provided with a reflector, and is made to fit regular glass founts. It is

The Utility Lamp Bracket.

japanned a glossy black, and is referred to as being strong and neat. The brackets are packed one gross in a case.

THE PACIFIC RETAIL HARDWARE ASSOCIATION.

The fourth annual meeting of the Pacific Retail Hardware Association convened at Nevada City, Cal., January 15 and 16. Nevada City being a town in the Sierra Nevadas, it was feared that storm conditions might interfere with the attendance, but the weather was unusually pleasant, and the attendance of retail hardware men, manufacturers and others interested was large, the meeting proving a highly satisfactory one. The convention was called to order by the president on Wednesday morning at the Masonic Hall, the following firms and members responding:

Adkins & Drane, Red Bluff.
R. M. Beebee, Gridley.
Bills & Putnam, Oroville.
Billiou & Applegate, Saint John.
J. P. Burbank, Anderson.
J. E. Boorman Hardware Company, Marysville.
R. B. Cranston, Woodland.
Ed. G. Carter, Cottonwood.
W. M. Doty, Biggs.
Denny-Bar Company, Scott Valley.
Elam Biggs Hardware Company, Grass Valley.
Epplnger & Co., Dixon.
Estate G. W. Freeman, Willows.
J. Grover, Colusa.
B. P. Grover, Williams.
T. B. Gibson, Woodland.
Hampton Hardware Company, Marysville.
L. L. Hubbell, Chico.
Hubbard, Earll & Co., Chico.
Robert J. Hancock, Auburn.
Hochheimer & Co., Germantown.
John Haenny, Lincoln.
L. O. Johnson, Arbuckle.
J. D. Johnson, Dixon.
R. O. Kimbrough, Sacramento.
Kaufman Bros., Corning.
H. D. Knight & Bro., Elk Creek.
Estate J. P. Klemmer, Willows.
Legg & Schaw, Nevada City.
Lyon & Garrett, Red Bluff.
McCormick-Saeltzer Company, Redding.
J. A. McFeely, Chico.
Mitchell & Son, Colusa
C. J. McBride, Lincoln.
A. L. Nichols, Chico.
R. Noell, Grass Valley.
Scribner & Murdock, Orland.
John L. Swank, Colusa.
John Simpson, Tehama.
A. C. Stagner, Wheatland.
Benjamin Smith, Maxwell.
Lewald & Schlueter, Fresno.
Geo. E. Turner, Nevada City.
White, Cooley & Cutts, Marysville.
H. A. Scribner, Durham.
W. E. Hawkins, Ager.
H. G. Dorsch, Quincy.
M. Q. Meehan, Placerville.
Pioneer Hardware Store, Placerville.
E. L. Reid, Junction City.
Fred. A. Autenreith, Yreka.
S. Swect & Co., Visalia.
Dinkelspiel Bros., Bakersfield.
Redlick Bros., Bakersfield.
L. N. Wood, Visalia.
Linder Hardware Company, Tulare.
Bakersfield Hardware Company, Bakersfield.
A. Young, Tulare.
Barrett-Hicks Company, Fresno.
Donahoo-Emmons & Co., Fresno.
Turner Hardware Company, Modesto.
W. B. Wood & Son, Modesto.
Ruhl Stove & Hardware Company, Stockton.
A. Watkinson, Corning.
E. F. Reichman & Co., Fort Jones.
Brady & Cassidy, Grass Valley.
G. H. Knight, Adin.
Bird & Dinkelspiel, Colinsville.
Thomas Jones, Hornbrook.
E. B. Cavanaugh, Edgewood.
Ophir Hardware Company, Oroville.
Francis & Johnson, Auburn.
Owen Sullivan, Colusa.
Lord & Murray, Woodland.
J. F. Brown, Rio Vista.

Delegations from the San Francisco and Oakland Retail Hardware Association and from the newly formed Central California Association were also present. After an address of welcome on behalf of the citizens of Nevada City and Grass Valley by George A. Legg, the president, John C. White delivered his annual address, which was of an interesting and encouraging tenor. The report of the Executive Committee, which was read by Vice-President Oscar C. Schultze of Dixon, Cal., showed the association to be in a flourishing condition. Mr. Schulze subsequently read a very interesting paper on "Reciprocity in Trade." Among other papers which were read and discussed were one by G. A. Gutman of Germantown, Cal., on "Suborganization," and an interesting paper on the "Social Side of Business Life," by A. F. Brady of Grass Valley. These papers were kindly received by the convention, and a vote of thanks tendered those who prepared them.

The city of San Francisco was selected as the place for holding the fifth annual meeting, when it is the expectation and aim to hold a joint convention of all the retail hardware associations in the State of California.

The following officers were unanimously elected to serve for the ensuing year:

John C. White, president, Marysville, re-elected.
Oscar C. Schulze, vice-president, Dixon, re-elected.
Wm. Earll, treasurer, Chico, re-elected.
Robt. W. Boyd, secretary, Marysville, re-elected.
A. F. Brady, member Executive Committee, Grass Valley.
T. B. Gibson, member Executive Committee, Woodland.

The chairman reappointed the Auditing Committee, consisting of Elam Biggs, Grass Valley, Cal.; John Simpson, Tehama, and J. F. Sersanous, Willows, Cal.

The convention closed with a banquet. The meeting was a notably, successful one, and the association is to be congratulated on its position and influence.

Stove and Hardware Dealers.

The Chicago Solar Light Company, manufacturers of the Nulite Incandescent Vapor Gas Lamps, 132 to 134 Lake street, Chicago, state that the demand for their Lamps has grown beyond their expectations. The increase in their business has more than quadrupled in a year. They believe that this increased demand for their Lamps has been caused by the excellence of the workmanship. They have just issued interesting circulars which give a full description of the variety of Lamps which they have brought out and the special features of each style of construction. The variety shown comprises Table Lamps, Student Lamps, Single Pendants, Chandeliers for 2, 3 or 4 lights, Wall Lamps, Street Lamps, Outdoor Arc Lamps and Indoor Illuminators.

The W. J. Clark Company, Salem, Ohio, are sending out their catalogue No. 4 of 40 pages, descriptive of their Quick as Wink Hose Coupling, which can be adapted to a great variety of uses. It is stated that the small sizes of these Couplers are extensively sold to users of compressed air for use on hose connected with pneumatic tools and machines. The catalogue is copiously illustrated and gives numerous testimonials from fire department officials, large manufacturing plants, &c.

F. J. Knesek, Moulton, Texas, dealer in Hardware, Tinware, Crockery, House Furnishing Goods, &c., requests that copies of catalogues, price-lists, &c., be sent to him in regard to the above lines. Mr. Knesek was formerly in business in Schulenburg, but has lately moved to Moulton, where he had just completed a new building when it was destroyed by fire. Mr. Knesek had not, however, moved in his stock, which was thus saved from destruction. He has already contracted for a new building to be made ready with all possible haste.

A patent was recently granted to P. A. Myers of the firm of F. E. Myers & Bro., Ashland, Ohio, for an improvement in Horizontal Force Pumps, which is said to simplify the construction in a great degree and covers broadly the feature of grouping the suction and discharge valves in such a manner as to render them readily accessible. The patent covers the line of Century and Bulldozer Pumps manufactured by F. E. Myers & Bro.

The White Mountain Freezer Company, Nashua, N. H., have just issued a finely printed descriptive catalogue, illustrating the various forms of the White Mountain Freezer, together with illustrations and reference matter of the various parts for repairs. In it are shown Hand Freezers, with both crank and fly wheel; Freezers for hotel and confectioners' use, Combination Gear Frame Freezers, Platform and Power Freezers and the Junior or Toy Freezer. The latter will make a pint of perfect cream to amuse the little folks or supply the sick room. In the back are shown Freezer and Packing Tubs and Cans and the Improved Arctic Freezer, the latter a single motion machine more moderate in price. On the covers, front and back, are White Mountain views. The catalogue will be sent to any interested dealer on application.

The Smith Mfg. Company, Waynesboro, Pa., have had their new manufactory upon which they entered last May running to its fullest capacity ever since, and have

contracts secured that will keep them fully engaged up to May 1. At present they are making $25,000 worth of Galvanized Ice Cans for the Frick Company, Waynesboro, Pa., and $3000 worth for the Crystal Ice Company, Kansas City, Mo. They have also a number of other smaller contracts that will totalize $30,000.

S. I. Newcomer has bought the McKibben Hardware, Stove, Agricultural Implement and Sporting Goods business, at Lanark, Ill., and will continue it on a cash basis.

The St. Louis Retail Stove and Hardware Dealers' Association, in conjunction with the manufacturers and jobbers of the city, will tender a banquet to the members of the Missouri Retail Stove and Hardware Dealers' Association, whose annual convention will be held on the 18th and 19th inst. The banquet will be given at the Mercantile Club, St. Louis, on Wednesday evening, 19.

The sixth annual convention of the Wisconsin Retail Hardware Association was held at the Republican House, Milwaukee, on Wednesday and Thursday, February 5 and 6.

A Market Phenomenon.

The reported action of the steel manufacturers in deciding not to advance the price of soft steel bars emphasizes the peculiar conditions which now prevail in the iron and steel trades. Here we have the unusual spectacle of a meeting of manufacturers, undoubtedly called for the purpose of agreeing upon an advance, and with everything favoring such a decision, agreeing not to do so. It is a most unexpected position to take, as the trade had been prepared for the announcement of higher prices by the stiffening of quotations generally and by the increasing difficulty in finding manufacturers able to take orders for reasonably early delivery. It can safely be assumed, with no precise knowledge of the proceedings of this meeting, that the decision not to advance prices is due to the attitude of the largest manufacturers rather than to the conservatism of the rank and file. While this attitude is commendable for most important considerations, it is such a departure from the usual course of market events as to be noteworthy. It is, however, in conformity with a number of other occurrences during the past nine months in which prices of steel products have not been adjusted according to general expectation. They have not been marked up when conditions seemed to perfectly justify such a procedure, and they have sometimes been marked down when but for such action they would have gone soaring. A new era, therefore, seems to have dawned. It is an era in which present profit is not considered so much as the cultivation and preservation of a sustained demand. The remarkable circumstance is presented, and indeed has for some time confronted us, of order books filled to overflowing, with finishing departments hungry for more material, while prices show little evidence of the existence of more than a fair demand.

This has caused the iron and steel market to be really stronger than it appears. Such a market phenomenon as this has been known before, but only for a brief time and not on any great range of products. In the early stages of a boom it is manifested, of course, but otherwise it has only occurred when temporary conditions restricted the supply of some particular commodity. Never before, during a period of absolute freedom from excited buying, has this phenomenon of extraordinary market strength existed to such a great extent as now obtains. In pig iron, bars and structural material particularly the published quotations of prices asked by manufacturers are for deliveries which are hopeless for the buyer who finds that he will shortly need additional supplies. In the steel rail trade the same prices are quoted as were current months since, but not a mill can be found in position to guarantee delivery before October. The strength of the rail situation is most convincingly shown by the prices now being paid for relaying rails. Such rails, partly worn, and usually sold at 25 per cent. less than new rails, are now worth the full price of new rails.

It is true that in a few lines, such as sheets and tubes, the multiplication of new mills has proceeded so rapidly of late that prices are not so strongly held. Taking the steel trade as a whole, however, the volume of business now in progress is so great that when weakness does develop in one branch it is not likely to become acute but will speedily correct itself. This was the case in wire products. What happened in that line is likely to be repeated in the others. The general volume of business is so large, and has been so well sustained by the policy of maintaining reasonable prices, that the supply of raw materials is not running in excess of the demand and therefore they are not cheapening in price. This keeps up the general cost of manufacture and prevents the slaughter of values in any branch in which the product may appear to be exceeding the demand. High cost and low selling price are not conducive to serious attacks on the market. A great balance wheel is thus in operation, which checks a boom.—*The Iron Age.*

The Commercial Element in the Trade School.

The value of the commercial element in the trade school, says George I. Alden, in the *Southern Workman*, is shown in three respects. First it furnishes the best standard with which to test the work of the student. The commercial standard is best because it is the one to which the student must conform in the practice of his trade, and the efficiency of the trade school in this particular line will be judged by the ability of its graduates to meet readily and quickly the commercial requirements of the trade which they have been taught.

But the commercial element in a trade school is valuable also because it secures the best development of the pupil. The idea that a trade can be better acquired or the pupil better trained by working on useless pieces or designs than by practice on real work demanding commercial standards, will not be likely to revive until medical students are excluded from hospitals where people are sent to be treated and allowed to take their practice in the laboratory and deal with skeletons, manikins and dead bodies, rather than with living patients.

The commercial element may also have a pecuniary advantage. In the construction and furnishing of buildings or in making articles for sale in the market the students in the trade schools may be more or less profitably employed.

If the commercial element in the trade school may be so used that 1. it sets a better standard for the students' work; 2, gives the student better training of all his faculties, mental and physical, and 3, may be made of financial advantage to the school, then its importance can scarcely be overestimated.

TRADE NOTES.

The National Gas Saving Company, with a capital of $25,000, have been organized at Baltimore, Md., with Charles H. Hershey, president; C. E. P. Brewer, vice-president; Thomas M. Dukart, secretary, and C. M. Harkins, treasurer, to manufacture a patented Gas Saving Tip.

The Canton Roll & Machine Company, Canton, Ohio, have more than doubled their capacity during the past year and are turning out from 75 to 80 tons of castings per week. They are about to commence work on another addition.

The Southern Asbestos Mfg. Company, Richmond, Va., are about to make extensive improvements and enlargements at their plant.

G. R. Lynch, who has been general manager of the Chattanooga Steel Roofing Company, Chattanooga, Tenn., for 11 years, has resigned to accept the management of the Aurora Acetylene Company, manufacturers of Aurora Acetylene Gas Generators. They have one of their machines on exhibit at Charleston, S. C., which is attracting much attention, we are told. The Steel Roofing Company grew rapidly under the management of Mr. Lynch and are now one of the largest manufacturing concerns in Chattanooga. On Mr. Lynch's retirement the employees presented him with a very handsome silver tea set.

A Protection Circular.

The following circular, which is being sent to the plumbing trade, is interesting in view of the fact that both the plumbers and the wholesale trade are acting under special sets of resolutions which are somewhat at variance:

National Association of Master Plumbers of the United States.

THE NATIONAL ASSOCIATION OF MASTER PLUMBERS STANDS FOR PROTECTION OF MEMBERS ONLY.

A CONTRAST.

Formerly gas fixture dealers were the exclusive dealers in gas fixtures. To-day department stores, hardware merchants and gas companies sell these goods, and the owner or contractor can buy anywhere and have the work done by journeymen. Why?

There was a time when the master painter sold nearly, or all, the paints used. To-day you find paints on sale everywhere, and the former master painter simply a journeyman. Why?

Druggists to-day are obliged to compete with the department store, the retail grocer and the "cure-all doctor." Why?

Carpenters, masons and plasterers once protected. Now the owner or agent can buy at wholesale, while the masters simply do the labor. Why?

DO YOU KNOW THE PLUMBING BUSINESS IS THE ONLY BUSINESS PROTECTED, AND NOT CUT INTO BY OUTSIDERS? IT'S A FACT, THOUGH, AND THAT IS JUST WHAT

THE NATIONAL ASSOCIATION OF MASTER PLUMBERS STANDS FOR; PROTECTION TO ITS MEMBERS.

That's the reason why you should be a member and share in the benefits it brings to the master plumber.

FROM A BUSINESS STANDPOINT

every master plumber should be a member, for the Cleveland Resolutions confer distinct benefits upon members, which are not enjoyed by nonmembers. Have you read the resolutions? If not, ask for a copy.

RECOGNIZED MASTER PLUMBERS.

The Cleveland Resolutions provide that in localities where there are members plumbing goods shall be sold only to master plumbers who are recognized by the National Association as master plumbers, and whose names appear in the National Directory.

To illustrate, take a locality where there are no members, and the jobber or master plumber sells to the consumer, the nonmember would receive no redress. He must see his legitimate profits lost, for he has no right to complain.

BAD DEBTS.

Sections 6, 7 and 8 bring just the protection every one wants. If you are a member you are protected.

ESTIMATES AND DISCOUNTS TO CONSUMERS

by manufacturers or jobbers are condemned and the member is protected, while in localities where there are no members the plumber would surely have trouble with his customer and his trouble would be all his own.

NON MEMBERS

must not expect the National Association or its members to interest themselves in the welfare of those not sufficiently alive to the best interests of their business success to become members of the association that protects members. E. D. Hornbrook, President.

Kansas City, Mo.

Cleaning Small Sewers.

In reply to a correspondent of *Municipal Engineering*, Warren Goodrich of Whitehall, N. Y., contributes the following on the size of small sewers and the cleaning of them:

In the first place, your 6-inch pipes are too small for any practical use as a public sewer. Nothing less than 8-inch should be used for public work. Perhaps the grade is at fault. I always try to obtain a grade of at least 1 inch per 50 feet, if possible. Perhaps too much surface dirt is allowed to drop into the pipes, and I have found that nothing clings to the inside of a sewer pipe worse than sand or ground stone that has been crushed by wagon wheels. If the blockade is caused by roots nothing will cure it except relaying the pipes and making the joints perfectly tight with the best cement.

Now, to remove the obstruction, if you have a water system with good pressure, or any means of forcing water into the pipes, take one length of hose, cut off the coupling from one end, insert the cut off end into the sewer pipe below the obstruction, push the hose in as far as possible and turn on the water. If the blockage is loose material the inrush of water will loosen it and the backrush of water will bring it back down hill. I have tried the plan in very obstinate cases and never yet failed to open the pipes; but you must attack the blockade from the lower end so that the water can undermine it and have a chance to run away. If you attack on the upper end you help to pack the blockade and fill your pipe and excavation with water.

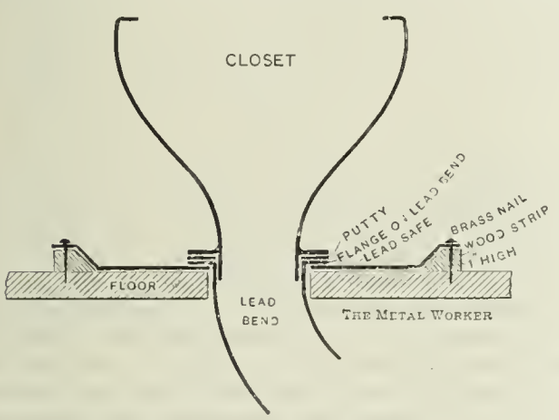
The minimum gradient for self cleansing an 8-inch sewer is about 1 in 400, or 1½ inches in 50 feet, which is 50 per cent. more than is named; for a 6-inch sewer the minimum is about 1 in 300, or 2 inches in 50 feet. Sewers laid on less gradients than these will certainly require regular attention to keep them from stoppage, and those laid on greater gradients will occasionally give trouble from deposits not caused by large objects wedged in the sewer or by tree roots.

THAWING CONDUCTOR PIPES.

BY B. W. G

An unusual provision on a steam heating plant may be interesting to a contracting steam fitter, even though he may not desire to take up with it in his general practice. Just such a piece of work as might come under the above description I was called upon to do to gratify the views of a customer. This customer had a friend who had melted the snow on the pavement in front of his factory by the use of steam through a steam hose leading from the connection on his power boiler. This led him to the conclusion that he could utilize the steam generated in the low pressure steam heating system in his residence for thawing out the ice which formed every winter in his conductor pipe. He insisted that it would be a comparatively small matter to arrange for a similar appliance to be attached to his piping. Upon a little consideration objection to the use of his house heating boiler for this purpose was pointed out, but, as is usual in such cases, even though the arguments were good he seemed to think that a thawing apparatus was the one thing that would make him happy. It may be readily seen that this method of thawing would involve the waste of some of his steam and necessitate replenishing of the boilers with water. To meet these requirements one of Lawler's automatic boiler feeders was connected with the boiler. In running the heating main at points where it was nearest to the rain water conductors tees were placed in the main and provided with nipples and ells, so that the ells faced directly toward the rain water conductors. A globe valve was attached to the ell, and beyond the valve arrangements were made for connecting a steam hose.

Everything, so far as the heating plant is concerned, is ready for the experiment of thawing the rain water conductor, but no report has yet been received that it has ever been used for this purpose. Whether this is due to the failure of the owner to remember the thawing apparatus or from a lack of necessity to make use of it is not known. Any practical man can readily see that, to be efficient, the boiler ought to carry at least 5 pounds of pressure, if it was to be used for thawing. Even if but one conductor was being thawed it can be readily seen that unless the boiler was fired heavily the steam pressure would easily go down and leave the house without a heating medium. To be successful on a cold day when all the radiators were in use the boiler would necessarily have to have a considerable excess power over what is ordinarily provided in a house heating plant to do the extra work of thawing successfully, or it would have to be fired hard. Then to change the incoming water to steam at a pressure to replace the steam used in thawing would probably cause some hitch, especially should several pipes be subjected to the thawing process at the same time. However, my customer has all the appliances ready for use whenever he may wish to use them. He has also been fully informed of all that is likely to happen in case it is used.



The American Radiator Company have declared the regular quarterly dividend of 1¾ per cent. on their preferred stock, payable February 15.

LEAD SAFES FOR WATER CLOSETS.

BY J. N. S.

The common practice of setting a water closet on the bare wooden floor with putty, whether it be of the wash-out kind or syphon jet, should be condemned, for the reason that the putty saturates the floor with grease and people think that there is a leak under the closet. They see the grease and think that it is water. If there cannot be a lead safe placed under the closet to catch a leak from the coupler or from any other source, there should at least be a piece of sheet lead set on the floor a little larger than the closet. Then the upper end of the lead closet bend or soil pipe should be turned over on the sheet lead. The closet can then be set with putty and screwed firmly down so as to squeeze out all the surplus putty. The sheet lead should then be cut neatly around the bottom of the closet. This will prevent the putty from soaking into the wood and obviate the grease stain.

But I am firmly of the opinion that there should be a lead safe under every closet that has not a water proof floor under it. I have known water closets to overflow, even when set on a marble slab, and the dirty water come

Lead Safes for Water Closets.

down through the ceiling, staining it permanently. A lead safe is not an unsightly thing if it is put in properly. With neat beveled strips about 1 inch high, 2 feet square or whatever the space allowed for that purpose, the sheet lead can be dressed down all around, so that it will fit it neatly and snugly, and then be tacked down with brass headed nails. This safe will prevent the floor from getting saturated with urine, and should there be an overflow, it can be wiped up and not go down through the ceiling, destroying its appearance.

Central Heating Plant at Owatonna, Minn.

A central heating plant is in successful operation at Owatonna, Minn., in connection with the works of the Owatonna Electric Light & Heating Company, using exhaust steam from engines and flue gases to heat water, supplemented by live steam when necessary. Two 15 horse-power pumps force the water through 4 and 6 inch pipes and ½-inch house services, laid in wooden casing filled with mineral wool. When the temperature of the air is 40 degrees the water is forced through the pipes at a temperature of 140 degrees under 10 pounds pressure; when the temperature drops to 20 degrees below zero the water is heated to 200 degrees and forced through the pipes at 40 pounds pressure. At a low temperature it is estimated that a 100 horse-power boiler will furnish heat for 15,000 square feet of radiating surface, but in moderate weather it will supply 25,000 square feet. The loss of heat in the water in the circuit is 20 to 25 degrees. Two miles of mains were added during the past season, this more than doubling the length since the plant was established a little more than a year ago. The amount of radiating surface in use has quadrupled.

The decision of the Michigan State Supreme Court in the case of the United States Heater Company of Detroit against members of the Detroit branch of the Iron Molders' Union of North America, sustains the constitutionality of the act of 1897, which permits the suing of unincorporated associations, "composed of five members or more, having some distinguishing name." The attorneys for the union contended that the act was unconstitutional, because it was aimed particularly at the labor organizations. The Supreme Court does not sustain this contention.

A DISAPPOINTED SALESMAN.

BY SYMPATHY.

Sometimes when the employer is quibbling over the expense account or finding fault with salesmen, he does not take into consideration some of the serious disappointments which the salesmen receive after expending their best efforts. Even the salesmen themselves will confess that there are times that a little "bracing" is not altogether amiss. A short time since a Western salesman accompanied a local customer to the office of an architect, to lend his assistance in determining what was necessary for heating a building, and to endeavor to get his goods specified. While there a wealthy cattle grower dropped in to consult the architect in reference to a large summer residence for which the architect had completed the plans. The cattle grower became interested in the conversation on heating and invited the architect to bring out the plans of his building, so that the embryo engineer could give some assistance and suggestions as to the proper means of heating it. The young man knew that here was an opportunity, and worked "overtime" without any expectation of "union pay" to secure this order.

He so thoroughly imbued the cattle grower with the idea that he must have a heating system in his house and that the apparatus which the young man had for sale was the only one that could be adopted for the work that the owner told the architect to consider the heating matter in the contract closed and to award it to the local heating contractor when he had received the estimate and agreement as to what work would be done. He further said if the young man and the heating contractor would call at his house in the evening he would sign the contract himself, so that the goods could be shipped without delay and the whole matter closed. The salesman was delighted and, after helping the local contractor to make the estimate and draw up a proper contract, went to his hotel for supper and wrote to his house that he had not only settled with the architect about the heating of one plant in mind, but also had sold another complete plant, and had only to go and see the customer to have the contract signed after supper.

In the evening, with the heating contractor, he repaired to the residence of the cattle grower. With true Western hospitality the host met them at the door, but with the discouraging remark that he was sorry that he had spoiled their evening, as his wife had refused to consider the heating apparatus in question. Instead of taking this rebuff as final the salesman asked if he might have the opportunity of explaining the merit of his system to the good lady. The cattle grower replied it would afford him pleasure, and he was shown into the family circle, and the owner's wife listened to the best lecture on heating which the salesman had ever given in his life. Having admitted all the claims that he made as a result, the salesman asked the lady if it would not now be a good time to sign the contract. She replied that there was one question that she desired to ask, and if that could be satisfactorily answered there would be no objection to signing the contract. She stated that the new residence was to be used only as a summer residence and that she never expected to be in that house with any of the family at a time of year when fire would be needed to furnish a comfortable temperature. Under these circumstances she desired to know why on earth it was worth while to think of putting in any kind of a heating system? In face of such a question there was only one thing for the salesman to do, and that was to write to his house before he went to bed that the deal with the cattle grower was off.

How to Use the U-Gauge.

The Denver (Col.) Gas & Electric Company have issued to their employees the following instructions for using the U-gauge to assist in locating causes of complaints:

Employees in the gas department must familiarize themselves with the U-gauge, which can be made of great value in locating causes of complaints arising in the use of gas appliances, and especially fuel appliances. Congestion in the service pipe, meter or meter connections is often the source of unsatisfactory results, and may cause excessive bills. Every gas appliance has some favored rate of gas consumption at which it will do the most economical work, and generally the most satisfactory work. A stoppage in the pipe may reduce the flow to a rate much below this.

In measuring pressures for obstructions we are most interested in the drop in pressure between two points, and not in the absolute pressure. To locate the point of congestion in the supply pipe, the gauge should be attached at the furthest point from the source of supply, the street main, and enough gas used at some point remote from the source of supply to cause a considerable fall in pressure; then, by successively attaching the gauge at points nearer and nearer the source of supply, the congestion may be located, providing all the congestion is at one point. The point of congestion will be readily noticeable by reading the pressures on the U-gauge. If the fall in pressure is considerable but uniform from point to point, it merely indicates that the quantity of gas flowing is greater than the capacity of the pipe, but if a particular drop in pressure occurs between two points, it clearly indicates that the congestion exists between these two points.

This drop in pressure must necessarily be influenced by the quantity of gas demanded or in use. Assuming that you have, say, 20-tenths pressure in the main, you will have at this altitude in the house exactly the same pressure, provided no gas is being used, even though there is a passageway only as big as a pinhole at the congested point. If gas is being used the pressure is dependent upon the quantity flowing, hence to determine whether serious congestion exists in the pipes the pressure must first be measured, at some convenient point in the pipe, with every burner on the premises turned off, and must again be measured at a point remote from the street main with the maximum quantity of gas flowing, and which is, therefore, demanded. If an excessive drop in pressure occurs the pipe is either obstructed or too small for the quantity of gas flowing.

The drop in pressure will be as the square of the gas flowing. As an example: Say you had flowing 20 feet of gas per hour, and the drop in pressure was 2-10 inch; then to find the drop in pressure for any other quantity of gas you would multiply 20×20, and the ratio of this product to the square of any other rate of flow would represent the ratio between the two drops in pressure. We have, for instance, in one case $20 \times 20 = 400$, which we have found corresponds to a drop of 2-10 inch; now, should we want to determine the drop with 40 feet of gas flowing we would multiply $40 \times 40 = 1600$. As 1600 is four times as much as 400, the drop in pressure would necesarily be four times as great, or 8-10 inch.

Serious fluctuations in pressure will be apt to alter the time required for any appliance to do a given amount of work. It may even reduce the flow of gas to a point where the appliance will not do the work for which it was intended. Generally speaking, the best results in fuel gas appliances for cooking or heating, using a Bunsen burner, are obtained with the maximum pressure of gas, provided the supply is not checked by any valve or stopcock, but is checked entirely by the size of the gas orifice in the burner. This is due to the fact that the Bunsen burner operates on the principle of induction, and the inductive effect is greatest when the velocity of the gas issuing from the orifice is greatest. If all of the pressure contained in the gas is distributed in the Bunsen burner it tends to produce a more intimate mixture of gas and air, and the more intimate this mixture becomes the more intense will be the combustion and the higher the flame temperature.

Fiske & Co., Natick, Mass., inform us that they have been busily engaged in heating and plumbing the barn of J. B. March, at Wells Hills, and plumbing the new Congregational Church at Wellesley Hills. They have also done the heating and plumbing in new houses for Miss Morgan and A. R. Clapp. The firm are remodelling the plumbing in the house of N. Swift and putting a new Richmond Boiler in the French Church at Cochituate.

THE EFFECT OF AIR IN WATER SERVICE PIPES.

BY P. P.

There are many men working at the plumbing trade who have never studied natural philosophy or much of anything else, and it is not strange that they will arrange piping so that it will become air bound. To men of this class such an invisible and unsubstantial material as air, which can be pushed aside with a fan, is not taken into consideration in the arrangement of their work. Two instances have recently been brought to my attention where water would not flow, to the utter astonishment of the men who did the work of arranging the piping. One of these pieces of work was done by a man in

The Effect of Air in Water Service Pipes.—Fig. 1.—Water Stopped Flowing at Right Hand Basin.

the progressive and highly enlightened city of New York, and on the island which is New York itself, not in the suburbs that have been added as satellites. In one of the high tenement houses there was a wash basin at the top floor which was supplied with water from a tank on the roof; consequently there was very little pressure. A wash basin was desired in an adjoining room, and as it would have made considerable trouble to run the pipe across under the floor to the desired fixture, a supply pipe for it was carried up to the ceiling, then over to the lavatory, as shown in Fig. 1, and dropped down and connected with the basin cock, as indicated. To my mind it was the most natural thing in the world for air

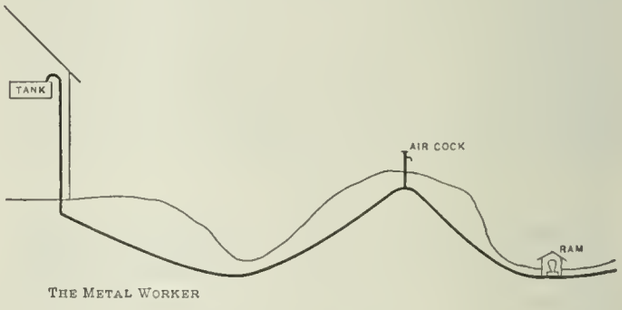


Fig. 2.—Air Lock in Ram Pipe.

to collect in the horizontal pipe running along the ceiling, and it finally did. There being such a small pressure exerted to overcome the air lock at that point, owing to the small distance of the tank above the pipe, it was not long before it was impossible to draw water at the new wash basin. This lavatory was rendered useless until it was suggested that an air valve be placed in the horizontal pipe to allow the air to escape; after that no further trouble was found with the lavatory.

The other trouble from air was in the pipe from a hydraulic ram to the tank in a country house. Between the house and the ram there was a space of low ground, and between this low place and the ram was a low hill. It was found that after the ram had operated for about 24 hours it was impossible to drive any more water through the service pipe to the tank. Immediately inquiry was made from men who might know the cause to find out what stopped the flow of water. In order to prevent freezing the pipe from the ram followed the line of the surface of the ground, but about 3 feet below it. This formed an air trap at the little hill. On the advice

of a man who had considerable experience with ram work a small hydrant was located on top of the hill, as shown in Fig. 2. so that when air accumulated it could be allowed to escape. This overcame the difficulty.

The amount of pressure that is required to dislodge air or to force water past air trapped in a pipe increases very fast in proportion to the depth of the air lock. If a service pipe is in the ground, or suspended from joists, so as to sag and form several air locks, little pressure will be required to force water to pass the first lock. About twice as much will be needed to make it pass the second, and the pressure that will be required to pass the other air locks will continually increase and be very much in excess of this. All who run water service piping should be instructed by their employers, or the foreman under whom they work, of the effect of an air lock in a service pipe, and should be instructed to arrange their piping so that it will never have any traps in it.

Modern Factory Heating Systems.

A good example of the heating methods employed in a modern shop may be observed at the new repair shops of the Rhode Island Suburban Railway Company on Cranston street, Providence, R. I., says the *Journal* of that city. These shops cover about 3 acres of ground and are heated by what is known as the indirect hot blast system. Near the rear of the building is located a vertical tubular boiler, and the steam is conveyed through asbestos covered piping to a heating chamber on the second floor in the center of the shops. In this chamber the steam passes through a series of cast iron radiators of large heating surface. The cold air is drawn over these radiators by two large exhaust fans and warmed. After passing through the fans the air is forced through galvanized iron piping to the various divisions of the shops. The piping varies in diameter from 5 feet near the central heating chamber to 6 inches at the various outlets, which are mostly located on the inside of the outer walls of the building about 7 feet above the floor level. At each outlet is a hand damper to control the admission of hot air into the shops. There are several of these outlets, averaging about 12 feet apart, so that the warm air may be distributed very freely through the rooms, and the large number of outlets does away with cold spots.

The fan apparatus is in duplicate, so that either one or both fans may be run, depending on the atmospheric temperature, or either fan may supply the entire system. The fans are operated by two specially constructed motors so that they may run at two different speeds, thus making at least four variations in the amount of hot air that may be supplied.

The galvanized ducts are in and under the roof trusses of the building, entirely out of the way of the shop work, and are so gauged in size that the velocity of the delivery of the air at any outlet is substantially the same. The condensed steam or return drip goes back to the boiler automatically.

In some of the ducts there are baffle plates, or deflectors, which make it possible to keep some at a higher temperature than others.

During the recent cold snap, which is the first real trial the system has had, the heating plant kept the shops at a suitable temperature. It is believed that this system is superior to the system which diffuses the air to the various rooms through a few very large openings.

The entire system is installed in a first-class manner, and these 3 acres of building, averaging about 25 feet in hight, are heated at the present time at an expenditure of about 2 tons of coal per day.

This system was designed and erected by Westinghouse, Church, Kerr & Co. of New York, under the direction of the engineering department of the Rhode Island Suburban Railway Company.

A. Morris Collins, for many years a buyer for the E. W. Blatchford & Co., Chicago, died at his home on January 26 as the result of an attack of appendicitis.

ASSOCIATION NEWS.

Canadian Master Plumbers.

The second annual banquet of the Master Plumbers' Association of Hamilton, Ont., was held in the Waldorf Hotel January 29. Andrew Rogers presided and W. G. Smith was in the vice-chair. About 35 persons were present. Among those who responded to toasts were: J. Hillwell, J. H. Harr, J. Patterson, R. Somerville, R. Armstrong, J. Mann, H. Ross, H. W. Anthises, Toronto; O. G. Carscallen, Hugh S. Wallace, Ald. W. Findlay, Hamilton.

Manhattan Delegates.

At a meeting of the Manhattan Branch of Master Plumbers' Association of New York City, held on February 4, the following delegates were elected to attend the annual convention of the New York State Association of Master Plumbers, to be held at Elmira in March: A. H. Brown, B. F. Donohue, Philip Brady, T. A. Hill, A. W. Reynolds, T. J. McCormack, Wm. Kirchoff, T. J. Tuomey, E. J. Brady, T. J. Cummins, M. J. O'Brien, Alex. Bryant, S. L. Malcolm, John Renehan, I. O. Shumway, Thos. F. Gaynor, I. J. Brown, W. J. McDermott, J. A. Rossman, J. T. Coyle, John Boyd, Frank Reynolds, I. J. Barth, J. W. Cooney, T. S. Cochrane, Jr.; T. F. McCaul, M. F. Donahue, C. A. Walsh, H. G. Gabay, Chas. Tucker, J. F. Kelly, A. E. Jackson, Sam. Klein, John Mitchell, Geo. McQuillan, J. W. O'Brien, E. J. Renehan, J. D. McEntee, L. H. Stroh, John Yule, Paul Euell, H. E. J. Schiffer, Milton Schnaier, Thos. Martin, Jos. Corkery, P. J. Andrews.

A Buffalo Plumbers' Dinner.

A delightful banquet was given by W. A. Case & Son of Buffalo, N. Y., to the Master Plumbers' Club on the evening of January 30, covers being laid for 70. Mr. Case was absent because of illness, but he was represented by his partner, Mr. Fell, who acted as toastmaster. The toasts were as follows: President Steuart of the local association, "Master Plumbers;" Mr. Huck, president of the State Association, "The State Association;" Arthur E. Stevenson, "Fire Hydrants;" Charles Geiger, "The Future President of the State Association;" Samuel Bart, "City Hall;" John Kavany, "The Directors of Buffalo;" John J. Stygall, Jr., "Executive Committee;" Fred. J. Vaux sang and Donald Lund and Joseph Ayex told stories. There was a recitation by Mr. Mitchell.

Banquet in the Plumbing Trade.

The Manhattan Branch of the Master Plumbers' Association of New York City have arranged to give a testimonial banquet to the Honorable Percz M. Stewart, Superintendent of Buildings, at Shanley's, Broadway and Forty-third street, on Wednesday evening, February 19, and the following committee has been appointed to take charge of the affair; A. W. Reynolds, chairman; T. F. Gaynor, treasurer; Alexander Bryant, William Bryan, T. J. Tuomey, I. J. Brown and W. J. McDermott. This banquet is tendered in a friendly spirit, in view of the favorable action which the Superintendent has taken in considering several important matters which have emanated from the association, and it was ordered by a special resolution of the association. The committee have been ordered to provide an affair suitable to the occasion, and commensurate with the dignity and reputation of the association. The committee having the affair in charge have issued invitations to the members, expressing a hope that they will find it convenient to be present and thus add to the general felicity of the occasion. They request that those who intend participating will express their determination at an early date, in order that proper provision may be made.

L. E. Ballou has sold out his plumbing business in Beechertown, Mass., and will open up a shop in Barre.

The P. and S. S. League.

The closing games of the Plumbing and Steam Supply League bowling tournament are being contested. On Monday night the good fortune which has attended the John Simmons Company team found but three men on the team of the salesmen, their sharpest competitors, and they had practically a walkover for their first game, while the team of the Central Foundry Company made a very poor showing for the second game. The Diamond S. team has now completed its schedule, having won 12 and lost two games, and cannot be beaten for the first place, although they may be tied by the teams of Behrer & Co. and the Crane Company. The feature of the Thursday night bowling was the winning of another game by the E. F. Keating team, so that they force the Thomas G. Knight team to share the honors of being tailenders with them, and they may have still more company. They also beat their previous high score and placed it at 675, when they beat the Central Foundry Company team. But they were subsequently beaten by the Dimoch & Fink Company team, which afterward lost to the Central Foundry Company, making honors even for the evening.

It is probable that the tournament will close with a dinner, when some of the most prominent men in the trade will respond to the call of the toastmaster and present the prizes to the winners. This movement to bring the trade together in social entertainment has been very popular. Those interested in the league have encouraged the formation of the Business Men's Championship Tournament, in which teams from the following leagues will be represented: Bank Clerks', Life Insurance, Fire Insurance, Drug Clerks, Commercial and Plumbing and Steam Supply. R. C. Wilson has been elected president, M. C. Hoyt, secretary, and H. Cadien, treasurer. This tournament will open March 3 and close May 4. The teams will consist of ten men, five to roll in the first game, five in the second and a selected five in the third game on the same evening. H. Cadien has presented a $60 trophy, which must be won twice in succession to become the property of any team. In addition, there will be three team and two individual prizes. The match with the bowlers in the Boston supply trade has not yet been arranged.

New York City Notes.

Trade is reported as very quiet in all the boroughs, ordinary winter jobbing and repairs being particularly dull. What new work and overhauling is in hand is principally that which has been going on for some time.

* * *

L. D. Hosford will have a nice job of plumbing to do in the First Scientist Church, at the corner of Central Park West and Ninety-sixth street. Chas. Hensle is getting well on with the block he is doing for John V. Signall, between Ninetieth and Ninety-first streets.

* * *

The city plumbers have been changed. Since February 1 Wm. Montgomery has the City Hall Park buildings, in the place of J. F. Sweeney. Wm. H. Montgomery has the ontside buildings, except the armories, in the place of Jno. W. O'Brien. Ambrose Neal has the steam fitting.

Charles F. Hauss, who has spent the past two years in Europe introducing American heating apparatus to the foreign steam and hot water fitters, has connected himself with the American Radiator Company of Chicago. Mr. Hauss will make his headquarters at Antwerp, Belgium. He sailed for that city on the Red Star Line steamer "Kensington" on Thursday, and will devote himself this year to advancing abroad the interests of the extensive line of Radiators and Steam and Hot Water Heaters made by the American Radiator Company. The success that has attended Mr. Hauss' previous trips abroad should be surpassed with the more extensive line that he now has to offer the heating trade, with the assistance of the company's branch in London and their other foreign connections.

Heating and Plumbing Notes.

A bill has been introduced into the New York Legislature to amend the plumbing laws by the addition of the following paragraph: "A person duly licensed as an employer or master plumber in any city of the State may follow and conduct such trade, business or calling in any other city of the State, except the city of New York, upon filing certified copy of his license in the office of the Board of Health in the city in which he desires to carry on and conduct such trade, business or calling."

J. A. Smith of Akron, Ohio, has brought suit against all plumbers in that city who belong to the Master Plumbers' Association, on the ground that they constitute a trust. The suit is for heavy damages.

Capt. Henry Goss, for many years prominent as a plumber and a citizen of Kansas City, Mo., died at the home of his daughter, Mrs. Howard McCutcheon, in Kansas City, on January 26. Captain Goss served the country in the Civil War, where he secured his military title. In 1874 he settled in Kansas City and entered the plumbing and heating business. He was well known to association plumbers throughout the United States. Captain Goss is survived by two daughters.

E. H. Good, clerk of the Board of Education of Tiffin, Ohio, will receive bids until February 21 for the new heating system for the Columbian High School. Bids for heating the building with hot water and steam will be considered.

Harry L. Hemenway, for many years a member of the plumbing firm of the F. O. Ray Company, Nashua, N. H., has withdrawn from the company and accepted a position in Milford.

A fire recently occurred at the plumbing establishment of J. W. Hill, Lancaster, Ohio, doing damage to the extent of more than $1000, which was partially covered by insurance.

Rourke Brothers of New Haven, Conn., have moved into new quarters in the Kelly Building, at 834 and 836 Grand avenue. This building is 50 x 100 feet and it is lighted on three sides. The front is occupied by general and private offices, and the shop space is divided so that one-half is devoted to cornice and sheet metal work and the other half to plumbing and heating. The shops are equipped with modern machinery operated by electricity. In addition to the shop and offices, the firm have the entire basement of the building, giving them ample facilities for carrying a stock of Pipe and Steam Fitting and Plumbing Goods. They are displaying a line of Model Boilers and a variety of designs for Metal Ceilings and Side Walls, a branch of business to which they are giving special attention. They are now engaged in plumbing and steam heating the new Young Men's Christian Association Building, and are plumbing the new Greist residence, in New Haven. They are also doing the plumbing and sheet metal work on a new warehouse for Dillon & Douglass, as well as the sheet metal work on the new City Mission building.

The Adams & Jones Company of Boston, Mass., issue, under date of February 1, an announcement that Irving G. Dimond has associated himself with that house, and will represent them in the States of Maine, New Hampshire and Vermont, with headquarters at Portland. In addition to the Ideal Boilers, the company will have to offer to the trade this year a complete line of Radiators and a full line of Steam and Hot Water Specialties.

Harry Park has sold out his plumbing business, at 509 North Main street, Findlay, Ohio.

The John T. Bealor Mfg. Company, formerly of Erie and West Diamond streets, Allegheny, Pa., are sending out a notice of the removal of their plant to the four-story building, 1300-1342 River avenue, formerly occupied by the Standard Mfg. Company, where they will have more room and better facilities to carry on

their business of steam, hot water and hot air furnace heating, and making sheet metal work, cornices, skylights and ventilators. The notice states that the company have a complete drafting and estimating department, and would be pleased to place it at the disposal of architects, builders and owners. They make a specialty of the Superior Warm Air Furnaces and the Heating Apparatus made by the Utica Heating Company.

Thomas Roberts, 15-17 Main street, Toms River, N. J., informs us that he has the contract to drive three 3-inch wells for the water company at Island Heights, N. J., and to tap the mains and run the pipes to the service boxes at the curb.

The Examining Board of Plumbers of Albany, N. Y., organized on January 27 by the election of Robert I. Wilson as president and City Clerk A. J. Hoogkamp as clerk. The rules and regulations governing the proceedings of the board, and the rules and regulations for the examination of persons applying for a certificate of competency, and the rules and regulations governing plumbing and drainage, now in force, were declared to be the rules of the present board.

W. H. Morrison, Torrington, Conn., has the contract for plumbing two blocks of buildings that are being erected in that town by Hotchkiss Brothers.

The main building of the Seestedt Brothers Mfg. Company of Romulus, Mich., manufacturers of Bathtubs, Closet Seats, &c., was destroyed by fire on January 29.

The contract for a plumbing, gas fitting and hot water system and a ventilating system for the new County House at Butte, Mont., has been awarded to J. Kreuger at his bid of $4922.

Simpson Clark, Springfield, Mass., is installing Hot Air Furnaces in the residences of Mrs. Jovey, Charles Clark, C. N. Dean and William Patton in that city. He is putting Steam Boilers in the residences of George Austin and W. A. Hatch and is also busy with some plumbing contracts.

Miles D. Lindley, president of the Board of Education of Hamilton, Ohio, will receive bids until February 21 for heating and ventilating a new school building in that city.

The master plumbers of Memphis, Tenn., have promulgated a new set of shop rules, which has led to a strike in that city. It is claimed that the new rules in many instances are a direct contravention of the rules of the local unions.

For the purpose of learning the views of the steam and hot water fitters of New Jersey on the subject of a local association, a meeting was held last week, when it was decided to issue a call for a meeting in Newark this week. At the time we go to press this meeting is being held for the purpose of forming a local association, to be affiliated with the National Association of Master Steam and Hot Water Fitters, and for the election of officers. T. B. Cryer of T. B. Cryer & Co., Newark, N. J., is prominently connected with the movement.

S. E. Dibble, New Haven, Conn., is remodeling the plumbing in the residence of Frederick Ives. The contract includes new bathrooms, lavatories, water closets and hot and cold water service. A gasoline pump and engine will also be installed to insure a positive water supply.

Joseph J. Spencer of the firm of Spencer & Parks, manufacturers of Gas and Electric Light Fixtures, died suddenly on February 3 from cerebral hemorrhage, at his place of business, 194 Park avenue, New York.

Wept Brothers, Findlay, Ohio, manufacturers and wholesalers of Plumbers' Water, Gas and Oil Well Supplies, have purchased the property formerly occupied by McManus & Seymour, manufacturers of rakes, which they will convert into a machine shop. The firm will enlarge the plant by the erection of a store room and offices and in connection with the machine department will carry a complete line of Mill, Engineers' and Plumbers' Supplies.

The stockholders of the Pittsburgh Valve, Foundry & Construction Company at their annual meeting January 27 re-elected the old Board of Directors, consisting of President Henry M. Atwood; J. T. Speer, vice-president; Moses Atwood, secretary; Charles A. Anderson, treasurer, and R. J. Wilson. No financial statement was made public, but it was stated that the company had done splendidly during the year. No new improvements are contemplated, as the company completed their new foundry and machine shop on Twenty-sixth street some time ago. The offices will be moved to the works.

The Stover Mfg. Company, Freeport, Ill., held their annual meeting on January 27 and elected the following list of officers: D. C. Stover, president; A. S. Held, vice-president; W. A. Merrifield, general manager, secretary and treasurer; O. J. Ziegler, general superintendent; W. A. Hance, superintendent of machinery; J. M. Irwin, superintendent of agencies. The year 1902 opens auspiciously for the company, the demand being greater than ever for their line of Windmills, Grinding Mills, &c. The new factory which has been building during the past year is now ready to occupy, and the transfer of the stock and machinery will be made the first week in February. When settled in the new quarters the company will have the best possible facilities for the manufacture of Windmills and Grinding Mills, and at least three times greater capacity than in the past.

The Kellogg-Mackay-Cameron Company, wholesale dealers in Heating Supplies, covering the entire Western country, have closed arrangements for the Clow Building at Lake and Franklin streets, Chicago, and will occupy it about March 1. The firm's business has outgrown the present quarters at 110 Lake street, and they will utilize the ample space in the seven-story building above mentioned, where everything required in the steam and water heating business will be carried in stock, including Boilers, Radiators, Pipe, Fittings, Brass Goods, &c.

The McKenna Brothers Brass Company, Limited, of Pittsburgh, manufacturers of Brass Goods and Saloon Supplies, have decided to give 10 per cent. of the net profits of the concern to employees remaining on the pay roll at the end of the year. The division is to be made on the basis of wages earned by each. If the plan proves successful it will be continued. The men affected are, as a rule, skilled workmen and their salaries range from $18 to $25 per week. The net profits to be divided among the men will come from the manufacturing part of the plant. The McKenna Brothers Brass Company, Limited, are now occupying their new building, First avenue and Ross street, Pittsburgh, which gives the concern very much larger facilities for carrying on their business.

The new plant of the Charlotte Pipe & Foundry Company, Charlotte, N. C., went into operation last week. It is a complete modern foundry plant. The main building is 100 x 150 feet in size, and equipped to produce 2, 4 and 6 inch pipe in 5-foot sections, using pig iron from the Birmingham district. The incorporators of the company are W. F. Dowd, S. F. King, Z. V. Kendrick, J. P. Beggs and J. J. Beggs. The last two named are experienced manufacturers, formerly located at Birmingham, Ala.

The Robert Leinau Heating Company of Philadelphia have secured the contract for the steam heating plant for the next Camp Curtin Building, at Harrisburg, Pa.

United States Consul-General Guenther of Frankfort, Germany, says that the Central Museum established by the Society for the Improvement of Workmen's Dwellings in that city desire catalogues and price-lists and samples, if possible, of American building material, including Sheet Iron Work, Plumbers' Supplies, Sashes, Doors, &c. Communications should be addressed to Dr. Phil. Stein, 1 Boersenstrasse, Frankfort, secretary of the society.

New Firms and Changes.

J. M. & H. Hamaker have opened a shop at Middletown, Pa., to do a plumbing and general sheet metal business.

The plumbing firm of Reed & Conant, Gardiner, Maine, have been dissolved.

The Hartford Blower Company, 65 Suffield street, Hartford, Conn., are a new concern recently organized

with a capital of $50,000. The officers are Elizur Keeney, president, and C. H. Keeney, treasurer and general manager. They will manufacture Steam, Electric and Pulley Fans, Exhaust Systems and Mechanical Draft Apparatus. The company are the sole manufacturers of the Hartford Patent Adjustable, Interchangeable and Reversible Blowers and Exhausters. They will make a specialty of all the apparatus required for forced and exhaust draft, steam heating, ventilating and drying apparatus, dust separators, blast gates, galvanized sheet iron piping and heavy sheet iron work. The company are prepared to install complete systems for exhausting the refuse from wood working factories, sawing and planing mills, foundries, polishing and buffing rooms, pulp and paper and textile mills, sugar and dye houses, shoe factories and fertilizer works. They are about to issue a new catalogue which will be of interest to those who require such apparatus or systems.

Miles Kehoe has qualified as a master plumber by passing the examination of the city of Oswego, N. Y., and will open up for business at 164 West First street.

The Peter Schaefer Plumbing Company of St. Louis, Mo., have been incorporated with a paid in capital of $5000, of which Henry E. Calvert has 27 shares, Peter Schaefer 20 shares, Floyd B. Calvert 2 shares and Joseph Fox 1 share.

The Stephen Lane Company have been incorporated with a capital of $10,000 at Atlantic City, N. J., to engage in the plumbing business.

The Rundle Mfg. Company have succeeded the Sanitary Enameling Company of Milwaukee, Wis. At a meeting of the Board of Directors on January 22 R. G. Hayssen was elected president; A. H. Hayssen, vice-president, and Charles L. Rundle, secretary and treasurer. The firm will make Enameled Bathtubs and a full line of Sinks, Lavatories and Water Closets.

The Kirby-Williams Company of 216 South Main street, Pittsburgh, Pa., have been organized to deal in Merchant Pipe, and to do a pipe cutting, threading and bending business, also to sell second-hand machinery. The company are at present in the market for pipe cutting and threading machinery.

The Ellison Brown Electric Heater Company of Philadelphia have been incorporated with a capital stock of $250,000, to construct apparatus for the generation and development of heat by electricity.

The Duty on Nickel Plated Tin Plates.

Washington, D. C., February 4, 1902.—The Treasury Department has promulgated an interesting decision with regard to the dutiable classification of tin plates plated with nickel on one side, in which is discussed the entire question of the proper classification of plates treated in any other manner than by the ordinary process of tinning. The facts in the case upon which the ruling is made, together with the Department's decision, are set forth in the following communication from Acting Secretary Spaulding to the Collector of Customs at New York:

The merchandise in question consists of tin plates 21 inches wide, 30 inches long and 0.023 inch thick, plated with nickel on one side and commercially designated as "nickel plated tin plates."

In Treasury decision 6844, dated April 7, 1885, the Department decided that certain "lacquered tin plates" consisting of the ordinary tin plates of commerce, coated with a thin varnish or lacquer to imitate brass, used in the manufacture of tin cans, boxes, signs, &c., were dutiable as "tin plates" under paragraph 153 of the tariff act of 1883, of which paragraph 134 of the existing tariff act is a substantial re-enactment. And in the unpublished decision of the Board of United States General Appraisers, dated October 29, 1900, in the matter of the protest of the American Trading Company, it was held that certain "gold lacquered crystallized tin plates," were classifiable under the provision for tin plates in paragraph 134, and not under paragraph 193 of the tariff act of July 24, 1897. The Board remarked, citing Treasury decision 6844, supra, that——

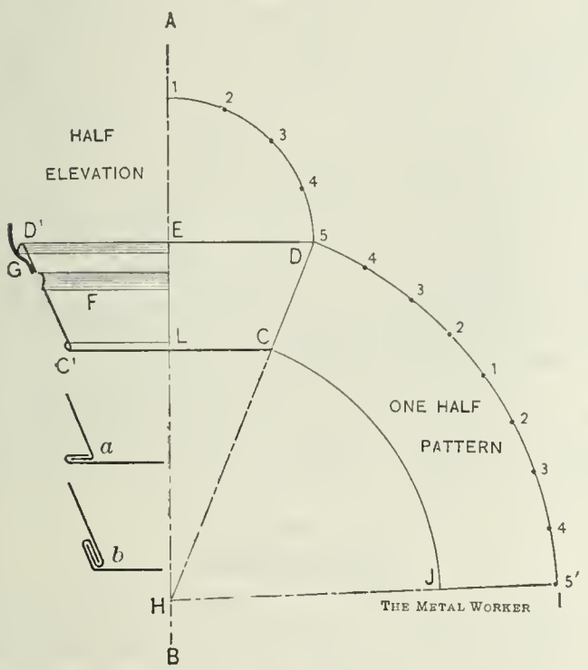
"The fact that these tin plates have been covered with a coating of lacquer does not alter their classification, for they still remain tin plates, but their designation as lacquered tin plates is solely to distinguish them from the plain and ordinary tin plates."

Paragraph 134 provides for sheets or plates of iron or steel, commercially known as tin plates, "coated with tin or lead, or with a mixture of which these metals, or either of them, is a component part." . . . It therefore might be objected that tin plates, coated or plated with nickel, are not specifically provided for in that paragraph, but the article in question would nevertheless fall within its terms by virtue of the similitude clause in section 7 of said act.

In view of the foregoing and as tin plates are expressly excepted from the provisions of paragraph 132, imposing an additional duty of two-tenths of 1 cent per pound on iron or steel sheets or plates "when galvanized or coated with zinc, spelter, or other metals, or any alloy of those metals," . . . the Department concurs with the views expressed by you that the merchandise here under consideration is dutiable at 1½ cents per pound, under said paragraph 134 of the existing tariff act. It should be added that the assessment of a lower rate of duty on articles not specially provided for in the present law, manufactured wholly or partly from tin plate other than that imposed on the tin plate of which they are made, is prohibited by the terms of paragraph 140 of said act.

THE SHEET MEETING AT PITTSBURGH.

Pursuant to a call issued by A. F. Baumgarten of the Maryland Sheet Steel Company, at Cumberland, Md., about 15 independent sheet manufacturers met in the Hotel Lincoln, Pittsburgh, on Monday, February 3. The purpose of the meeting, as stated in the letter sent out to the trade by Mr. Baumgarten, was for the purpose of affording opportunity for the independent sheet manufacturers to become better acquainted, to take up the matter of prices of sheets, and also the question of supply of sheet bars and prices of same. W. L. Glessner of the Laughlin Nail Company, operating a sheet mill at Martin's Ferry, Ohio, was chairman of the meeting. A full discussion of existing conditions in the sheet trade was had by those present, but no action of importance was taken. At present the demand for sheets regulates prices, which are quite profitable to the manufacturers in spite of the high prices of sheet bars. The question of a number of the leading independent sheet mills going together to build an open hearth steel plant to roll sheet bars was discussed informally, but no definite action was taken. Some of the sheet mills are pretty well covered on sheet bars for this year and do not see the necessity now of building a steel plant. A. F. Baumgartner was appointed corresponding secretary for the purpose of addressing another letter to the independent sheet manufacturers, with a view of having a fuller meeting, to be held in Pittsburgh in the latter part of this month.



The N. & G. Taylor Company

The N. & G. Taylor Company announce the removal of their general offices from the Branch street building, which they have occupied since 1845, to the Mariner and Merchant Building, Chestnut and Third streets, Philadelphia, where they have had spacious offices handsomely fitted up for their use. This change was rendered necessary by their rapidly growing business in the line of tin plates and iron and steel sheets, and also their trade in open hearth soft steel sheets for stamping purposes, which are made at their works at Cumberland, Md. The company's minor offices have been transferred to their tin plate works at Tasker and Swanson streets, Philadelphia, where the company have also erected large warehouses for the storage of goods. The company's tin plate department has also been enlarged, and a new smelting works erected to meet the increased demand for their solder, babbitt metal, &c.

PATTERN FOR ROUND DISH PAN WITHOUT ALLOWANCE FOR LAPS.

In the accompanying illustration is shown the method of obtaining the pattern for a round dish pan, which can be made in two or more pieces of I C or I X tin with grooved seams. First draw any line, as A B, upon which place the hight of the pan, as E L. From E and L at right angles to A B draw the lines E D and L C to their required dimensions, and draw the line D C, which extend as shown, until it meets the center line at H. Then with H as center and radii equal to H C and H D, draw the arcs C J and D I respectively. Now, with E as center and E D as radius describe the quarter circle D 1, which divide into equal spaces, as shown by the small figures 1 to 5. Set the dividers equal to one of these spaces, and starting at D step off twice the amount of spaces contained in the quarter circle E 1 5, as shown by the small figures 5 to 1 to 5′ on the arc D I. From 5′ draw line to the center H, intersecting the inner curve J C at J. Then will C D J I be the one-half pattern for the dish pan.

The bottom to the pan is double seamed. The first operation is shown by *a*, the second and final operation

Round Dish Pan.

by *b*. D¹ E L C¹ shows a half elevation of the finished pan. Using the small beader, a bead is placed as at F. Tinned iron handles are riveted in position, as at G, and a wired edge is made at the top.

Australian Tin and Tin Mining.

BY JOHN PLUMMER, SYDNEY, AUSTRALIA.

The deposits are scattered widely throughout Australia, there being over 120 recognized stanniferous localities in New South Wales alone; but comparatively few are worked to any considerable extent, limited water supply and absence of cheap and speedy means of communication with the coast forming at present—apart from fluctuations in market prices—the leading difficulties encountered. Although in the parent State the existence of tin was discovered as far back as 1851, it was not until over 20 years later that mining operations were commenced. In 1872, according to Professor David of Sydney University, tin stone was accidentally discovered while searching for gem stones near Inverell, in the northern part of the State. Mixed with a number of sapphires and other gems in the gravels of the creeks was a heavy black mineral, in water worn grains, which, on assay, proved to be oxide of tin. The discovery becoming known, a Sydney company took up some ground in the vicinity, and then commenced a rush to what are now known as the New England tin fields.

Strangely enough, the stream tin, as the black material is called, had long been familiar, under the name of "black sand," to alluvial gold miners in the district, where its weight, rendering it difficult of removal from the sluice boxes, had caused it to be regarded as worse than a nuisance. In some places the stockmen, ignorant of the real character of the sand, used it for cleaning their bits. Native tin has been found in the State, but, as in other parts of the world, it is of rare occurrence. The same may be said of stannite, or tin pyrites, although it is plentiful, with galena, zinc blende and arsenical pyrites, in the Borah Creek Silver Lode, near Inverell.

The common ore of tin is the oxide, otherwise known as cassiterite or tin stone, found in New South Wales in several forms, and of various colors. At Vegetable Creek, the leading tin field in the State, between 1872 and 1885, 15,000 tons of cassiterite are said to have been extracted from a shallow alluvial deposit, within a distance of a little over 5 miles from its source downward. The total area of ground worked was about 150 acres, which produced 15,000 tons of stream tin, or at the average rate of 100 tons per acre, or half a hundredweight of cassiterite per cubic yard, allowing the mean depth of the wash dirt to be 2 feet 6 inches. The depth of stripping (overlying soil) varied from 6 inches to 9 feet. At Catarrh Creek about 1000 tons of stream tin were obtained from the shallow alluvials within a distance of about 1 mile. The width of the deposit varied from 200 to 450 feet, and the depth of sinking to the granite bed rock was from 10 to 14 feet. The Vegetable Creek workings are situated in what, during early Tertiary times, formed the main drainage channel of this part of the State. In portions of its course there were two distinct flows of lava, an older and a newer, each covering a bed of stanniferous wash dirt. Up to 1886 the produce of these latter was 6000 tons of stream tin in a distance of 2 1-3 miles. At one place an area of 5½ acres of gravel, having an average thickness of 3 feet, yielded 2000 tons of tin ore.

In the far western portion of the State, at Euriowie and Poolamacca, about 50 miles to the north of Broken Hill, tin ore occurs under conditions differing materially from those of the other New South Wales tin fields, the ore bearing a marked resemblance to that from the Harney Peak mines of South Dakota, in the United States, and to such an extent that specimens from the two places cannot be readily distinguished from each other. A considerable area of ground was pegged out for mining purposes when these deposits were first discovered, but probably not more than 100 tons of dressed ore were dispatched from the field before it was abandoned. The scarcity of water for the necessary concentration processes, and the distance (several hundred miles) which separates the district, which is rich in minerals, from the seaboard, are the chief reasons which led to the cessation of mining operations, which are certain to be resumed when conditions are more favorable.

It is, however, as pointed out by E. F. Pittman, in his work on "The Mineral Resources of New South Wales," in the northern portion of the State that the principal stanniferous deposits occur. From near Tamworth tin bearing rocks extend northward, with some intermission, up to the Queensland border. The mean width of this area is about 30 miles, and within it are the leading New South Wales tin fields. The largest export of tin raised in the State was 9125 tons, value £824,552, in 1883; and the greatest value £833,461 (for 8670 tons), in the previous year. The quantity exported in 1900 was 916 tons 7 cwt., value £120,932, making the total quantity exported since the opening of the New South Wales tin fields, in 1872, 135,078 tons, value £10,849,238. This does not include the produce of other States.

STEELE, ANDRE & Co. are a new firm, at 113 South Main street, West Hartford, Conn., recently organized for conducting a tin, copper and sheet iron business, together with furnace heating. The new firm are composed of Wilbur S. Steele and L. R. Andre, who are both well known to the trades, having been for many years connected with George M. Couch. They have secured the agency for the well-known Thatcher Furnaces.

Parkersburg Iron & Steel Company.

Permanent organization of the Parkersburg Iron & Steel Company, incorporated some time since for the manufacture of sheets, was effected last week at Parkersburg, W. Va., when the following officers were elected: President, H. H. Nieman, formerly president of the Canonsburg Iron & Steel Company of Canonsburg, Pa.; vice-president, H. S. Duncan, formerly a member of the Canonsburg Iron & Steel Company; secretary and general manager, J. F. Budke, a State Senator of Pennsylvania and former manager of the Canonsburg Iron & Steel Company; treasurer, L. A. Meyran, formerly secretary and treasurer of the Canonsburg Company, and assistant secretary, A. H. Geilfuss, formerly assistant secretary of the company named. The following, in addition to the above named officers, were elected on the Board of Directors: A. E. Succop, A. E. Nieman, F. W. Budke, W. R. Geilfuss, George W. Flowers, Charles H. Geilfuss and W. H. Paxton.

The company's plant, which is already in partial operation, is located at Parkersburg, W. Va. Four mills were recently started and two additional mills are now being erected. The combined capacity of the six mills will be 70 tons of sheets daily. The company's plant embraces a main mill building, 120 x 486 feet. This building contains sufficient space for the installation of six additional mills, which it is proposed to add to the plant during the present year. An additional building, 110 x 225 feet, will be erected adjoining the mill building for a skelp and bar mill, and a forge department to make hammered iron blooms for the production of sheet iron will also be installed, together with a tin dipping plant. The entire plant is expected to be in operation within two months. At present the office of the company is located at the Times Building in Pittsburgh. As reported recently in these columns, the company have bought the stamping plant of the Budke Mfg. Company of Canonsburg, Pa., and will remove the same to Parkersburg, placing it on a site adjoining their rolling mills. A number of additions and improvements will be made to the stamping plant, including an equipment of the most modern improved machinery.

To Increase Production of Heavy Sheets.

The general superintendents of the American Sheet Steel Company are making a tour of inspection of the various mills of the concern. It is reported that the company will this year invest about $1,000,000 in the extension of their plants, and the present inspection by the superintendents is said to have a connection with these plans. According to a report from Pittsburgh, all the important plants of the American Sheet Steel Company are to be enlarged during the coming spring, more especially in the direction of equipment for rolling heavier gauge sheets. The capacity of the company's plants for the production of the lighter gauges of sheets is said to be amply sufficient for some time to come, but the demand for heavier sheets is increasing so rapidly that the company are obliged to take steps to provide enlarged facilities in this branch of their business. It is said that the great sheet plant at Vandergrift, Pa., will be added to during the present year, as well as the Apollo Works, and also some of the Indiana plants. The outlay of about $1,000.000 will be used mainly for machinery and equipment.

The Rolling Mill Company of America.

Work on the new ten-mill plant of the Rolling Mill Company of America, at South Connellsville, Pa., will be pushed to completion as rapidly as possible. Ground for the plant has already been broken and contracts have been let for the buildings and machinery. The plant will include four principal buildings, with a combined floor space of 66,500 square feet. The main building will be 108 x 410 feet; the finishing building, 50 x 300 feet; packing, shipping and warehouse building, 30 x 150 feet, and boiler house, 40 x 80 feet. All these buildings will be of steel and brick. All of the machinery, except the rolls, will be operated by electricity. The rolls will be driven by two 36 x 60 inch Hamilton-Corliss engines, each capable of developing 1600 horse-power. The fly wheels of the engines will be 30 feet in diameter, and will weigh 82 tons each. It is said that these will be about the largest fly wheels in use in this country. The plant throughout will be equipped with the most modern and improved machinery, and is designed to be a model establishment of its kind. George J. Humbert, who is well known as the head of the Humbert Tin Plate Company and the founder of the town of South Connellsville, is at the head of the new company. Mr. Humbert resigned the position of district manager of the American Tin Plate Company some time since.

Ornamental Sheet Metal Work.

We have received from L. H. Solosth & Sons, Grand Rapids, Mich., successors to the Ornamental Stamping Works of that city, a copy of their large catalogue of ornamental sheet metal work. It is composed of 110 pages, 10 x 12 inches in size, inclosed in a dark blue cover with gilt embellishment. The catalogue is bountifully illustrated by some 1300 line engravings and halftone cuts showing a very large variety of ornamental sheet metal work of all kinds used for architectural purposes. The first half of the catalogue is occupied by a variety of examples of artistic work in zinc and copper, embracing some very handsome and intricate designs suitable for all kinds of interior and exterior ornamentation. These are followed by examples of sheet metal statuary in zinc, bronze or copper. Finials, balusters, urns, steel siding, imitation pressed brick, weather vanes and metal letters and figures follow. The last pages of the work are devoted to a handsome line of steel ceilings, side walls, moldings, center pieces, coves and cornices, together with rosettes, and other architectural objects. Note is made that the company also manufacture a patent chimney cap and a line of copper and brass ware and nonrusting tinware. They also make machinery and dies for stamping purposes, and are prepared to do all kinds of metal spinning, stamping and pressed work. The office and factory of the company are located at 127 West Wealthy avenue, on the Lake Shore Railroad, Grand Rapids, Mich.

FLASHINGS.

President Shaffer of the Amalgamated Association is credited with the statement that at the annual convention of the association, to be held in Wheeling, W. Va., in April, a movement will be inaugurated looking to the abolition of the present mill committees, salaried district presidents being elected, whose duty it will be to settle all disputes within their districts.

The Provident Slate Company, Slatington, Pa., are sending out a circular letter to the trade, calling attention to their unfading Washington-Bangor and other grades of Roofing Slates. The company state that they are at present operating four quarries, each producing monthly 3000 squares of the best unfading Slate. The Washington-Bangor grade of Slate, they state, is mined from a depth of 325 feet, and its color is strictly unfading. Inclosed with the circular letter is a price-list, f.o.b. quarries, of the various grades of Roofing Slates which the company sell. The prices given apply only to shipments made prior to April 1, at which time another advance, they say, will probably take effect. The concern also carry a full line of Slaters' Tools.

The Dowman Mfg. Company of Atlanta, Ga., manufacturers of the Dixie Ventilator and of Galvanized Iron and Copper Cornices, Skylights and Finials, inform us that they have been awarded the contract for the sheet metal work on "Squash Court," which William C. Whitney is erecting at Aiken, S. C.

The Asphalt Ready Roofing Company, 136 Water street, New York, are sending to the roofing trade a calendar for 1902, the leading feature of which is a picture of a building showing the application of their Roofing Materials.

James Ackroyd, 10 and 12 James street, Albany, N.

Y., announces that he has associated with himself in business as contractors for roofing and architectural sheet metal work his sons, Hildreth J. Ackroyd and Austin W. Ackroyd, under the firm name of James Ackroyd & Sons.

We are indebted to the Slatington-Bangor Slate Syndicate, Slatington, Pa., of which James L. Foote is the general manager, for one of the large hanging calendars for the year 1902 that they are distributing among their customers and friends. The calendar sheets are 20 x 26 inches in size, and are bound in brass at the top, the monthly dates having figures of a size that can be readily seen at a considerable distance. In a little circular which accompanies the calendar the company apologize for the late date at which it is issued, remarking that there are, however, advantages is distributing a calendar to arrive alone on or after February 1 which do not attend the sending of it on January 1, when it would be merely considered with a number of others that arrive about the same date.

H. Clay Lynn, 409 Brook avenue, Richmond, Va., informs us that the outlook in the Cornice and Skylight department of his business is particularly bright. He has secured contracts for a number of buildings now in course of erection and to be erected, among which are the Bell Telephone Building in Richmond, three large stores at Hampton, Va., two stores at Newport News, Va., and a number of private residences in his locality.

George W. Jaques, who for upward of 35 years has been connected with the old established firm of A. A. Thomson & Co. of New York City, which went out of existence on January 1, has established himself at 234 Pearl street, New York, as a Tin Plate and Metal broker. Mr. Jaques' long connection with and experience in the Metal trade renders him peculiarly qualified for the line of business which he has taken up. He is very well and favorably known to the trade in the Eastern part of the country, and has the best wishes of many friends for success in the new line that he has adopted.

Samuel Cabot, 70 Kilby street, Boston, Mass., is the manufacturer of Cabot's Insulating and Deafening Quilt for use in buildings. It consists of a filling of cured eel grass, which will neither burn nor decay. The long, flat fibers cross each other at every angle and form a soft, resilient cushion of innumerable minute dead air spaces, the fiber being held in position by two sheets of paper closely stitched or quilted. The Quilt is designed particularly for the insulation of heat in connection with dwellings, cold storage pipes and ducts, poultry houses, under tin, &c., and in the absorption and dissipation of sound waves as a deafening agent especially for school houses, hotels, hospitals, society lodges, gymnasiums, residences, &c.

The Jackson Iron & Tin Plate Company, who are building a plant at Clarksburg, W. Va., advise us that their buildings are well under construction. About 90 per cent. of their machinery is on the ground, part of it being set, and they expect to be in operation in about 30 days. The officers of this concern are: T. M. Jackson, president; W. J. Grove, secretary and treasurer, and C. C. Moore, general manager.

George G. McMurtry, president of the American Sheet Steel Company, has been elected a director of the Rock Island Railroad.

A. Beard, manager of the Midland Works of the American Sheet Steel Company, Muncie, Ind., has been appointed division superintendent, the Piqua Works of same company, at Piqua, Ohio, having been placed under his charge.

John Stephens, superintendent of the Midland Works of the American Sheet Steel Company, Muncie, Ind., has resigned his position and will be connected with the Inland Steel Company, which concern will build Sheet mills at Indiana Harbor, Ind.

The Midland Works of the American Sheet Steel Company, at Muncie, Ind., have been much improved during the past six months, and other improvements are under way. A new tinning house is being erected and the plant is being equipped with special machinery for the manufacture of high grade Sheets. The plant is now operated almost entirely on specialties.

The Crescent Works of the American Tin Plate Company, at Cleveland, will undergo extensive improvements. A new annealing and cold rolling department will be added and the annealing furnaces now in use will be replaced by a single large furnace and the capacity of the finishing department will be largely increased. Work will be started on the improvements during the coming week, and while it is under way the annealing and cold rolling departments of the works will be idle.

The Wheeling Roofing & Cornice Company of Wheeling, W. Va., are erecting a new plant at New Martinsville, in that State, for the manufacture of Corrugated Sheets, Ceilings and Conductor Pipe, Eave Trough, Ridge Roll, &c., also a tinning plant of six sets and a galvanizing department. This plant will be operated by the company in addition to their works in Wheeling.

The Tucker Mfg. Company of Newark, Ohio, have been incorporated with a capital stock of $50,000 to operate a sheet plant.

A report from Wheeling, W. Va., states that M. F. Tighe of that city, now assistant secretary of the Amalgamated Association of Iron, Steel and Tin Workers, and a well-known labor leader, will be a candidate for president of the Amalgamated Association, in opposition to Theodore Shaffer, at the annual convention to be held in Wheeling in April. A year ago Mr. Tighe was mentioned as a possible candidate for the office, but because of the fact that the strike was pending his friends decided that it was best for him not to run.

The Cadwallader Tin Plate & Metal Company of Pittsburgh, Pa., recently incorporated with a capital stock of 150,000 by George A. Cadwallader and associates, will operate a tinning plant at Hazelwood, Pa. The company are at present engaged as Tin Plate and Metal jobbers in Hazelwood. A building 50 feet square will be erected, in which will be installed three tinning sets, and an office building will be put up. The company will, for the present, purchase their supply of Black Plates, but it is possible that they may later decide upon erecting a plant for the production of Black Plate.

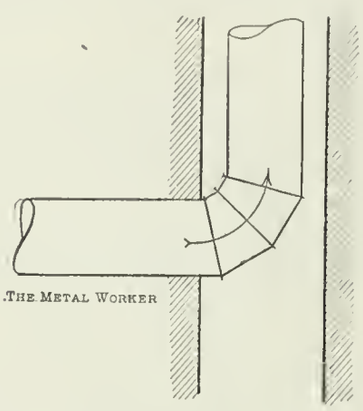
The Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, have ordered S. V. Huber & Co., Pittsburgh, to draw the plans for their new open hearth steel plant, to be erected on a site between Haselton and Struthers, Ohio.

Grant C. Nobbs has opened a sheet metal working establishment at 2520 and 2522 Smallman street, Pittsburgh, Pa., where he proposes to manufacture Steel Stacks, Forges, Exhaust Pipes, Tanks, &c.

It is reported that the American Can Company's factory, at Havre de Grace, Md., will soon be removed to Baltimore, and consolidated with their Norton plant in that city.

Follansbee Brothers Company, Pittsburgh, Pa., are distributing a price-list of Stove Pipe Material, Wood's Refined Smooth Sheets, Wellsville Polished Steel Sheets, American Blue Steel Sheets and Wood's Patent Planished Iron, of which goods they are carrying large stocks, and are prepared to ship to any part of the country on receipt of orders.

A new steel roofing establishment will be opened shortly at Milwaukee, Wis., to be named the Milwaukee Corrugating Company. It will be under the direction of Louis J. Kuehn, who for a number of years has been manager of the La Crosse Steel Roofing & Corrugating Company, La Crosse, Wis. The company last named will continue in business as heretofore, being now exclusively owned by John C. and G. F. Kroner, who have purchased Mr. Kuehn's interest. It is expected that the new venture to be made by the latter will rapidly secure an important position in the steel roofing trade, as Mr. Kuehn established a high reputation by his success in building up the business at La Crosse. He is the inventor of the Kuehn Rain Water Cut Off, which has proved a very popular device for this purpose.



THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

POOR DRAFT IN STONE CHIMNEY.

From A. J. W., Philadelphia.—I have never heard of a chimney that would not draw if it was piped properly, and "F. H. W.," whose inquiry appeared in *The Metal Worker* of January 18, must have the joints in the pipe in the flue tight. He must have the boiler smoke pipe continue on into the flue and connected to the upright pipe with an elbow, as shown in the sketch herewith. The connection should be continuous from the smoke collar on the boiler to the top of the chimney. The pipe should have an ordinary cap on the top. If the fire will not burn, there must be some defect in the

Poor Draft in Stone Chimney.

boiler, but the draft can be tested by disconnecting the pipe from the smoke collar and burning a dozen old newspapers in the flue.

From Hoarse Sents, Red Wing, Minn.—The trouble with the chimney of "F. H. W.," as described in *The Metal Worker* of January 18, is that in starting the fire the cold air in the chimney is too heavy for the force of the boiler blast to push up and out. The smoke can get out more easily by escaping into the cellar. For a remedy I would suggest that he have an opening made into the chimney flue in the cellar, for convenience, provided with a cap or lid to stop it. Every time the boiler is fired, just before starting the fire, this cap should be taken off and some light material, such as shavings or newspapers, that will burn quickly, should be put into the flue to start up the heat and cause an up current in the flue. Smoke from the boiler will be drawn in by the ascending current in the chimney and will keep the chimney warm and drawing. It "does it" for our church chimney. Try it! Better take the stove pipe out of the flue, for it is not needed, as the draft will be easier managed without it.

ZINC FOR MILK VESSELS.

From F. W. K., Mason City, Ind.—I would be glad to have *The Metal Worker*, or some of the readers who have had experience, give me some information as to the advisability of using zinc in a vessel for milk. I put a bottom in a tank 11 x 3 x 1½ feet; the sides were to be of XXXX tin, and as it was impossible to get the tin in large enough sheets in time I used the next best thing available, which was zinc. Now, what I want to know is will the milk have any action upon the zinc, and would it be dangerous if the milk was to stand in this tank not more than four hours before going through a separator?

Answer.—While zinc is not the proper metal to use for vessels to store milk or milk products in, there can be no harm to the milk if the tank is made perfectly clean by a hot soda wash and a thorough wiping every time it is used. The standing of fresh milk in the tank for four hours will not affect the milk to a discoverable degree if perfect cleanliness is observed. The zinc will not be absorbed by sweet milk to a greater degree than by water, and the extensive use of the zinc lined ice water tanks shows them to be considered free from danger. Sour milk or curdled milk, however, should not be allowed in such tanks. It is the acid condition that absorbs the zinc to an objectionable extent.

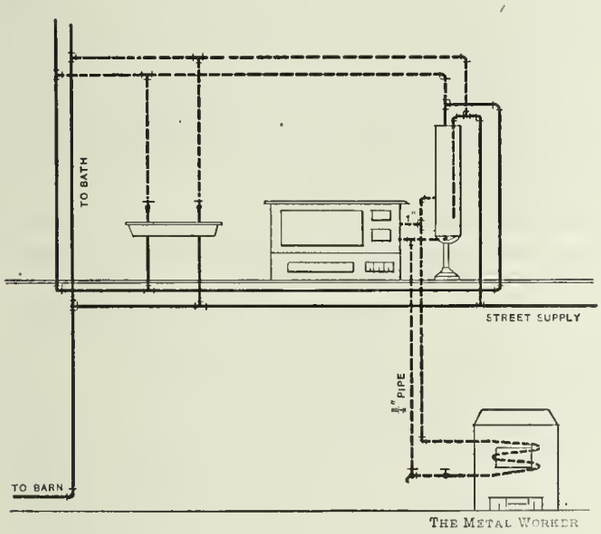
COST OF FLANGES AND VENTILATOR.

From J. R. C., Camden, N. J.—I had hoped that some one would answer in last week's paper the inquiry of "R. & B.," in *The Metal Worker* of January 25, but as they have not I will give a method of arriving at the selling price for such sheet iron work that was pursued in the shop where I worked for a number of years. If a man insisted on having a price in advance we estimated amply for the time that it would take to do the work, and told him that it would cost him, at that time, 50 cents an hour. We told him that the material would cost a given price per pound and would include all the waste, as well as the material used. This was also estimated amply. If I was going to make such work now I would lay out the patterns on the material and then weigh the material before cutting, charging for all of the material, even if a considerable part of it might afterward be used for other purposes. The price per pound on material should be determined by every man according to its cost. The charge for the time is more easily reached; for the cost of material is something that many men never absolutely know. They fail to include in the cost of the work they produce their taxes, interest, rent, the cost of keeping a horse, insurance, light and the wages of the laborer, the clerk and the bookkeeper, where one is kept. If "R. & B." have not found out what this expense amounts to every year in their business, and also the amount of business done in some previous year, so that they can divide the expense and find out how many cents on every dollar should be charged in addition to the absolute cost of materials, they would be very safe in adding 20 per cent. to the cost on their bills for material before they added a percentage for profit. When we made galvanized iron elbows in our shop we used to charge double the weight of material used, and the time of making, when a special elbow was needed for some particular purpose. This may not be the information which "R. & B." desire, but it may be of some assistance to them.

WHY DID THE VALVES FREEZE?

From F. L. W., Traer, Iowa.—Will *The Metal Worker* or some of its readers give us a remedy for the following trouble? We have a church here heated by steam from a boiler in the basement. The church is not kept warm all of the time. It frequently goes without heat from Sunday until Thursday. Under these circumstances the temperature often falls below the freezing point in the auditorium, and when that happens the bonnets of the radiator valves burst from the freezing of the water contained in them. This would easily be accounted for if the valves were closed so that there might be some water left in the radiators; but the valves are always left open when steam is allowed to go down, so that any water in the radiators may drain out and run to the boiler in the basement. The trouble is caused by the steam pressure forcing the water up through the threads of the stem into the bonnet of the valve, where it is held by the pressure and fails to drain out when pressure is allowed to go down.

IS IT POOR DRAFT?



From B. R., Portland, Pa.—Will *The Metal Worker* or some of its readers tell me what is the trouble with a furnace in which the gas will not burn off, but explodes and blows open the feed door, particularly when fresh coal is added and the feed door is shut and the draft door is open? The chimney has a good draft, but, nevertheless, the trouble I describe is found.

EXHAUSTIVE QUESTIONS ON HEATING.

From F. J. G., Wyoming.—Noticing in *The Metal Worker* of January 18 the request of "C. C. C." for information regarding the calculations for all kinds of heating, I would call attention to an article which has been of interest to me. In *The Metal Worker* of March 2, 1895, there appeared a paper by James Mackay, which treated in brief on many points of the subject, and the notes which I took of the paper at that time have been of considerable value to me. Perhaps if this paper, or portions of it, was reprinted, even at this late date, it would be of value to "C. C. C.," as well as acceptable to others.

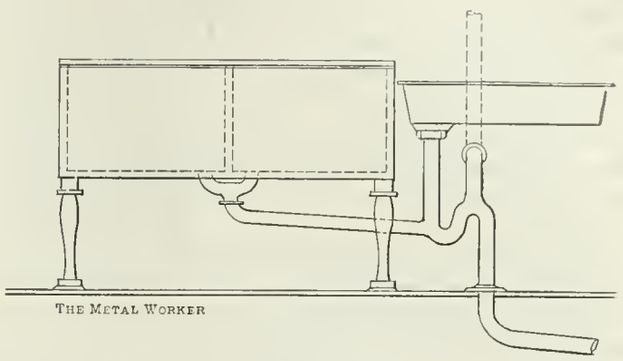
COLD WATER FROM BOTH FAUCETS.

From C. P. A., Port Ewen, N. Y.—In looking over *The Metal Worker* of January 11 I notice the diagram of piping recommended to "I. D. H.," but as it does not agree with my views I thought I would see if something that provided a better plan of circulation could be devised. Would it not be better to connect the stove and the heater to the boiler separately, so that when the stove only was being used the water would not have to circulate through the heater, or if the heater only was in use it would not have to overcome the cooling effect of the cold water back in the stove? I should also favor running the pipes along the kitchen ceiling instead of dropping them down to the cellar. The sketch herewith shows my plan of connecting the piping with the boiler. As this is a problem often met with in these days, I hope that those who have had experience will give sketches of their successful jobs.

Cold Water from Both Faucets.

PROTECT TANK PIPE FROM FREEZING.

From S. & S., Warren, Pa.—We have a customer who has a water tank supported on a steel tower some 80 feet above the ground. This tank is supplied by means of a 2-inch iron pipe, and we would like to know the best method to follow to prevent this pipe from freezing in severe weather when it is filled with water.



Note.—We shall be glad if our readers will give their views on this question. In the meantime we would suggest that the pipe should be heavily insulated. If the water can be kept flowing in the pipe it is much less likely to freeze than if it is allowed to stand still. If some provision can be made for a slight leakage at the bottom this would aid in preventing freezing.

MACHINE FOR PAINTING TIN.

From J. Callaghan & Son, Cleveland, Ohio.—We desire to secure a machine to paint tin in rolls and would be pleased to hear from those who make such a machine.

A QUESTION IN WASH TRAY TRAPPING.

From M. B., Tarrytown, N. Y.—We should like to have the readers of *The Metal Worker* who are experts in sanitary work express their views as to which of the two methods of connecting the waste pipe of wash trays and a sink, where they are set together, is the best. In our opinion the method shown in Fig. 1 is the best, because

A Question in Wash Tray Trapping.—Fig. 1.—The Method of Trapping Proposed.

the sink being used almost constantly the trap is always sealed. Wash trays, in a number of houses, are not used at all, and in many kitchens seldom more than once a week, or once every two weeks, so that there is a chance for the trap seal to evaporate or be broken by oscillation. If the connections are made as shown in Fig. 2 there is a chance for the trap under the tubs to lose its seal.

Note.—We hope our readers will not allow this question to go undiscussed. In the mean time we would observe that the plumbing regulations of many cities would not allow the piping arrangement shown in Fig. 1. It would be pointed out that foul water would lie in the wash tray waste pipe and might be the cause of bad odors. It would also make it necessary to set the sink trap lower than is considered good practice, and owing to the fact that a larger surface of the waste pipe is exposed on the house side of the trap, evidence of the decay of any waste matter that might stick to the sides would naturally find its way through the sink strainer into the kitchen. These are the considerations which would probably govern the plumbing inspector, and which would be provided against in a modern set of plumbing regulations. In either case the fixtures are effectually protected against the entrance of sewer air by the seal of the trap.

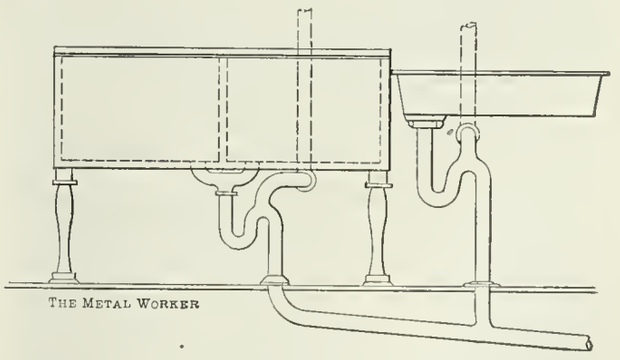


Fig. 2.—Trapped According to Regulations.

LIQUID STOVE POLISH.

From L. P. K., Cockeysville, Md.—I shall be glad to have some reader of *The Metal Worker* present his receipt for making stove polish in liquid form.

The development of the petroleum fields of Kentucky has been greatly stimulated by a number of recent rich strikes of illuminating and lubricating oils, and it is believed that the production of Kentucky oil will in time become an important industry.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and ½c. higher.

Copper rules slightly lower, with little doing.

Pig Lead is dull and firm.

Spelter is weak and very quiet.

Antimony is unchanged.

Nickel is without change.

Aluminum shows no change and is in active demand.

Tin Plates are quiet, with moderate demand at former prices.

Sheets continue in heavy demand; prices are firm.

Sheet Copper was advanced 2c. a lb.

Scrap Iron is active and strong.

Scrap Brass and Copper rule higher.

Pig Iron is scarce, with large demand, and prices very strong.

Hardware is moving in good volume, with prices well maintained.

Plumbers' Brass Goods are irregular in price, owing to advance in Copper. Eastern manufacturers have withdrawn quotations.

Copper and Brass Wire is higher.

Soldering Coppers are up 2c. a lb.

Wire Cloth and Poultry Netting are very strong, with probability of higher prices.

Tinware, Galvanized Ware, &c., are firm and active.

Wire Nails have been advanced 5c. per keg.

Cut Nails were reduced 10c. per keg.

Plain Wire and Staples have been marked up 5c. per 100 lbs.

METAL MARKET.

New York, February 7, 1902.

Pig Tin.—A rather quiet and uninteresting market prevailed throughout the week. The speculative element was almost absent. On Monday prices advanced for Spot Tin, but they eased off the following day, and subsequently reacted in an upward direction, ruling at the close about ½c. per lb. higher than the figures given in our last report. Jobbers quote Straits Pig in small lots at 25c. to 25½c. per lb. The consumptive demand during the week, as for some time past, was very light.

Copper.—The first speculative boom of the year in this metal reached its hight and collapsed during the past week. Wholesale prices were steadily raised until 13½c. was reached for Lake Copper on Monday, but at the close of that day a break occurred, followed by a general easing off. At the close of the week the market showed signs of returning strength, and it was the general impression that the bottom had been reached for the present. The market, however, is in such a peculiar condition that it is impossible to foreshadow its future course, which is not unlikely to be as full of surprises as it has been in the past few weeks. Under the circumstances, the consumptive demand is light, current buying being almost entirely confined to comparatively small lots. Jobbers are still quoting Lake Ingot in small lots at about 13½c. to 14c. per lb., and Casting Copper at 13¼c. to 13¾c. It is conceded that the recent advance has been broken. The movement was ill timed, for consumers bought a three months' supply at bottom figures. The exports of Copper for the month of January were very heavy. Two-thirds of the metal shipped went to England.

Sheet Copper.—As intimated in last week's report, the manufacturers of Sheet Copper have advanced the price of that material, following the upward movement of Raw Copper. Announcement was made on February 3 of an advance of 2c. in the base price of Sheet Copper, bringing it to 18c. per lb., the price at which it ruled prior to the last reduction in the latter part of January. A large amount of business has been booked by the manufacturers in the past two weeks, and even since the latest advance consumers have continued to show an interest in the market, orders coming in freely. Manufacturers, however, while booking contracts for prompt delivery at the current rates, will not guarantee against a further advance. At the same time it is generally regarded in the trade as improbable that prices of Sheet Copper will reach a higher level in the early future. From the condition of the market for Ingot Copper it looks as though high tide had been reached and passed.

Pig Lead.—With the exception of higher quotations in London and the extra 2½c. per 100 lbs. imposed on spot purchases here, the market for Pig Lead was unchanged. There has been but little demand and prices have ruled firm at the figures of the American Smelting & Refining Company. Jobbers quote American Pig in small lots at 4.40c. to 4½c. per lb. St. Louis advices indicate an improved tendency in the volume of business in Pig Lead in that market, with prices holding very firm around the present level.

Spelter.—The market for Spelter is very weak here, and also dull, there being but a light demand for the metal. Good Western brands in small lots are quoted by jobbers at 4½c. to 4⅝c. per lb. St. Louis advices report a slightly heavier volume of business during the past week in the Spelter market there, prices being without change.

Sheet Zinc.—There is a fair demand for Sheet Zinc, which is quoted by jobbers at 6¾c. per lb. for 600-lb. cask lots and 7¼c. for smaller quantities.

Antimony.—No change is recorded in this market. Hallett's and U. S. in small lots are quoted at 8¼c. to 8¾c. and Cookson's at 10¼c. to 10¾c. per lb.

Nickel.—The market is unchanged, small lots being quoted on the basis of 60c. per lb.

Aluminum.—The demand for Aluminum continues brisk. Prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates remains without change of any kind. Large consumers are still placing orders with the leading interests covering their wants for the first half of the year. But the majority of them are understood to have already satisfied their requirements. A fairly large volume of business is being done in a retail way in this market, but more competition has been developed among jobbers, and prices for small lots are hardly as strong as they were a while ago. A few jobbers are said to have cut prices in order to obtain business, a proceeding which is claimed by others in the trade to be entirely unwarranted under the conditions existing in the market. Deliveries are still very backward, and the supply of Tin Plates barely keeps pace with the current demand. American Bessemer Coke Plates, I C, 14 x 20, in small lots, delivered at New York and corresponding points, rule at about $4.80 to $5.05 per box. An advance of 4½ pence per box was made during the week in the price of Welsh Coke Plates, bringing them up to 12 shillings 10½ pence, Swansea.

Sheets.—A full account of the meeting of the independent Sheet mills, held this week in Pittsburgh, is given elsewhere in this issue. An active demand for both Black and Galvanized Sheets is still noted, and prices among the mills are very firm. However, some of the jobbers who have stocks bought when prices were lower are said to be offering Sheets at lower prices than the mills. Jobbers' quotations here are without change, No. 27, One Pass, Cold Rolled Soft Steel Sheets ruling at about 3.90c. to 4c., and Galvanized Sheets at 67½ and 5 per cent. to 70 per cent. off the list.

Chicago advices are as follows: Sales agents are enjoying a good demand for all classes of Sheets, and the independent mills are now advancing their prices, thus making the market firmer. The mills are in most cases oversold, and it is difficult to secure prompt deliveries. Small lots of No. 27 Black Sheets from store are selling at 3.35c. to 3.45c., Chicago. Galvanized Sheets are selling at 70 and 2½ to 70 and 5, with occasionally a lower price being made.

Old Metals.—The demand for Scrap Iron is very active, and prices in this material are strong. Scrap Brass and Copper are also considerably higher on the strength of the advance in raw Copper. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 11 c.
Light and Tinned Copper	per lb. 9 c.
Heavy Brass	per lb. 8¾c.
Light Brass	per lb. 6¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 3 c.
No. 1 Pewter	per lb. 15¾c.
No. 2 Pewter	per lb. 8 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$11.50 to 12.00
Heavy Cast Scrap, per gross ton	11.00 to 11.50
Stove Plate Scrap, per gross ton	10.00 to 10.50
Burnt Iron, per gross ton	6.00 to 7.00

THE PIG IRON MARKET.

New York.—The market is hardening, and it is becoming increasingly difficult to place any orders for delivery during the first half of the current year. One of the leading producers of the Lehigh Valley had advanced prices to $17 for No. 1 and $16.50 for No. 2 Foundry, at furnace, to which 65c. must be added to arrive at the tidewater price. We quote for Northern Irons: No. 1, $17.65 to $18; No. 2 X, $16.75 to $17.25; No. 2 Plain, $16.15 to $16.50; Tennessee and Alabama brands, No. 1 Foundry, $16.25 to $16.75; No. 2 Foundry, $15.75 to $16; No. 1 Soft, $16.25 to $16.75; No. 2 Soft, $15.75 to $16; No. 3 Foundry, $15.25 to $15.50; No. 4 Foundry, $14.75 to 15.

Chicago.—The demand is strong for all kinds of Pig Iron and for all kinds of deliveries. Some large contracts have been placed for Foundry Iron, running through the year. Prices of Foundry Pig could be readily advanced, but sellers are conservative, and are endeavoring to discourage the least indication of "boom" conditions. We quote as follows:

Lake Superior Charcoal	$20.00 to $21.00
Local Coke Foundry, No. 1	16.50 to 17.00
Local Coke Foundry, No. 2	16.00 to 16.50
Local Coke Foundry, No. 3	15.50 to 16.00
Local Scotch, No. 1	16.50 to 17.00
Ohio Strong Softeners, No. 1	19.50 to 20.00
Southern Silvery, according to Silicon.	16.90 to 17.15
Southern Coke, No. 1	16.40 to 16.65
Southern Coke, No. 2	15.65 to 15.90
Southern Coke, No. 3	15.15 to 15.40
Southern Coke, No. 1 Soft	16.40 to 16.65
Southern Coke, No. 2 Soft	15.65 to 15.90

Philadelphia.—Iron is probably scarcer at the present time than it has ever been, and more scarce at the heaviest consuming points than anywhere else. All grades of Iron are in equally light supply; in consequence, prices are irregular and practically unquotable at close figures. With this understanding, it may be said that No. 2 X Foundry ranges from $16.75 to $17.50, the latter figure for February and March delivery guaranteed. The outlook is not encouraging for those who look for lower prices, and the makers of Pig Iron do not appear to have any desire for higher prices, so that the immediate course of the market depends entirely on day to day happenings. Prices, in a general way, would be about as follows for Philadelphia and nearby delivery: No. 1 X Foundry, $18 to $18.50; No. 2 X Foundry, $16.75 to $17.50, and No. 2 Plain, $16 to $16.50.

Pittsburgh.—The market has been quiet in the past week, consumers being pretty well covered, but mainly for the reason that furnaces have little or no Iron to sell. Most of the output of the furnaces up to July is contracted for, and were it not for this fact prices of Pig Iron would be much higher than they are now. We quote No. 2 Foundry at $16.50 to $16.75, and No. 1 at $17 to $17.25, f.o.b. Pittsburgh.

Cincinnati.—There has been quite a satisfactory run of business during the past week. In Foundry Pig Iron the trade has been steady and the volume, while not large, has nevertheless been as much as could have been expected. There is now left but odds and ends for delivery prior to July, and almost all selling is for the last half of the year. The situation is practically unchanged, and were it not for the car shortage on the roads north of the Ohio River the cause for complaint would be nominal. Prices are strong and in the main unchanged. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	.... to $15.25
Southern Coke, No. 2	.... to 14.75
Southern Coke, No. 3	.... to 14.25
Southern Coke, No. 4	.... to 13.75
Southern Coke, No. 1 Soft	.... to 15.25
Southern Coke, No. 2 Soft	.... to 14.75
Southern Coke, Gray Forge	.... to 13.75
Southern Coke, Mottled	.... to 13.75
Ohio Silvery, No. 1	$16.75 to 17.25
Ohio Silvery, No. 2	16.25 to 16.75
Lake Superior Coke, No. 1	17.35 to 17.60
Lake Superior Coke, No. 2	16.85 to 17.35
Lake Superior Coke, No. 3	16.35 to 16.85

St. Louis.—Business in Pig Iron in the past week has been on a very liberal scale and substantial contracts for Iron for delivery as far ahead as November are being placed. Shipments are now being received with a reasonable outlook of promptitude, and it is hoped that the improvement in the car situation will be lasting. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$15.75 to $16.00
Southern, No. 2 Foundry	15.25 to 15.50
Southern, No. 3 Foundry	14.75 to 15.00
Southern, No. 4 Foundry	14.25 to 14.50
No. 1, Soft	15.75 to 16.00
No. 2, Soft	15.25 to 15.50

CHICAGO REPORT.

Scrap Iron and Steel.—Rolling mill stock is quiet, but Cast Scrap is in good demand. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$11.50 to $12.00
Machinery Cast	11.00 to 11.50
Malleable Cast	11.00 to 11.50
Stove Plate (free from burnt)	9.00 to 9.50
Burnt Iron and Grate Bars	6.00 to 7.00
Sheet Iron and Hoops	6.00 to 7.00
Plow Steel	.... to 9.00
Breaking Stock	9.00 to 10.00
No. 2, such as Shovels, Hoes, &c.	.... to 7.00
Old Boilers—whole (Iron)	6.50 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings	10.00 to 11.00
Old Gas Pipes and Boiler Tubes	11.00 to 11.50
Cast Borings	5.00 to 5.50
Turnings	10.00 to 10.50
Horseshoes	12.00 to 12.50

Old Metals.—Conditions are unchanged, the demand being strong with dealers holding for higher prices. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	9½c.
Copper Clips	10 c.
Red Brass	11 c.
Yellow Brass	9 c.
Red Brass Borings	9 c.
Yellow Brass Borings	7¼c.
Light Brass	6½c.
Pipe Lead	3.50c.
Tea Lead	3.25c.
Zinc	2¾c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.
Aluminum	20 c.

Old Rubber.—Business is dull. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6½c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6¾c.
Black Rubber	....	4¼c.
White Rubber	....	8 c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—The continued cold weather keeps trade in lively condition. Chestnut is becoming scarce. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo.	8.25	8.50

THE HARDWARE TRADE.

February has opened with very favorable conditions. The volume of business is excellent and appears to be satisfactory to all classes of trade. There is little difficulty in selling goods to either jobbers or retailers, and manufacturers generally are naturally refraining from making concessions in price. This fact, together with the high price of the raw material and the gradually increasing cost of manufacturing, gives the market a firm and confident tone. The break in the price of Copper and its subsequent recovery have had the effect of unsettling prices in this line, and at the present time more uncertainty exists in this part of the market than any other. A marked feature of the present situation is the fact that many leading manufacturers enter on the season's business with practically empty warehouses, not having the usual stocks of goods ready to draw from. This makes it not unlikely that the demand will be such as to cause something of a scarcity in several, perhaps in many, lines before the season is over. This will depend in good measure on the promptness with which manufacturers can obtain raw material, a matter in which they have of late had some trouble. The lack of transportation facilities, owing to the shortage of cars, has had something to do with this. The improved condition of the market in several lines is a noteworthy feature. The trade will await with interest developments in regard to Tinware, Sheet Metal Goods, and also the outcome of the conferences which have been taking place between manufacturers of Axes. The recent advances in Bolts, Nuts and Wire Nails have had a stimulating effect on the market as a whole. In only a few important lines, owing to special influences, is there indication of any weakness in price.

NOTES ON PRICES.

Plumbers' Brass Work.—The see-saw movement of the Copper market during the past ten days has had a peculiar effect upon the manufacturers of Plumbers' Brass Goods, and it may be the cause of more or less trouble within the ranks of the Manufacturers' Association. Two of the leading Eastern jobbing houses are said to have recently placed large orders for their wants in this line at prices which are understood to have been much below the prices named by the association. The orders under other than the present conditions would most likely have been placed with some of the Eastern manufacturers, but in the present instance they were placed with Western Brass Goods makers. The prices at which the orders were placed were based upon 11 cent Copper, whereas the association prices are based upon 13-cent Copper. It is stated that the Western makers have covered their wants in the Copper line at a lower figure than 11 cents. As they were known to have been strong association men in the past their present action is apparently based upon some motive other than sympathy with the jobbing trade. The withdrawal of prices on Brass Goods last week was not universal. Only the Eastern manufacturers canceled quotations, and up to the present time no new prices have been announced. It is said that several of the larger New England manufacturers were of the opinion they would be able to buy Copper at a lower figure than 10 cents per pound, and while waiting for the market to justify their anticipations they suddenly found themselves with a very small stock on hand and a rising market. This would seem to be the reason for the Western manufacturers being able to secure the business.

Copper and Brass Goods.—The advance in Ingot Copper is having a marked effect on the price of Copper Goods. Copper and Brass Wire is higher, and Soldering Irons are also held at advanced prices. Copper Rivets and Burrs are thus far unchanged, there not having been any advance since the recent reduction in the price. It is not unlikely that further changes will occur, and the market is being watched closely by buyers. Many dealers and consumers are anticipating the probability of higher prices and are getting their orders in.

Tacks.—The Tack market continues in an unsatisfactory condition. While there is some understanding between the manufacturers, especially in the West, prices are, as usual, uneven, and there is a good deal of variation in quotations named by different manufacturers.

Wire Cloth and Poultry Netting.—These two articles have settled down to a solid basis. Referring to these goods, a leading Eastern jobbing house say: "It is the opinion of a large number of jobbers that it is a 'good hold' to have made their purchase of these goods, and much higher prices will be obtained before the season ends. We believe it is an equally good purchase for the retail merchants to place their orders with some one who will guarantee delivery at as early a date as possible."

Tinware, Galvanized Ware, &c.—The Metal Ware Selling Company, as reported in our last issue, have just been incorporated under the laws of New Jersey, with an authorized capital of $250,000. The purpose of this organization is to sell Household Tinware, such as Galvanized, Tinned, Japanned, Pieced and Stamped Ware and Sheet Iron Goods, now made by most of the leading manufacturers of this character of merchandise. This company, however, will have no connection with anything pertaining to Enameled Ware. Negotiations are now in progress with various manufacturers, many of the details being in process of settlement. It is proposed to sell through this company the various lines of goods named above in somewhat the same way that Copper and Cordage are marketed. In view of the prospect of the consummation of an agreement between the manufacturers of these lines the market for the goods concerned has a decidedly firm tone.

Sheet Copper.—As reported in another column, the price on Sheet Copper was advanced 2 cents per pound on February 2, making the base price 18 cents, the same as it was previous to January 23, 1902, when a reduction of 2 cents per pound, from 18 to 16 cents, base, was made. The reason for this action is the advance in Ingot Copper.

Wire Nails.—Under date of January 30 the announcement was made that the price of Wire Nails had been advanced to a minimum of $2.05 in carload lots, f.o.b. Pittsburgh. This advance was not entirely unexpected by the trade, as it had been rumored that higher prices might rule after the first of the month. The market is characterized by a strong tone. Owing to the stocks of Wire Nails in the hands of jobbers bought before the last advance, the New York market is likely to show some irregularity until they are disposed of. This is the case at the present time, as some jobbers are adhering to their former figures for small lots from store, of $2.25 to $2.30, while others are quoting $2.30 to $2.35.

Cut Nails.—The price of Cut Nails was reduced by the Eastern manufacturers on the first of the month 10 cents per keg. This action was taken so as to make more of a difference between the prices of Cut and Wire Nails than there has been of late. The advance in the price of Wire Nails presented a favorable occasion for making a change in prices. Small lots of Cut Nails from store, New York, are now quoted at $2.20 per keg.

Wire.—At a meeting of the manufacturers in Chicago last week, prices of Plain Wire were advanced $1 per ton. Fence Staples were also advanced to an equal amount, or 5 cents per 100 pounds. The demand for Wire is large, and the market is reported as being firm, Plain Wire in small lots, New York, is quoted at about 2.25 cents, and Galvanized at 2.60 cents.

The machinery and other stock in trade of the Iron Clad Paint Company, Cleveland, Ohio, have been purchased by the Cleveland Facing Mills Company, which is operated by the J. D. Smith Foundry Supply Company. The outfit will be moved from the old plant of the Iron Clad Paint Company, on Seneca street, to the facing mills plant on Carter street, which will be enlarged to accommodate it.

A Century of Growth.

"The Progress of the United States in Its Material Industries" is the title of a monograph issued by the Treasury Bureau of Statistics which contains a series of statements which show the rapid development during the century of the important factors in the present prosperity of the country. These tables, which occupy a number of closely printed pages, show the development in products of the field, forest, mine and manufactory, the growth in our population, wealth and commerce, the extension of railways, telegraphs and other methods of communication and transportation, and present an interesting and instructive picture of the progress of the United States and its people during the period from 1800 to 1901.

Among the interesting facts presented by these tables are the growth of production, the growth of commerce, the growth of wealth, the growth of money in circulation, the growth of deposits in savings banks and the increased number of depositors in savings and other banks, the decrease in interest on the public debt and many other facts of this character. On the production side, it may be said that the cotton produced has increased from 155,556 bales in 1800 to 9,436,416 bales in 1900; the wool produce, from 35,802,114 pounds in 1840 to 302,502,328 pounds in 1901; wheat, from 151,999,906 bushels in 1866 to 522,229,505 bushels in 1900; corn, from 867,946,295 bushels in 1866 to 2,105,102,516 bushels in 1900; copper, from 650 tons in 1850 to 270,588 tons in 1900; pig iron, from 165,000 tons in 1830 to 15,800,000 tons in 1901; petroleum, from 21,000,000 gallons in 1860 to 2,661,233,568 gallons in 1900; coal, from 3,358,899 tons in 1850 to 267,850,000 tons in 1891, and gold, from $50,000,000 in 1850 to $79,171,000 in 1900.

During the period under consideration exports of merchandise have grown from $70,971,780 in 1800 to $1,487,764,991 in 1901, the per capita in 1800 being $13.37 and in 1901 $18.81. The imports of merchandise have grown from $91,252,768 in 1800 to $823,172,165 in 1901, while the per capita imports have fallen from $17.19 in 1800 to $10.58 in 1901.

Turning to the figures which show the net results of these developments, those relating to wealth, circulation, deposits, &c., the tables show that the wealth has increased from $7,135,780,000 in 1850 to an estimated $94,300,000,000 in 1900; the per capita wealth, from $307.69 in 1850 to $1235.86 in 1900. The public debt, less cash in the Treasury, was in 1865 $76.98 per capita and in 1901 was $13.44 per capita, while the interest on the public debt, which in 1867 was $143,781,592, had fallen to $32,342,797 in 1901. The figures of money in circulation show in 1860 a total of $485,407,252 and in 1901 $2,175,387,277. The circulation per capita in 1860 was $13.85; in 1901, $28.02. The deposits in savings banks in 1830 were $6,973,304; in 1883, 53 years later, they were $1,024,856,787, and by 1901, a further period of only 18 years, had reached $2,597,094,580. Meantime the national banking system had come into operation, and in 1865 the deposits in national banks were $500,910,873; in 1880, $1,006,452,853, and in 1901, $3,044,600,000. The number of depositors in savings banks grew from 38,085 in 1830 to 1,067,061 in 1866 and 6,358,723 in 1901. Railways grew from 9021 miles in 1850 to 199,378 in 1901, and freight carried 1 mile increase from 39,302,209,249 tons in 1882 to 141,162,109,413 tons in 1900, freight rates falling meantime from 1.24 cents per ton per mile to 75-100 cent per ton per mile.

Fletcher, Russell & Co., Limited, of Warrington, England, have favored us with a copy of their "Workshop and Laboratory List, No. 229," which will be interesting to those who handle gas specialties. The first section is devoted to blow pipes for various purposes, with foot blowers and power blowers for furnishing compressed air to be used with them, and the second section contains a variety of muffle furnaces for burning china. A prospector's set, packed in a crate, with all the necessary apparatus for assaying and refining gold, and equipped with furnaces, crucibles, burner coils and tongs is shown, also several styles of crucible furnaces adapted for carbonizing and annealing engraved dies, as well as for melting the softer metals and larger furnaces for melting jewelers' sweepings. Some of the furnaces are so arranged as to be equipped with either gas or oil burners. Furnaces are also shown for heating wire drawers' plates, rivet heating, hardening and annealing, and for heating drills and file blanks, as well as special furnaces adapted for the use of pattern makers and small machine shops. Tobacco presses, japanners' ovens, branding irons, ladle furnaces, tinsmiths' fire pots, self heating soldering coppers, brazing hearths and glue pot heaters occupy another section of the catalogue. The last part is devoted to water heating apparatus, and a variety of burners adapted for the various requirements of those who have to construct special apparatus for using gas fuel.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 ~ Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, $1.00 Postpaid

Patented Feb. 12, 1895.

COST	SELL

Analysis No. 72,339. NEW YORK, Dec. 7, 1896.
We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.
The enamel coating is homogeneous, of extra thickness, and great purity.
It is *entirely free from arsenic, lead* and *antimony*—metals so often found in enameled goods.
Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

{ Pierre de P. Ricketts, E.M., Ph.D.

Analysis No. 14,180. NEW YORK, May 5, 1897.
LALANCE & GROSJEAN MFG. CO.:
GENTLEMEN—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.
We find this enamel is *absolutely pure and free from Arsenic, Antimony, Lead and other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,
RICKETTS & BANKS,

POLYGON

CONDUCTOR PIPE.

In presenting our Patent Polygon Sheetmetal Conductor Pipe, we feel confident that its merits are shown sufficiently in the cut to not require a long description.

The pipe is expansive. Through its peculiar polygon scalloped spiral construction, producing sufficient expansion and resistance, an artistic effect is also secured, not possessed by any other conductor pipe in the market.

Ice forming in it will not, by slipping, as in other conductors, burst joints and seams, but will descend gradually, without injury to the pipe. Water, in heavy rains, will discharge more freely, as the pipe will not choke.

Considering quality of material used and workmanship required in producing the pipe, also the durability and design obtained, the Patent Polygon is, besides being the best, the cheapest in the market.

Made in copper and galvanized iron. Write for catalogue and information free. Address

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

BERGER'S "Classik" METAL CEILINGS

Did not come by chance, but were the result of forethought, enterprise and effort. We realized, in a measure, at the outset, the importance of the undertaking, but as the work progressed its scope grew larger and larger until it was far beyond the original limit.

The outcome enables us to offer what is by far the largest and most artistic assortment of metal-ceiling designs ever placed upon the market.

To accomplish this has required years of persistent and expert effort, but that effort has been fully justified by the results.

It has placed our line far in the lead and has opened for it a field of usefulness once considered unattainable for this material.

Berger's "Classik" Metal Ceilings

combine the artistic effect of plastic relief with the mechanical excellence and staying qualities of sheet metal.

Wide-awake dealers who appreciate the advantage of handling high-art goods should get in touch with the high-art line we offer.

Berger's "*Classik*" Metal Ceilings win orders where the general run of stamped material would utterly fail to receive consideration.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.

New in Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

NO. 2 FOOT PRESS

Has 18 in. throat, punches ⅛ in. holes in ⅛ in. stock. Can punch up to 2 in. holes in thin stock. Worked by foot or hand power or both. Horn allows for punching pipe; also has gauge for spacing holes.

Good one and always gives good satisfaction. Send for price.

R. M. CLOUGH, - - Tolland, Conn.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

WRITE FOR LOWER PRICES.

We would like to proclaim it from the housetops, that a Paragon Furnace brings a dealer a good deal more money than his profit on that furnace. The satisfied customer will come back as surely as a cat will go back to his old home, and your customer will believe that everything you sell is as good as the Paragon Furnace. For instance, here's what a Philadelphia man wrote to his dealer:

"The work done is perfectly satisfactory and I will patronize you when desiring anything done."

QUICK MEAL

GASOLINE STOVES.

Quality is what makes and maintains a reputation.

Quality in material, design and workmanship is what has made the name "Quick Meal" famous all over the world.

Quality, combined with simplicity, is what has placed the "Quick Meal" Gasolines first in the eye of the dealer and first in the eye of the consumer.

Quality, together with special designs and distinct features of their own, is what places the dealer who handles the **"Quick Meal" Gasoline Stoves** in a position to command the best trade and make the most profit.

Quality and profit are necessary to protect a good name or build up a good reputation. "Quick Meal" Gasoline Stoves will make for the dealer both profit and reputation.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

MILWAUKEE, WIS.

It isn't the amount of money you pay for a furnace that insures results, but the real value of the article itself determined by your customer, who compares its economy in fuel and heating capacity with some other furnace he has used before

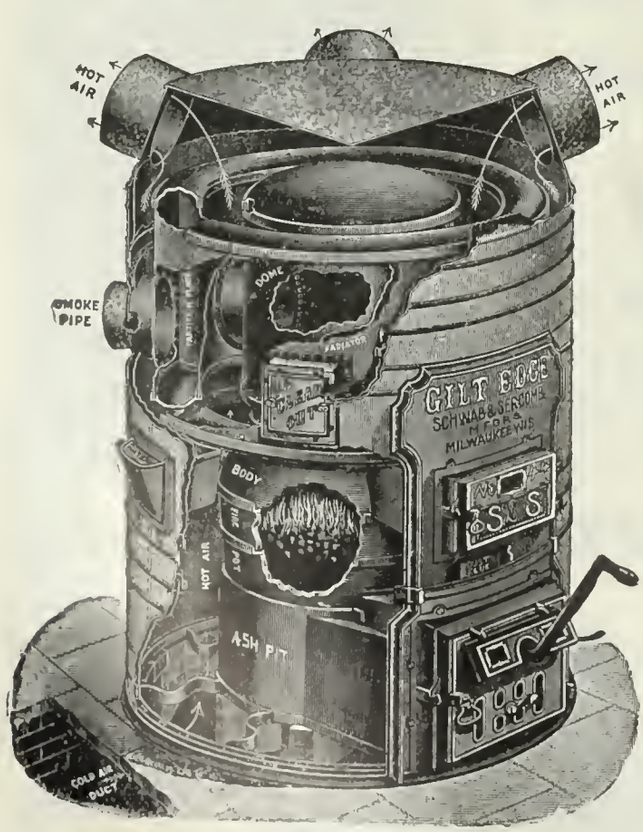
The manufacturer who doesn't get one good, enduring "kick" on at least one out of every hundred furnaces sold, is either very lucky or has an exceptionally good article.

In **Not One Single Instance** have we ever received complaint as to a **"DIGHTON"** using too much coal.

In some instances we have made special low prices to introduce it where it has never been sold before.

After a thorough trial, the first customer becomes a strong supporter of the **"DIGHTON"** and we never hesitate about referring any inquirer to him, no matter whether he has advised us as to whether it has been satisfactory or not.

In over 30 years' experience in making and selling furnaces we have never put one on the market that warranted greater economy and satisfactory service to the user.



DIGHTON FURNACE CO., = Taunton, Mass.

Your Guarantee is Good,

If backed up by our line. We make many kinds and sizes of steam and hot water boilers, and you as a dealer ought to know all about this line. Let us send you our printed matter and post you on the standard line. Write to-day.

KEWANEE BOILER COMPANY

KEWANEE, ILLS.

Gilt Edge Warm Air

AND

Combination Heaters

have merits that are all their own. They are made in a large variety of styles and sizes, each adapted especially to a certain class of fuel. We are manufacturers of a complete line of Warm Air Registers, Safety Pipe and Tin Galvanized Iron Furnace Fittings.

The Stanton Seamless Heater,

PORTABLE CASED.

CADIZ, OHIO, June 18th, 1900.

GENTLEMEN:—We had a Stanton Furnace No. 84 put in last Fall and have nothing but praise to say of it. The space heated is 50,400 cubic feet, which it keeps comfortable in the coldest weather. Our fuel costs only one-fourth what it used to and besides is perfectly clean. We take pleasure in recommending it. Respectfully,

J. EHRHART, Hotel Ehrhart.

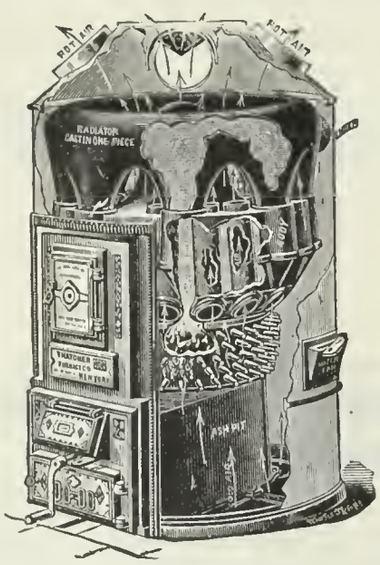
Bergstrom Bros Co.

NEENAH, WIS.

They regulate heat in residences, offices, stores, mfg. plants. Guaranteed.

The Howard Thermostat Co.

West Water Street, Oswego, N. Y.

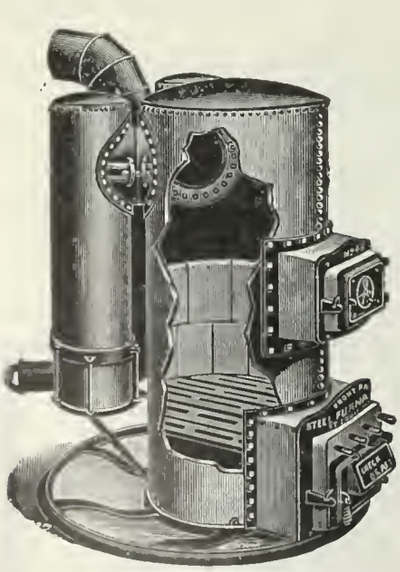


No electricity or compressed air. Simple as a heavy spring motor can be.

Would like to send you their catalogue and give a few reasons why you should sell their Heat, Valve, Draft and Damper Regulators. This should be an interesting topic. We have the most simple thermostat made; also the most sensitive. Only three parts—a sensitive and powerful sensitive plate, a heavy spring motor made of brass, and common pulley connections. Just enough material to do the work satisfactorily, but not one atom too much. They do "straight work," without the aid of outside agencies. No other thermostat on the market can do more with all of its electricity and compressed air connections.

THEY SAVE THE COAL

WHICH IS WASTED BY THE WRONG OPERATION OF FURNACE OR BOILER DAMPERS.



A Combination

OF excellent workmanship, durability of construction, economy of operation and an intelligent and scientific application of the sanitary principles involved in modern warm air heating conspire to place the Thatcher Furnace at the head of this class of heaters.

WRITE FOR CATALOGUE.

Thatcher Furnace Co., WARM AIR FURNACES, RANGES, STEAM AND HOT WATER HEATERS. 240 Water St. N. Y. WORKS, Newark, N. J.

A FEW POINTS OF SUPERIORITY

Fire pots are of fire clay tiling and never burn out.
Radiator surface in proportion to grate surface unusually large.
Only absolutely gas tight furnace made.
Novelty of construction makes an easy seller.
Tested for fifteen years.

Repairs are seldom necessary.
Are guaranteed to burn hard or soft coal.
No direct draft to warp out of shape, nor packed joints to leak gas.
Katalogue and prices will be mailed you upon application.

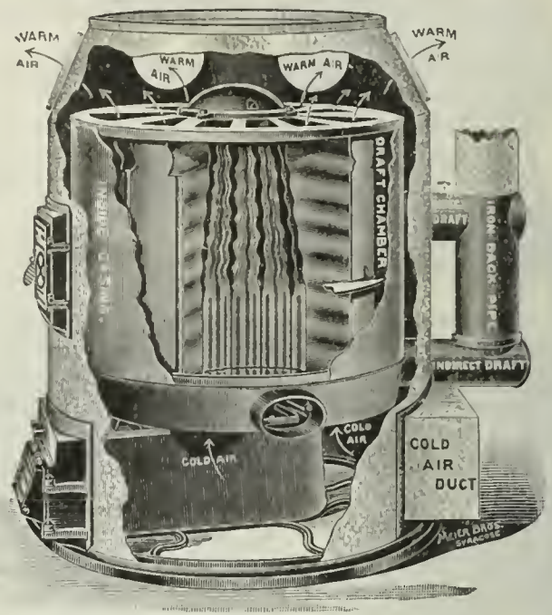
TRIMONT MFG. CO., Roxbury, Mass., U.S.A.



The Kelsey Warm Air Generator.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

Ask for booklets **"KELSEY HEATING"** and **"OPINIONS."**

Enormous Consumption of Pig Iron.

The enormous current consumption of pig iron is fully reflected in the monthly statistics published by *The Iron Age*, which show that during the month of January the United States produced, according to almost complete returns, over 1,450,000 tons of pig iron. In spite of this the furnace stocks of iron declined from 218,084 tons on January 1 to 154,200 tons on February 1. This means that over 1,500,000 tons of pig iron were melted in the United States during January, which would be at the rate of 18,000,000 tons a year. This is an extraordinary record. *The Iron Age* estimates that the weekly capacity of the furnaces in blast on February 1 was 340,612 tons, as compared with 298,460 gross tons on January 1 and 324,761 tons on December 1, 1901, which was the previous highest record. Notwithstanding this enormous output, it would seem, judging by the January rate of consumption, to be inadequate if there is no hitch anywhere in the whole chain of industries, and even if a few old stacks and a limited number of new furnaces are put to work. Unfortunately disturbances to production have shown themselves this month. Storms have again thrown the whole transportation system in important sections into disorder and a number of furnaces have been forced again to resort to banking. It is considered very doubtful, therefore, under the circumstances, whether the output for February, at the record its first day held forth, will be realized, although every pound of it is needed.

Hindrances in Retail Business.

Business in every line is necessarily attended by difficulties and hindrances. These are accepted as a matter of course by the intelligent merchant, who, recognizing them, faces in a practical and sensible way the problem as to how they are to be met and overcome. His endeavor is, in spite of them, to make a success of his business.

Many of the hindrances in the hardware trade, for instance, are connected with the innovations which are being introduced in the old ways of doing business, as illustrated in the catalogue houses and department stores. Others are the result of competition within the trade, as merchants in many places are forced to compete with jobbing houses and manufacturers as well as their own legitimate rivals. The attractions offered by the larger towns and cities have, too, an important influence in drawing customers from the rural districts and smaller villages. In special lines the fact that high prices are prevailing, owing to the operation of combinations or other causes, is recognized as having a repressing effect on sales and profits, although this influence is not especially marked in prosperous times like the present. The increasing expense of doing business as it becomes more complex and takes a higher plane, thus keeping pace with the commercial progress of the times, is a factor which must be constantly reckoned with. The wise merchant must take these and other similar matters into account as the conditions under which it is necessary for him to carry on his business. In many instances these difficulties are so positive and obstinate that the task of mastering them presents a serious problem.

There is, however, another class of difficulties which are to a good extent within the merchant's control, and which it behooves him to eliminate from his bundle of troubles. Surely the external and unavoidable hindrances should be sufficient to satisfy any reasonable man, without the addition of others which are unnecessary, and at the same time are frequently the most serious obstacles to the success of the business. Most of these come under the head of bad business management, and result from the inattention or personal limitations of the merchant. Among the hindrances of this character are the following: Letting things get into a rut; suspicion of other dealers; incompetent clerks; little knowledge of the business; paying too high prices for goods; leaks at the money drawer; investment of needed capital in outside enterprises; overbuying; unnecessary cutting of prices, carrying incomplete stocks; lack of attention to business; giving too much credit; losses through bad accounts; lack of business system; refusing to recognize changed business conditions. It is easy for the merchant to discover and denounce the things in his circumstances or in the trade at large which militate against success, but it is far more difficult and far more profitable for him to find out the things in his own establishment which are hindrances to his success, which, if corrected, would give a new tone to his business, increasing both the pleasure of transacting it and the profit derived from it.

The Fire Danger.

The fire record of the past week or two is startling in its extent and in the serious character of the losses caused by the disasters. The columns of the daily press have fairly teemed with accounts of conflagrations, great and small, in various cities and towns throughout the country. On one day alone—Sunday last—no less than six great fires occurred, including the destruction of a large part of the business section of Paterson, N. J., with a loss conservatively estimated at $8,000,000; a great factory fire in Brooklyn, involving $400,000, and a dock fire in Jersey City at a loss of $300,000, with other conflagrations in St. Louis, Scottsville, Ky., and Wapella, Ill., aggregating a loss of another $400,000. These, together with the great blaze in Waterbury, Conn., last week, which wiped out $2,500,000 worth of property in the center of the city, and disastrous conflagrations reported this week in Springfield, Ohio; Springfield, Mass., and other places make the record for the first half of February an exceedingly serious one. The recent spell of ex-

treme cold, accompanied by strong winds, often making the efforts of the firemen futile, is doubtless the main cause of this epidemic of fires, and February is usually accounted one of the worst months of the year, from the point of view of the insurance companies. But it would seem that much of this terrible waste of property, and too often of life, by fires should be obviated in these days of progress. The methods of fire fighting, we are told, have kept well abreast of the advance of the times. Yet, in the cases of Waterbury and Paterson, they were found utterly inadequate to cope with the existing conditions. In both cases the flames, originating in inflammable structures and fanned by high winds, were quickly driven over neighboring buildings, starting a conflagration which the utmost efforts of the firemen were powerless to check. This would be the case in any place in which flimsy structures are permitted to exist alongside of more stable buildings. Stringent building laws and their strict enforcement and the adoption of fire proof construction in the crowded centers of population, while not an absolute panacea, would seem to be the best check against fires in cities. That has been the experience of New York, where there has been, of late years, a marked freedom from widespread fires. At the Paterson fire, it was found that the only large buildings which remained standing were the only three of modern fire proof construction existing in the burned area of the city.

The Cultivation of Foreign Trade.

United States consuls and others acquainted with commercial conditions abroad constantly reiterate the advice to American manufacturers and exporters desirous of securing foreign orders to send representatives directly to the foreign field that they wish to cultivate, taking with them, where possible, samples of goods. The result of such a method of securing foreign trade is illustrated in a recent report to the State Department by our consul at Smyrna. He says that a representative of a New York export house recently visited Constantinople with his samples, and in about three months had sold $40,000 worth of American goods. From thence he went to Smyrna, hired a room and displayed samples of several lines of tools, shelf hardware, cutlery, leather and toys, and in four weeks sold $25,000 worth. The consul points out that it would have been impossible to get this business by correspondence, through the United States Consul or otherwise, or by the distribution of catalogues or other advertising matter. A good traveling representative with a line of samples and having, if possible, the co-operation of some substantial native house, is almost always able to pave the way for an extensive business in American goods, provided the lines that he offers are suitable for the localities in which he operates. Evidence is multiplying pointing to the comparative ineffectiveness of catalogue advertising in foreign countries, especially where, as in so many instances, the catalogues are sent abroad in the English language and with prices in American currency. There is nothing like being on the spot and having something substantial to show to the foreign buyers, who are not all as intelligent or as easy to interest in goods of foreign manufacture as might be desired.

Modern Business Facilities.

Probably but few people realize what an extraordinary revolution in the methods and facilities for doing business has been accomplished in the past twenty or twenty-five years, and under how much pleasanter and more comfortable conditions we carry on our work to-day than our predecessors enjoyed less than a generation ago, before the general introduction of electric lights, elevators and mechanical heating and other appliances, together with the innumerable labor saving and comfort securing devices that are now common in modern business offices and buildings. Twenty years ago the telephone and typewriter were practically unknown adjuncts to the business office. They were regarded more or less in the light of scientific or mechanical toys. To-day they are among the essentials of every business office. And so with many other modern facilities which are now looked upon in the light of ordinary, every day equipments for doing business. Then the change in the character of the quarters in which business is done to-day is very marked. Some of the wealthiest firms in our large cities a generation ago were content to carry on their business in dingy and ill lighted and ventilated quarters in shabby old buildings located on side streets. To-day it is a poor and unaspiring concern that is content with less than a suite of airy rooms, well lighted and heated, in one of the large modern office buildings. Indeed it has become almost essential to the reputation of a business house that the accommodations it provides for its employees should be of a comfortable and even luxurious character. How hard would it be for us to be forced to go back to the conditions and surroundings which existed in the business world a quarter of a century ago, and equally so to the slow and comparatively laborious methods of doing business that were in vogue in those days. Modern progress has been especially marked in this direction. And, with the strenuous and exacting life of the modern business man, it is well that the doing of business has been so greatly facilitated. With all of the up to date accessories in the modern business establishment as much work is now done in one hour as would have taken the same number of people a whole day to accomplish before the modern facilities were introduced.

The annual report of the Board of Electrical Commissioners of South Norwalk, Conn., one of the few municipalities which both owns and operates a municipal lighting plant, showed that during the fiscal year ended October 12, 1901, gross profits of $7496 were realized from the operation of the plant. The city supplies street and commercial lighting, and also power. The report shows that the commercial service practically doubled during the year, and the commissioners advise that an enlargement of the plant will shortly be necessary. This experience in municipal ownership is certainly encouraging to the advocates of that policy, especially as it is understood that the rates charged by the city of South Norwalk for electric lighting are considerably lower than they would be under any system of private ownership.

Light and drainage may hereafter be procured for Baltimore, Md., by the adoption of a plan which presents many novel features and great possibilities. The method proposed, as described by an exchange, is to build a canal between the city and the Susquehanna River, which will convey a sufficient amount of water to flush the harbor and produce the sanitary conditions needed for over a million population. The water would be brought in at an elevation of about 125 feet—a fall, which, it is claimed, would furnish power rivaling that of Niagara. With it the city could light the streets and operate the Water Department pumps, and it would have enough left to supply all the inhabitants of Baltimore at a much lower rate than the cost of steam, which will produce a revenue of from $1,000,000 to $2,000,000 annually. The canal would be about 35 miles long, and, if it could be excavated through earth, would cost about $4,500,000.

WHAT SHOULD THE FURNACE MANUFACTURER KNOW?

BY G. R.

The headline of an article by "J. K." in *The Metal Worker* of January 25 was, in my opinion, unfinished. If it had read, "What Should the Manufacturer of Furnaces and the Furnaceman Know?" the field would have been more fully covered. However, the question, as it appears, should be well taken, and the furnacemen throughout the country should endeavor to dissect the inquiry and give some good information on the subject.

In the first place, I will ask why there have never been any fixed rules or tables established for hot air heating? This question is easily answered. Because there is hardly a furnace on the market properly proportioned, and unless a furnace has enough heating surface for the grate surface it is a case of guess work from beginning to end. Ten to one the furnace not proportioned right will give trouble. Then the furnaceman's trouble begins. He kicks to the manufacturer, and the manufacturer condemns the furnaceman's work. Very often the work should be condemned. My experience has been very extensive, and, in examining a large amount of furnace work, I find the furnaces giving the best results to be those having from 40 to 50 square feet of radiating surface to one of grate. There are furnaces on the market having not more than 12 square feet of surface to one of grate, and they are rated to heat from 24,000 to 30,000 cubic feet of space. Possibly they will do it under good conditions; but for a general class of work they will only do it for a short time, and then only with an extravagant waste of fuel, after which they are fit only for the junk dealer; whereas, if they were properly constructed and had plenty of radiating surface they would last indefinitely.

I have exhausted all means known to mankind to find some positive data on hot air heating, but as yet nothing has been found that excels good judgment and common sense. I have searched the high schools, the libraries, the technical schools, and worried the patience of as many heating and ventilating engineers as could be learned of, but all in vain. There are a few practical books on hot air heating, but, as a rule, the everyday furnaceman objects to spending from $1.50 to $5 for a book that he is not sure will help him in his daily work. The best rules that I could give here would be: Use a furnace with plenty of radiating surface; be sure of a good chimney; locate furnace as centrally as possible; have large hot air pipes, and registers in proportion, and, last but not least, give the furnace plenty of cold air. If you are afraid you will have too much cold air, put a damper in your cold air duct. It is easier to regulate it than to have the job condemned. There are hundreds of installations giving trouble from this simple cause.

I have installed work where the furnaces were well proportioned, and by following some self made rules could get the best results. But, on the other hand, where the furnaces were not properly proportioned, the same rules would fail. Therefore the importance of manufacturers properly proportioning their goods is evident. Of course, it is important to have short runs of pipe, registers well located and avoid abrupt bends, &c. I hope the furnacemen throughout the country will keep the subject before them until it is thoroughly discussed. Why do not the heating and ventilating engineers help in this matter? No doubt they would be benefited as well as others.

I will further say, as a rule, the architects throughout the country are not practical in hot air heating by any means. The architect will plan a building, and, of course, has an idea as to what furniture the building will be furnished with. To accommodate a sideboard or china closet, he will make the heating man place a register where it will not be effective enough to heat the room. At other times he will try to force a heating contractor to put in a side wall register in a 4-inch partition wall on the first floor, where it will be absolutely impossible to get a pipe large enough to heat the room properly. The builder makes a great mistake in not letting the heating contractor lay out his system and have all openings of proper size and location provided for in the beginning. He cannot expect good results if he waits until the building is nearly completed and then begins to look out for his heating apparatus.

My opinion is, the practical man is the one who will have to force the advance of hot air heating. We should try to convince the manufacturers that we need more effectual heating surface in their furnaces. Then we can give good results with their goods. I am trying to get the school boards in my section interested enough in heating and ventilating to have it taught in the public schools. Some of them are taking well to the subject. I trust this will encourage others to discuss this branch of their work, and I will anxiously look for their replies to "J. K.'s" question. Later on I hope to furnish the readers of *The Metal Worker* with some data which I have found to work successfully.

Presentation to Fred. W. Gardner.

On the eve of his retirement from the active management of the Chicago house of the Michigan Stove Company Fred. W. Gardner was presented by all of the

Presentation to Fred. W. Gardner.

traveling representatives of the Chicago branch of the concern with a beautiful solid silver loving cup, as a token of the attachment and esteem of those with whom Mr. Gardner had been so long associated. The illustration of the cup, showing its inscription, given herewith, indicates the handsome and massive character of the gift. In adition Mr. Gardner was presented with a beautifully bound edition of the complete works of Thackeray, with the compliments of all the office employees, and, to make his cup of happiness full to overflowing, a Pianola was sent to his house, with the compliments and best wishes of his fellow directors of the Michigan Stove Company. Seldom does a man sever a business connection under such pleasant circumstances as Mr. Gardner, carrying with him such substantial tokens of the good will and esteem of those whom he leaves behind.

At the annual meeting of the stockholders of the Sheridan Stove Mfg. Company of Quincy, Ill., recently held at the office of the company, Fourth street and Payson avenue, it was decided to increase the manufacturing facilities and at the same time enlarge the force of employees. We understand that a new warehouse will be erected and the molding room will be extended to Fourth street, thus giving room for about double the present number of molders. The stockholders also elected a Board of Directors and officers for the ensuing year.

GOOD FURNACE WORK.

BY A. F. M.

It is a pleasure to me that so many in the furnace trade have discussed different phases of the work in *The Metal Worker*, in the last few months particularly. I congratulate the trade on the desire, which seems to be clearly shown, of doing better work and the best work that the different men know how to do. That good work is being done in the furnace trade is beyond question, but I would divide the good work that is being done under two heads—the practical and the theoretical.

GOOD PRACTICAL WORK.

To do good practical work naturally requires a comprehensive knowledge of every detail, which means that when a customer comes the opportunity must be embraced to explain just what will be the best thing for his particular building. This should be done on a cause and effect plan, so that if a competitor is willing to heat the building for less money the customer will be sufficiently well informed to know what he wants and won't be satisfied with the character of job which the lower bidder is willing to do. I suppose many furnacemen would look on this purely as selling, but I would like to point out that a man may be a good salesman and not be able to do what I have just pointed out as an important part of the work.

Good practical work should include the selection of a furnace, of whatever grade and price, and so constructed that it will be gas and dust proof and reasonably durable, and as efficient as the market will afford for the price paid. This will require some study of different constructions and of the various goods on the market, and may necessitate the purchase of furnaces from two or three different manufacturers in order to meet all the demands of your community. It is important, when the sale is made, that the furnace be located in the building at the point which your judgment decides is best, regardless of the opinion of the architect or the owner. You can rest assured that you will have to be responsible for any failure on the part of the furnace to measure up to their views of what it should do, and they should be impressed with the fact that, having made a specialty of your line of business, you are best qualified to judge where the furnace must be placed in order to do its best work.

Then there are different kinds of sheet iron work. The drums of a sheet iron furnace and the casing and bonnet of any kind of furnace must be made in a substantial and workmanlike manner, so that they will fit snugly and hold together with any reasonable treatment. There can be no doubt that advantage attends the connection of the furnace collars with the top so that they will be practically air tight, and set at the right angle so that the hot air pipe may be carried in a direct line to the register or stack it is to supply. The tin for the hot air pipe should have sufficient body and be coated heavily enough to pass through several seasons without rusting. Benefit will be derived if a small length of pipe is finished with a bead about 1 inch from the end, so as to insure stiffness and an air tight joint. The bead should be small, and if the pipe is carefully fitted it may be omitted for the purpose of avoiding friction. The connection of the round pipe to the register boxes and vertical stacks, even in the cheapest contract work, should be made with an enlargement and so arranged as to avoid abrupt turns and friction. In many instances a little ingenuity will accomplish this result as cheaply as abrupt connections can be made.

The failure of different pipes to receive and furnish the same volume of hot air is due in many instances to just such little things as the connections at the bottom of the stack and at the register box. Furnacemen must learn the importance of these comparatively small things, otherwise much of their work will be unsatisfactory to customers and be found extravagant in the use of fuel. If the furnaceman is to escape the disagreeable comparisons made between the system of heating which affords him a living and other systems of heating, he must labor to avoid friction at every point by the use of good workmanship, good judgment and good materials.

GOOD THEORETICAL WORK.

The furnaceman has made practically no records for the basis of the theories which have guided him in his practical work. To accomplish what is a growing necessity in this field selfishness must be obliterated and a broad spirit of generosity must be cultivated. The man who asks "Where do I come in?" cannot be expected to be of much assistance in this work. The need of it, however, has left this branch of heating open to the imputation that it is by no means an exact science, but is governed by thumb rules, cut and try sheet metal work or "I guess that pipe will be big enough" methods in designing work. I would suggest that furnacemen keep some record of the work they do. This would be a comparatively small task, which will only need a few outlines for a beginning, experience subsequently suggesting more. As a beginning I would suggest that the records include the square inches of grate surface and the square feet of heating surface in the furnace; the space heated; the wall surface and the glass surface; the area of the hot air pipes leading to the different rooms; their combined area and the area of the cold air supply pipe.

If a few of the readers of *The Metal Worker* would just go over some of the jobs that they have done in houses and tabulate the record, and then strike an average on the different jobs, such a table would be of great interest and value. Those who have done much church heating could present an interesting table of that character of work. If besides this table the temperature of the air flowing from the registers was recorded, with the record of the temperature on the outside, this information would add to the interest and value of the records. If the furnaceman enlisted the aid of men working in his shop in making such a tabulation and record, and the record was kept so that it could be readily referred to by all of the men, benefit would be derived that would more than pay for the time spent in the compilation; there would be less errors in judgment, failures in heating and complaints, and a better reputation in the community would be built up, with the result of better profits to the furnaceman.

Cleveland Co-operative Stove Company.

The annual meeting of the Cleveland Co-operative Stove Company of Cleveland, Ohio, was held on Saturday, February 1, when the following directors were elected by the stockholders to serve for the ensuing year: N. P. McKean, J. H. O'Brien, Jacob Widlar, Stephen Buhrer, C. H. Coit, Capt. P. Borland, James H. Clark, Sr., M. G. Watterson and John Gill. The directors met after the stockholders' meeting and elected officers, as follows:

President, N. P. McKean.
Secretary and General Manager, C. W. Scott.
Treasurer, Robert Neil.
Superintendent, Jacob Widlar.

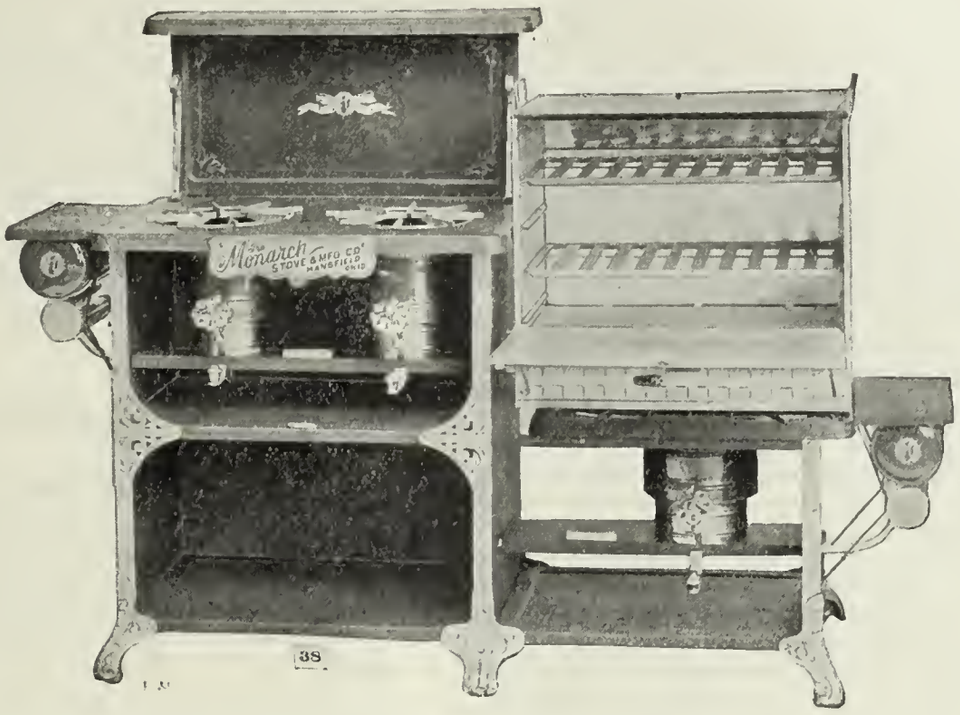
A Colebrook "Poem."

IF YOU DON'T YELL YOURSELF THERE WILL BE NO YELL FOR YOU.

"Silence is golden" may do very well
For folks who have secrets they'd rather not tell;
But if you have goods you desire to sell,
You'll find it more "golden" to stand up and yell.

We yell for Colebrook's—the best of cement.
If you're not users and will only consent,
Samples and prices to you will be sent—
Then you'll be users and we'll be content.

The above is printed at the head of a card which is being distributed by W. H. Colebrook Sons & Co., Syracuse, N. Y., in the interests of their varied line of stove and furnacemen's supplies, but particularly of their asbestos cement for stoves and furnaces.



Death of Valentine Clad.

Valentine Clad, founder of the firm of V. Clad & Sons, Incorporated, of Philadelphia, died on Tuesday, February 12, at his residence at Devon, Pa., after a short illness, of fatty degeneration of the heart, aged 75 years. Mr. Clad was born in Alsace, France, and came to this country in his early youth. In 1853 he established himself in the manufacture of French ranges, cooking apparatus, confectioners' tools, &c., a business which grew to be one of large importance, the firm's products being now in use in all parts of the country. The firm of V. Clad & Sons was formed in 1892, and incorporated in 1896. Mr. Clad took an active part in the business up to a few years ago. He is survived by a widow, two daughters and four sons, three of the sons being associated with him in business. The funeral services were held on Friday at St. Monica's Roman Catholic Church, Berwyn, Pa.

THE CHESTER STOVE COMPANY, Manchester, Va., who were established in November, 1898, expect to enlarge their plant the coming spring. They do all kinds of iron foundry work, their specialty being Stoves, of which they make a full line

The Monarch Wickless Blue Flame Oil Stoves.

The trade will be interested in the Monarch wickless blue flame oil stoves for this year, made by the Monarch Stove & Mfg. Company, Mansfield, Ohio, owing to the adoption of their new "student lamp tank construction," which is said to positively prevent overflowing and insure a continuous flow of oil for the burners in exact quantity to further the best results. This special burner is said to develop a heat of great intensity. In Fig. 1 a view of the company's popular pattern stove is shown, having two top burners and a double oven burner. The construction is of the cabinet frame type, having a high shelf with a solid back protecting wall. The tanks for supplying the burners, shown at the right and left of the stove, are made of brass and the flow to the burner is governed by a direct action needle valve. This stove stands 27 inches high and has a top 25 x 17 inches. Fig. 2 shows a three-burner Low Junior, which has a top 33 x 17 inches and stands 14 inches high. The construction and equipment is substantial and complete. The stoves are provided with a high shelf and are handsomely nickel trimmed. These stoves are fully shown and illustrated in the new catalogue which the house has for distribution.

The Monarch Wickless Blue Flame Oil Stoves.—Fig. 1.—The Popular Style Monarch.

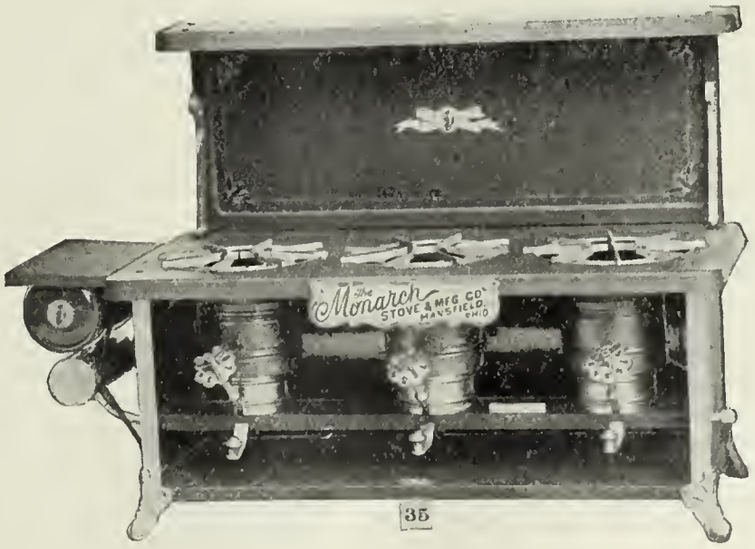


Fig. 2.—The Low Junior Monarch.

ODD PLATES.

The trade-mark of the Continental Stoves, made by the Buckwalter Stove Company, Royersford, Pa., adorns one corner of a handy desk blotter which Ed. Q. Smith is sending to the trade, so that it will not be forgotten that "Smith Sells Stoves."

W. H. Gruenhagen, St. Anthony Park, Minn., is making a specialty of the Monarch line of Gasoline and Blue Flame Oil Stoves, made by the Monarch Stove & Mfg. Company, Mansfield, Ohio, and the Eclipse line of Steel Ranges and Cook Stoves, made by the Eclipse Stove Company of the same city. He is preparing a large display room for showing these goods at the Midway Exposition, which will open in St. Anthony Park on March 1. He invites members of the Stove trade of the Northwest who attend the exposition to make a point of examining the cooking and heating goods which he will have on exhibition.

The Wireton Heating Company, Blue Island, Ill., manufacturers of Quaker, Panama, Hoffman and Farquhar Furnaces and Wireton Draft Regulators, suffered from a serious fire on the 6th inst. Their buildings were almost completely destroyed, inflicting a loss of $50,000, covered by insurance to about half that amount. The company have been building up an excellent trade and the fire comes at a most inopportune time, as it interferes so decidedly with the regular prosecution of their business. Those interested in the company are not dismayed by their misfortune, but as speedily as possible after the insurance is adjusted will proceed to rebuild, and it is their determination to provide better facilities in every respect than the old establishment possessed. They hope to get the new works in operation within 90 days at the outside.

The Excelsior Steel Furnace Company, Chicago, have secured control of the Orelup patents on Hot Air Radiators and Hot Water Boilers and expect to make these goods as soon as the necessary arrangements can be completed. The Boilers are designed chiefly for furnishing hot water supply for city apartments, for which there is a large demand.

The plants of the Springfield Foundry Company and the Progress Stove & Furnace Company, at Springfield, Ohio, were destroyed on Monday by a fire which visited the big East street shops, built by William N. Whitely, the reaper manufacturer, and which are said to be the largest shops of their kind in the country. Both concerns were located in them. The Springfield Foundry Company's loss is estimated at $100,000 and that of the Progress Stove & Furnace Company at $30,000, which losses are partly covered by insurance.

The Gurney Foundry Company, Limited, Toronto, Canada, are sending out through the mails a large sized postal card advising the trade that they have illustrated catalogues of their extensive line of Heating and Cooking Apparatus which they will be glad to mail on receipt of request to any who are interested in these goods. A feature of the card is a picture in colors of a terrestrial globe, divided into four quarters, the statement being made, in explanation thereof, that the company supply goods to "the four quarters of the earth."

An ingenious bit of advertising has been adopted by A. Weiskittel & Co., Baltimore, Md., in the interest of their new Fire King Enameled Top Gas Ranges. The card presents views of two show windows; one, in which their goods are displayed, is surrounded by a throng of shoppers, while across the street is the show window of another Stove establishment, with no onlooker except the clerk.

The Tubular Heating & Ventilating Company, Philadelphia, advise us that the demand for the Forbes Furnace has been exceedingly large during the past season. The 1901 improvements to this Heater are giving unusual satisfaction to their users, particularly the ⅛-inch steel manifolds, which, they claim, will wear for a lifetime.

E. B. Colby & Co. are sending to the trade announcement that owing to the rapid growth of their business they are compelled to secure larger quarters, and have decided to locate their office at their large warehouse at Hoboken avenue and Monmouth street, Jersey City, N. J. They have fitted up offices and sample rooms, and will be in a position to give their customers improved shipping service. They expect to be in their new quarters on February 25, and will be glad to receive the trade and show them their line of goods.

The Portsmouth Stove & Range Works, Portsmouth, Ohio, are having plans drawn for a new addition to their present building.

John Bergman, president of the National Foundry & Mfg. Company of Terre Haute, Ind., is reported to be considering the establishment of a Stove foundry and manufacturing plant at South McAllister, Ind. Ter.

A picture of two bakers in bakery costume running a neck and neck race is entitled "Quick Even Bakers" on a blotter distributed by the H. Adler Company, Pittsburgh, to draw attention to these characteristics of their Acme Gas Stoves and Ovens.

Hardware Organizations.

Minnesota Retail Hardware Association.

The annual convention of the Minnesota Retail Hardware Association will be held in the Ryan Hotel Annex, St. Paul, February 26-28. Among the papers which will be read during the meeting are the following:

"Possibilities of Trade Organization," by T. T. Bacheller.

"Talk on Insurance," by C. A. Hatch.

"The Three Essentials," by P. W. Lyon, Minneapolis.

"Advertising," by M. De Motte, St. Paul.

Besides the papers there will be many other interesting features, so that a pleasant and profitable time is promised to those who attend the meeting. It is suggested that the convention will afford a vacation period at a time of the year when the merchant can leave his business under the most favorable circumstances and thus freshen up his mind for the activity consequent upon a heavy spring trade. A fare of one and a third has been secured over all railroad lines in the State, on the certificate plan. Tickets will be good three days before and three days after the convention. Further particulars in regard to the meeting may be obtained from Thomas McCracken, secretary of the association, whose address is 323 Boston Block, Minneapolis.

North Dakota Retail Hardware Association.

The North Dakota Retail Hardware Association has just issued its souvenir programme for its fifth annual meeting, to be held in Fargo on February 19 and 20. The programme is a book of nearly 200 pages and is attractively printed in two colors. It is certainly the largest and most impressive programme yet issued by a hardware association. The special feature of interest in the book is the presentation of portraits of a large number of officers and prominent members of State hardware associations throughout the country. A list of the different State retail associations is also given, together with the names of the present officers and executive committees, so that the volume is of very general interest to those who are identified with the organization movement. It is well printed on paper of excellent quality and is very creditable to the association. A full list of the legitimate hardware dealers of North Dakota is also presented, those who are members of the association being indicated by a star. An inspection of the list shows that the association embraces a great many of the merchants who are eligible for membership.

The programme of the convention shows that it will open on Wednesday forenoon, 19th inst., this session being devoted to welcoming addresses, appointment of committees, &c. In the afternoon papers will be read by H. B. Allen of Jamestown, on "Fakes and Fakirs, or Leg Pulling," and by H. F. Emery of Fargo, on "Some

Difficulties Hardware Dealers Have to Contend With." As much of this session as may be desirable will be devoted to jobbers, manufacturers and their traveling salesmen for discussion of matters of mutual interest. At the Thursday morning session the president's address and secretary's and treasurer's reports will be presented. The final session will be held on Thursday afternoon, when papers will be listened to from O. A. Gallup of Edgeley, "One Way to Compete With Supply Houses;" from James McPhail of Langdon, "Dealers' Asociations, Their Effect and What They May Accomplish," and from L. B. Hanson of Sheldon, "The Practical Hardwareman." The Question Box will be a feature of all but one session. Reduced railroad rates on the certificate plan have been arranged for, and it is hoped that a large representation of the membership will be in attendance. The official headquarters will be at the Hotel Metropole. C. N. Barnes of Grand Forks is secretary of this association.

The Indiana Retail Hardware Dealers' Association.

According to the programme of the third annual meeting of the Indiana Retail Hardware Dealers' Association, to be held at Indianapolis, February 19 and 20, headquarters at the Denison Hotel, the convention will be called to order on Wednesday morning, 19th, at 11 o'clock. At the afternoon session President W. P. Lewis will make his annual address. The remainder of this session will be given up to the reading of papers, as follows:

"Twentieth Century Conditions," T. James Fernley, secretary-treasurer of the National Hardware Association.

"Hardware Store Arrangement," J. D. Warren of the J. D. Warren Mfg. Company, Chicago.

"Window Display and Art of Selling," H. W. Beagle, Rochester, N. Y.

"Up to Date Hardware Advertising," H. P. Townley, Terre Haute, Ind.

Wednesday evening a smoker will be tendered the association. Thursday morning's session will be of an executive character, during which private association matters will be discussed. The report of Secretary-Treasurer M. L. Corey and a paper by Wm. C. Powell of Converse, on "Illegitimate Competition," will be read. The Question Box will also be dissected. At the closing session in the afternoon Chas. H. Shirley of New Orleans will present a paper entitled "Indiscriminate Selling," and reports of the Committee on Insurance and other committees will be read. M. L. Corey, Argos, Ind., is secretary of this association.

N. E. & S. Company's Enameled Steel Wares.

Referring to their new enameled steel ware catalogue No. 3, a review of which was given in *The Metal Worker* of January 18, the National Enameling & Stamping Company advise us that the list prices in the same are in accordance with the change which went into effect on November 1, 1901. The catalogue, they say, contains practically no alterations in the style of their enameled goods, which are well known throughout the country. The three distinct brands of one-coated ware manufactured by the company are turned out at the following factories: National enameled steel ware, at New York; Greystone enameled steel ware, at Baltimore, Md., and Royal enameled steel ware, at Granite City, Ill. The last named factory also makes the patent genuine granite steel ware, a two-coated gray enameled ware of established reputation.

A line of white and white enameled ware is made at their factory at Portland, Conn., and there, as well as at the factory at Milwaukee, they turn out their green and blue mottled white lined ware, which has been placed on the market under the name of Venetian enameled steel ware. The company say that this style of ware is daily gaining in popular favor, and their constant aim is to improve the same, in order to make it the best line of enameled steel ware on the market.

AMERICAN ENAMELED WARE IN ENGLAND.

Our London correspondent writes as follows:

A. S. King, the British manager of the National Enameling & Stamping Company, has just returned from visiting his principals in the United States. After 12 months' experiment he is unusually hopeful of building up a big business in stamped ware and enameled goods in this country. He tells me that hitherto his chief difficulty has been to compete with the cheaper, unselected qualities of German enameled ware in white white and blue white. In grays he practically has no competitors, but his difficulty is to persuade the British buyer that for all practical purposes gray is superior to either of the other colors. The fixed rule of his company only to export selected qualities makes his initial efforts much more difficult, but immediately the reputation of his goods is established trade will be easier. Among some recent valuable contracts he has secured is one for a large number of milk cans for the Dairy Supply Company of this country. These milk cans, from the point of view of simplicity, strength and safety, are a distinct advance upon anything yet in the English market. A. S. King starts the coming year with hopeful prospects.

The dangers of cheap enameled ware are gradually being brought home to the British consumer. Appendicitis is now becoming far too prevalent, and it is alleged in certain quarters that this is due to the increasing use of cheap enameled iron saucepans and other enameled goods. Large quantities of these cheap articles are bought at what are called the "Sixpenny-halfpenny Bazaars," and are undoubtedly rubbish. R. H. Smith, the secretary of the Ironmongers' Federated Association, who claims to be something of an analytical chemist, has recently made some tests on four enameled saucepans. The first he purchased at a "Sixpenny-halfpenny Bazaar," the second was given away with a ¼ pound of tea for 7½ pence, the third and fourth were purchased from ordinary ironmongers and manufactured in Great Britain. A liter of distilled water was boiled down in each saucepan to an egg cupful, the remaining liquid transferred to a platinum crucible, evaporated to dryness, weighed and analyzed. It was found that No. 1 sample contained 12.4 grains per gallon of solid residual matter, and No. 2, 79.36 grains per gallon. The boilings from the British made saucepans yielded no residue. The percentage proportion of the two cheap saucepans worked out as follows:

	No. 1. Per cent.	No. 2. Per cent.
Silica	48.20	58.70
Lead oxide	36.84	Nil.
Tin oxide	Nil.	5.57
Soda and lime	14.96	35.73

The enamel on No. 2 sample, although not in itself bad, was so ineffectively laid on that, after the first boiling, quantities of it were detached in the form of sharp particles. It may be within the recollection of your readers that 12 months ago I reported an interview with a British merchant who desired to be put in touch with American enameled ware manufacturers. He received a number of replies, but in every case the price was too dear and the quality too good. After this it may perhaps be found that the recognized high quality of American enameled ware should make it a better marketable article.

THE French Vice-Consul at Rangoon, Burmah, advises his Government that French Refrigerators would sell very well in that country. He recommends to the manufacturers of such goods, however, that they should take into consideration the great heat and moisture prevalent in Burmah. He also points out the necessity of placing all the feet of every kind of furniture containing viands in basins of water, in order to protect them against the attacks of ants, which makes it indispensable that the feet of all Refrigerators should be at least 6 inches high. They should be made of hard wood, capable of withstanding the action of water. It is probable that a market might also be found in Burmah for American Refrigerators.

The Automatic Wringer.

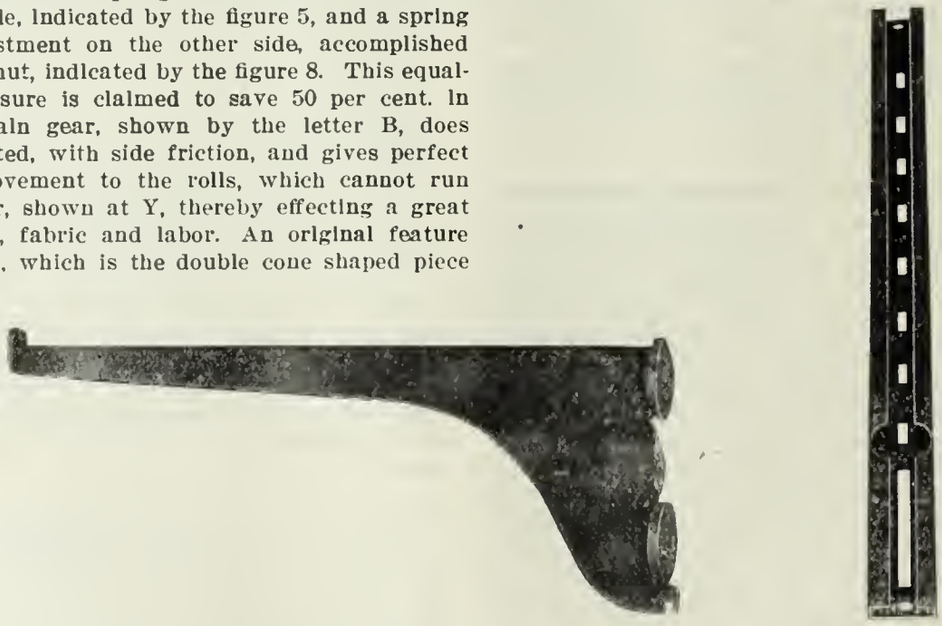
The Automatic wringer, herewith illustrated, is manufactured by the Automatic Wringer Company, Muskegon Heights, Mich. The wringer is so constructed that the full width of the rolls is utilized in wringing clothes, and the pressure at all times is equalized. It is explained that without changing the adjustment the

The Automatic Wringer.

wringer can be used with equal efficiency on a handkerchief or a bed quilt, the adjustment being perfectly automatic. The capacity without changing the wheel screw, indicated by letters X Z, is claimed to be four times that of ordinary wringers, and if necessary can be increased indefinitely. The roll pressure is equalized by a horizontal coiled spring, which has a compound lever on one side, indicated by the figure 5, and a spring tension readjustment on the other side, accomplished by an eye bolt nut, indicated by the figure 8. This equalization of pressure is claimed to save 50 per cent. in labor. The chain gear, shown by the letter B, does away, it is stated, with side friction, and gives perfect freedom of movement to the rolls, which cannot run out of the gear, shown at Y, thereby effecting a great saving of rolls, fabric and labor. An original feature is the spreader, which is the double cone shaped piece having channels running from the center, shown just in front of the lower roll. Owing to its peculiar shape, this spreads the clothes evenly along the rolls and thus causes the fabric to feed without friction. The crank handle used with the machine is a dovetailed malleable casting, which, it is remarked, will not break, wabble, wear out or need bushing. The rolls are constructed of solid rubber, vulcanized on a cold rolled steel shaft, and are made of a special grade of rubber to secure elasticity, resiliency and firmness.

The Newire Corkscrew.

The Rockwell Clough Company, Alton, N. H., are putting on the market a corkscrew, as shown in the accompanying illustration. A novel feature of the corkscrew, it is remarked, is the use of a shoulder placed at a distance from the point which is sufficiently great to allow the drawing of the longest cork and at the same time prevent the screw sinking into the cork up to the handle. The tool is made of strong wire and has



The Newire Corkscrew.

a wood handle firmly attached. The manufacturers state that the style of corkscrew shown represents the maximum of utility at a cost of one-half that of the poorest article of the kind imported.

The Wisconsin Adjustable Bracket.

The Wisconsin Iron & Wire Works, 186 to 190 East Water street, Milwaukee, Wis., have just added an adjustable bracket to their line of hardware specialties, which is herewith illustrated. The bracket consists of two parts. The slide is permanently attached to the wall, and the bracket can then be slipped into place at the bottom and pushed up until the desired position is reached, when the projection at the bottom of the bracket will slip into a hole in the slide and be firmly retained in position. The bracket is made in lengths of 8 to 18 inches, and finished in enamel, nickel or copper plate.

The Wisconsin Adjustable Bracket.

THE WISCONSIN RETAIL HARDWARE ASSOCIATION.

The largest convention in the history of the Wisconsin Retail Hardware Association was the sixth annual meeting, held at the Republican House, Milwaukee, on the 5th and 6th inst. A very large attendance was registered. The first session was held on Wednesday afternoon. After the roll call, to which over 100 members responded, and the reading of the minutes of the last annual meeting, President John Hessel of Antigo read his address.

The following committees were appointed:

TRANSPORTATION: Arthur Heins, Tigertown; C. A. Peck, Berlin.
RESOLUTIONS: A. H. Sheldon, Janesville; Andrew Noll, Chilton.
GRIEVANCES: R. W. French, Ashland; R. W. Puchner, Edgar.
RECEPTION: A. D. Race, Depere; August Schupinsky, Milwaukee.
LEGISLATION: Emil Tietgen, Manitowoc; Robert Suettinger, Two Rivers.
AUDITING: O. P. Schlafer, Appleton; E. H. Ramm, New London.
QUESTION BOX: Harry Krueger, Neenah; John Hughes, Fond du Lac; Ralph Burtis, Oshkosh; C. A. Dewey, Kenosha.
PRESS: L. Findersen, Green Bay; Ralph Burtis, Oshkosh; Geo. W. Cope.

Secretary C. A. Peck of Berlin then read his report, and the report of the treasurer, John Leverenz, was also read, showing a balance on hand of $1078.15. The report of the Committee on Revision of the Constitution was then presented by Vice-President O. P. Schlafer of Appleton, and the revised constitution was adopted section by section. An important change in the new constitution is the consolidation of the offices of secretary and treasurer. Another change permanently provides for the holding of the annual meeting at Milwaukee.

QUESTION BOX.

The next feature was the opening of the Question Box, when the following, among other subjects, were discussed:

Is it advisable in towns of l ss than 1000 population to push the sale of hot air furnaces instead of heating stoves?

The advice given by those who had experience was that if a merchant does not have in his employ a first-class tinner who can put in a furnace, he is better off without the furnace business. A ripple of laughter was caused by a member who stated that in handling furnaces "You get old stoves for your profit."

How can we best get our sons interested in the hardware business with us?

This brought out interesting statements by Mr. Peck and Mr. Schlafer. Mr. Peck interested his sons by making them partners and finds that they are as full of good ideas as himself. Mr. Schlafer has given his son a department in his store, which he manages outside of school hours and is making it a success.

What size of squaring machine is best to buy for a country shop?

It was quite unanimously decided that not less than 30 inches is the proper size.

Why are retailers pledged to carry freight on stoves until the invoices are paid?

This question was explained as relating to cases in which manufacturers assume freight. It was answered that freight is cash and must be paid. Those who buy on credit cannot expect manufacturers to pay their freight. In such cases a cash discount is deducted from the full amount, not deducting the freight.

How can you tell how much you make each day as a merchant?

Mr. Peck explained his method. He keeps a cash book and puts down every sale, at the same time putting down the cost in another column. At night the difference between the two columns shows the profit. This is open to the criticism that clerks of course must know what the goods cost.

ELECTION OF OFFICERS.

The first business taken up on Thursday morning was the election of officers. No Committee on Nominations had been appointed, as it was decided better to make nominations from the floor. Practically no contest was made for any of the offices, a single ballot serving to record the will of the convention. The following list shows the result of the election:

President, O. P. Schlafer, Appleton.
Vice-President, Leonard Findeisen, Green Bay.
Secretary-Treasurer, C. A. Peck, Berlin.
Executive Committee: J. Kornely, Milwaukee, and E. H. Ramm, New London, each for two years; Andrew Noll, Chilton, and H. L. McNamara, Janesville, each for one year.

QUESTION BOX AGAIN.

The Question Box discussion was resumed with the following:

How can we protect our interests against employees not true to our interests?

This question was explained as referring to mechanics employed in members' workshops and not to their clerks. The point was brought out that in busy seasons workmen often become unreasonable and difficult to manage, knowing that if discharged they can readily secure employment in another shop in the same line. It was suggested that the members endeavor to advise each other with regard to employees of this character.

Do you pay for goods that come damaged and you do not accept?

Several gave their experience in cases of this kind, and it was developed that the usual method of procedure is to notify the local agent of the railroad company regarding the damage done, making a claim for the amount involved, but meanwhile paying for the goods, unless it is clearly demonstrated that the damage was the fault of the packer, in which case payment is refused. Most of the members discussing this point stated that they open a regular account with their railroad company, charging the company for damages and crediting them for reimbursements. This discussion ran into a broad discussion of stove repairs broken or lost in transit, and the question of how to handle such repairs to the best advantage in keeping track of them.

What is the best way to mark the cost of goods? Do you add selling expense, and if so, what percentage of cost?

President Schlafer stated that he added freight on heavy or bulky goods, such as nails, &c., but not on light goods, and made no allowance for the cash discount, as that was presumed to cover a portion of the cost of receiving and placing them in stock. No selling expense was added in putting down this cost.

Ought the retailers buy goods of the jobber or manufacturer who also drums the local retail trade?

This brought out a very general answer in the negative.

M. L. Corey of Argos, Ind., secretary of the National Hardware Dealers' Association, strongly urged the Wisconsin Association to take an active part in the affairs of the National body. On motion a standing vote was taken on the question of joining the National Association, which resulted unanimously in favor of such action. President Schlafer then thanked the association for the honor conferred on him by electing him as president, and pledged his best endeavors to advance the objects for which the association stood.

THURSDAY AFTERNOON.

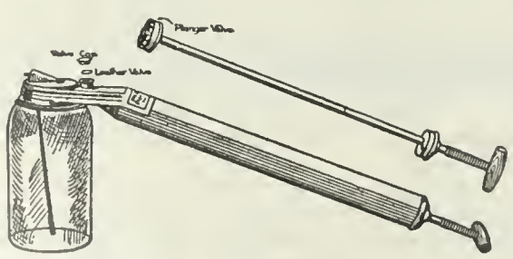
On Thursday afternoon H. L. McNamara of Janesville read an interesting paper on "The Relations of Traveling Men to Retailers." Subsequently the questions of "The Desirability to Retailers to Have Wholesale Houses Not Acknowledge Payments by Their Customers," "Department Stores" and "Gasoline Lamps for Lighting Stores" were discussed. Secretary Peck read a paper by H. C. Scofield of Sturgeon Bay on "The Care and Management of a Display of Retail Hardware." A vote of thanks for their papers was given to Messrs. Scofield and McNamara, and also to the retiring officers.

The members of the association were very agreeably entertained by the Milwaukee jobbers and manufacturers, including the National Enameling & Stamping Company, J. P. Lindemann & Sons, Speich Stove Repair Company, Boehm Stove Repair Company, John Pritzlaff Hardware Company, Fuller & Warren Stove Company, Gueder & Paeschke Mfg. Company and A. J. Lindemann & Hoverson Company.

Among the souvenirs distributed was a nickel plated match box from the Estate of P. D. Beckwith of Dowagiac, Mich.; a thermometer by the Brand Stove Company and a celluloid grip tag by the L. J. Mueller Furnace Company.

The Royal Vegetable Masher.

The accompanying illustration represents a vegetable masher offered to the trade by William G. Browne, Kingston, N. Y., and shows the bottom of the masher blade. This is formed from a single piece of sheet metal, perforated and so bent as to leave downward projecting cutting edges which hold the vegetables in place while being cut, and at the same time force them through the narrow openings. The masher has all metal parts tinned, and is provided with an enameled handle.



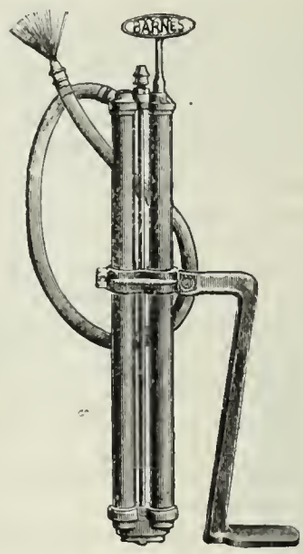
The Royal Vegetable Masher.

It is referred to as one which can be sold cheaply, as strong and easily cleaned, and as leaving the potato light, fluffy and free from lumps.

Rippley's Compressed Air Glass Jar Hand Sprayer.

The cut shown herewith represents a glass jar hand sprayer, improved for 1902, and offered to the trade by the Rippley Hardware Company, Grafton, Ill. The operation of the sprayer is described as follows: The air is forced into the reservoir by pumping, in the same way as with any sprayer. The reservoir has a brass discharge tube extending to the bottom and an air tube at the top, which allows the air to blow the solution out in the form of a continuous fog mist on all parts of the

Rippley's Compressed Air Glass Jar Hand Sprayer.



foliage. It is stated that it will spray in any position, including overhead. One filling of a 1-quart jar, it is explained, will spray 500 hills of potatoes, thus saving half of the usual time and labor. A 1 or 2 quart Mason glass jar will fit the sprayer. It is pointed out that nothing but the best material is used in the construction of the sprayer, and that leather washers are used on the jar, which are the best for use when spraying oily solutions.

Doorenbos Gas Arc Lamp.

The Sanitary Specialty Mfg. Company, 26 Milwaukee avenue, Chicago, are sole sales agents for the Doorenbos gas arc lamp, on which a patent was recently granted and which has therefore just been placed on the market. This is not a vapor lamp, but one adapted for the use of ordinary city gas, and is constructed on a principle which enables a much more brilliant light to be secured than by the ordinary methods. It competes with electric arc lights and is less expensive. It is made with one powerful central Bunsen burner, supplying a number of different mantles. This is stated to effect a saving of about one-third the gas required by a lamp having an individual Bunsen burner underneath each mantle. The lamp is made with an automatic inextinguishable pilot light. It is instantly lighted by pulling a chain and is extinguished in the same manner. This avoids the jarring of the mantles or the breaking of the chimneys whenever it is lighted. A guide prevents the mantels from being broken in removing or replacing the glass globe which incloses them. The exposed metal parts are highly finished and nickel plated, making this a very attractive lamp. It is especially adapted for lighting large rooms and stores.

Brass Bucket Spraying Pump, Fig. 254.

The accompanying cut represents a brass bucket spraying pump, Fig. 254, with malleable iron foot rest, offered by the Barnes Mfg. Company, Mansfield, Ohio. The pump is made of brass tubing without threads on either end, being held firmly together by a galvanized steel rod connected at the top and bottom parts, to make it perfectly tight. By removing the brass hexagon nut at the top of the rod the pump can be taken entirely

Brass Bucket Spraying Pump, Fig. 254.

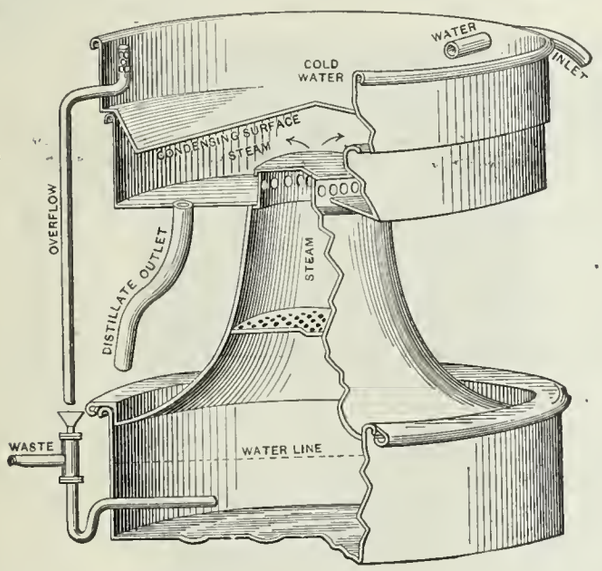
apart, should it be necessary to repair or clean it. The manufacturers refer to the advantages in taking this pump apart, over pumps made of brazed tubing, with threads cut on the ends, to be screwed into the top and bottom castings. Another pump, catalogued Fig. 255, is the same as the one here described, except that it has a bucket clamp instead of the foot rest.

The annual convention of the Illinois Retail Hardware Dealers' Association was held on Wednesday and Thursday, February 12 and 13, at Decatur, Ill., with a large attendance.

The Central Hardware Company of Waco, Texas, have been incorporated, with a capital stock of $20,000, by L. F. Woody, B. F. Quicksail, R. P. Goodman and others. They will conduct a retail Hardware, Stove and Tinware business.

Leo Schlesinger & Co. have leased for a term of years a block on the east side of Gouverneur slip, between South and Front streets, New York City, now occupied by a group of five-story buildings. These buildings will be remodeled into a large Tinware factory.

"Underwriting" Profits.



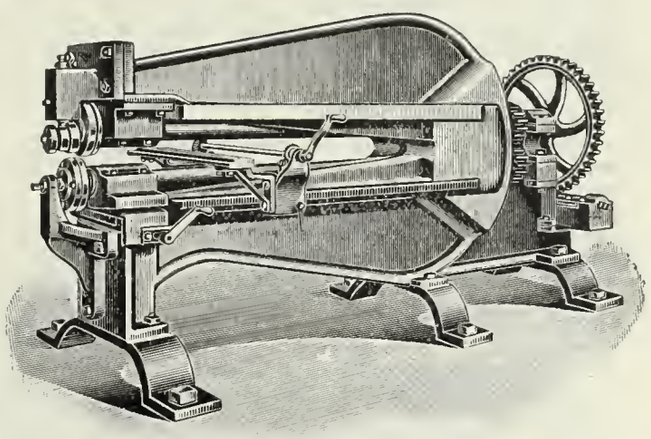
A good deal of figuring has been indulged in since the issue of the report of the United States Steel Corporation to get approximately at the profits which the Morgan syndicate must have realized for "underwriting" the steel merger. The basis of these calculations is the fact as announced that the syndicate received 649,987 shares of preferred stock and 649,988 shares of common stock of the Corporation. The usual valuation taken is 90 for the preferred and 40 for the common stock, or say $84,500,000, which is probably high. This high valuation is partially balanced by the fact that the syndicate received the dividends on such stock as it happened to hold at the time. The syndicate underwrote $200,000,000, but only $25,000,000 was paid in, no other calls having been made. The syndicate paid to the Corporation $25,000,000 in cash, and it is estimated that the other expenses were $3,000,000. This would bear a net profit of over $56,500,000. The *Evening Post* says:

Against this net profit, accruing to the syndicate, J. P. Morgan & Co. are understood to make a charge of 20 per cent. for their services as managers of the syndicate, or $11,300,000, leaving $45,000,000 as the apparent divisible profit to the syndicate, and J. P. Morgan & Co. were, of course, the largest individual subscribers.

In Wall Street the profits of an underwriting syndicate are usually reckoned on the total sum for which the members are liable. Thus, the steel syndicate profits are, roughly, 22½ per cent. on the subscription of $200,000,000. On the amount paid in the profit is 180 per cent. Probably J. P. Morgan & Co., assuming that they subscribed $50,000,000 to the syndicate, made a profit of $25,000,000 on the Steel Trust underwriting. The bankers' syndicate which underwrote the steel issues will, in short, clear the largest profit ever made on an undertaking of that kind in this country.

The McKenna Automatic Water Still.

The automatic water still designed and manufactured by the McKenna Bros. Brass Company of Pittsburgh is intended for use in chemical laboratories, and also for furnishing pure water for domestic use. The



The McKenna Automatic Water Still.

construction of the still will be understood from the engraving, in which a part has been broken away to show the interior. To operate the still, it is placed on a tripod over a Bunsen burner or other suitable source of heat. The water inlet in the top pan is connected by rubber tubing to the water supply and water allowed to run in continuously. When the water reaches the level of the holes in the overflow pipe it runs into the funnel shown at the side and then into the lower pan until this is filled to the level of the small waste pipe shown at the side of the tee. The waste cannot rise higher than this level in the lower pan, since the excess of water is carried off by the waste pipe, which is connected by rubber tubing to the sink. When the gas is lighted steam is formed in the lower pan and rises through the central throat into the condensing chamber, passing through the baffle plate shown in the lower part of the throat and entering the condensing chamber through a ring of small holes about ½ inch above the bottom of the condensing chamber. The steam, striking on the upper surface of the chamber, which is kept cool by the running water, is instantly condensed, and drops to the bottom of the chamber as chemically pure water, whence it runs out through the distillate outlet, which is made of block tin pipe, into a suitable receptacle. As the water boils away from the lower pan, it is automatically replenished, so that the level is kept at the same point and no attention is required.

The still is 11 inches in diameter and 13 inches high. Over a burner using 10 cubic feet of gas an hour it will deliver 3 quarts an hour. It is made of heavy copper spun into shape with no soldered seams. All parts of the still are easily accessible for examination; by lifting off the top pan and then the condensing chamber, which is made in one piece with the central throat, every part of the still is in plain view.

The Ham Rotary Shears.

The rotary shearing machine built by L. M. Ham & Co. of Boston will cut, centrally, wrought iron or steel sheets 10 feet wide, up to ½ inch thick. The cutters are

The Ham Rotary Shears.

so supported on their shafts as to withstand the heaviest strain, and yet they may be readily removed for sharpening. They are vertically adjustable to act on varying thicknesses of metal, and means are provided for resisting the endwise thrust of the shafts tending to separate the cutters laterally. The machine has an adjustable gauge for regulating the width of the strip cut from the plate, and also an attachment for preventing the plate from being tipped up by the cutting pressure or retarded in its movement through the cutters. Power is applied through a worm gear and suitable reducing gears.

Dr. S. Rideal, in a paper read before the British Association at Glasgow, Scotland, put forth the statement that, when properly employed, sulphuric acid is a sure antidote to typhoid fever. During last year's alarming outbreak of enteric fever among the British troops in South Africa Dr. Parker of Chelsea, London, and himself began to make experiments, with a view of finding some chemical salt which would kill the typhoid germs in the infected water, and could also be added to that water by the soldier on the march. Such a salt they claim to have discovered in acid sulphate of soda, which, when added in the proportion of 1 gram (15 grains) to the pint, completely sterilized the water in a quarter of an hour. It was also found out that sulphuric acid added in the proportion of 4 grams to the gallon rendered sewage or drainage waters from isolation hospitals free from the typhoid organism.

THE PLUMBING BUSINESS—SOME SUGGESTIONS AND CRITICISMS.*

As manager of water works properties and also as owner of plumbing and heating business I have had 12 years' experience with master plumbers and journeymen plumbers. You may consider my remarks unbecoming to one who is actively engaged in the plumbing and heating business, but I hold that it is proper for us to criticise the manner and method of conducting this business.

I have heard the plumber accused of a peculiar pedigree—namely, sired by a natioual association and damned by the suffering public—yet I kuow that under the most favorable conditions our business is a difficult undertakiug. When you compare the many who fail to the few who succeed it reqnires nerve to place your money in this business. It is enough to make one serious to see man after man lose his last dollar while apparently laboriug hard to win out. Trying to analyze the cause of so many failures has given me materlal for my remarks.

A day does not pass without your ear being tickled with some remark about the immeuse profits of the plumber, but as I face an association comprising 95 per cent. of the master plumbers of Kansas I see no diamonds upon your honest breasts. Few of us own tbe place of busiuess we occupy or the house in which we live; many of us do business upon borrowed capital. When we realize what a small amount of money actually sticks to our fingers, although large sums are handled by us, there must certainly be something wrong, and I have come to the conclusion that it proves a lack of busluess ability.

I sometimes think we have been bypnotized by the oft repeated accusation of making a large percentage and actually lose sight of the principal. A man cannot succeed at this business unless it is conducted upon busluess principles. I can show you plumbing shops that look like opium deus and plumbers' books that look like a Chinese laundryman's accounts. Such combinations cannot win iu this business. When a man seeks a plumber he does not want to be required to go into a second-hand joint or junk shop. Do not reqnire your customers to don jumpers and overalls to protect their clothing wheu they come to your place of business.

The display room of a plumbing shop should be as neat as a dry goods store. You cannot make prospective customers believe that you can sell cheap because your goods are dusty aud fly specked and your windows and ceilings are cloudy. On the contrary, such an appearance is properly construed to mean old fashioned, uu sanitary fixtures. We can profit much by observing how other lines of business are conducted. If it pays the clothlug merchaut to dress his windows it will also pay the plumber. It does not make any difference how small the shop may be or limited the capital, it is a good investment to always keep a tidy place. Some master plumbers seem afraid to own the goods they are offering for sale; at least they do not have confidence enough to invest in a creditable display of stock.

The day of hunting up a customer with a catalogue and trying to sell plumbing fixtures by showing pictnres is past. The man who can show the goods aud thereby prove his ability to complete a contract within a specified time will get the good cash business. It is always a safe investment to have the fixtures for a complete bathroom on display, and it is as essential as the sign over your door. The more complete and diversified the stock the greater the opportunity for making sales and securing contracts. It is well to remember that loss and shrinkage in value is only to be found in cheap stuff. Ask your customer to come to see your display, and the best way to do so is through the newspapers. A man, if not ashamed of his business, should give public notice of where he can be found and what he is doing. If yon put in a good bathroom your customer will have no objection if you give publicity to the matter through the newspapers. In fact, he will be pleased to learn that you are informing his friends of the fact that he has modern plumbing in his home.

Master plumbers often make a mistake in being careless in keeping tbeir books and accounts. If you cannot do the book work promptly and properly it will prove a good investment to employ a competent bookkeeper. A good acquisition to any plumbing shop is a girl with a typewriter; it insnres legible letters, intelligent accounts and a neat office. It also tempers the wrath and subdues the profanity of your irate customer when he calls to settle his bill.

It never pays to send out a crude statement. The customer is liable to jump at the conclusion that the material and labor furnished him were on the same order. The plumber should mail his customer a statement the moment the work is completed, whether it is contract or jobbing work. It is business, he is entitled to it, and when you call to see him the first of the month he canuot plead that he has not had an opportunity to check it over. Try this plan and see if payments are not made more promptly. The jobbing house and manufacturer mail you a statement immediately upon the shipment of your order, and it is only business for the plumber to do the same.

We must understand once for all that old methods are obsolete. Master plumbers must adjust themselves to changed conditions. Business must be done on a closer margin and profits must depend upon the volume of busiuess done. Let us get in line with the times and modern, up to date methods. Master plumbers must take more pride iu their business. They must identify themselves witb the welfare of their city. They should belong to commercial organizations and contribute time, ability and money toward advancing the interests of their city, and the knowledge, experience and acquaintance thus gained will return liberal dividends. The master plumber should so interest himself in the upbuilding of his city that he will be recognized as engaged in an honorable and creditable business. To be engaged in this business does not absolve a man from the duty he owes as a good citizen of contributing his share toward upbuilding his city or participatiug with political, benevoleut and charitable associations for the betterment of his fellow man. A plumber has no right to be a hanger ou. He should work for and advocate those thiugs that will make his city more prosperous and a better place in which to live.

Let us practice what we teach by equipping our homes with modern sanitary fixtures. The master plumber who has no bathtub in his home or does not use a bathtub frequently should not be permitted to sell sanitary fixtures.

In conclusion I desire to congratulate the plumbers of Kansas upon the many signs of improvement in our busiuess that can be seen throughout the State. The general prosperity of the State has been felt by us, but how much of our success is due to the vigilant work of our officers, who, backed by nearly every plumber in Kansas, have been able to protect our rights and interests. Let us renew our pledge to stand firmly by the regulations of our associatiou and comply strictly and honorably with its reqnirements and obligations.

*Paper read by John Bishop at the Convention of the Kansas Master Plumbers' Association.

ARRANGEMENT OF SUPPLY PIPES OVER SINKS.

BY HELMAR.

Considerable skill is often necessary to arrauge sink supplies and air chambers so as to get the best results, because no place in the ordinary job is better for the stop and waste cocks which control the bathroom supplies

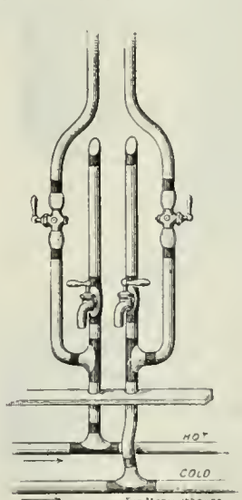


Fig. 1.— Faucets and Air Chambers on Direct Supply Pipe.

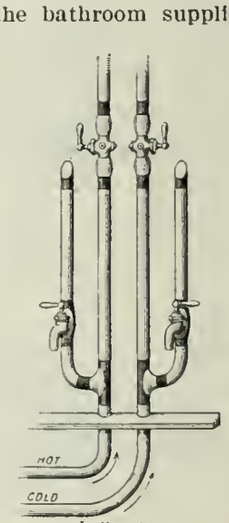

Fig. 2.—Faucets and Air Chambers on Branches.

Arrangement of Supply Pipes Over Sinks.

thau over the sink. Three plans are shown in the accompauying sketches, each of which has its merits. The cold faucets should always be on the right-hand side. The hot supply should always be the upper pipe of the horizontal "runs." When there is uo circulating pipe, if the sink is only moderate size and the pressure uot extra high, the faucets should be placed ou the direct lines.

as shown in Fig. 1, have good air chambers, and the bath room branches taken out on the outside. This throws the concussion directly on the air chambers at the two faucets most used. Furthermore, the faucets are close enough together to let both flow into a small vessel at once.

If the pressure is extremely high place the sink faucets on branch pipes taken out inside the direct lines, or outside, as shown by Fig. 2, as conditions may require. When on the outside faucets are too far apart to draw

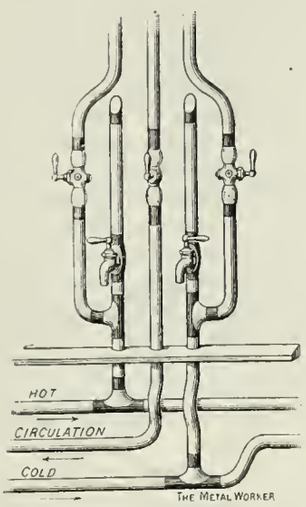

Fig. 3.—Faucets and Air Chambers as Arranged on a Circulating System.

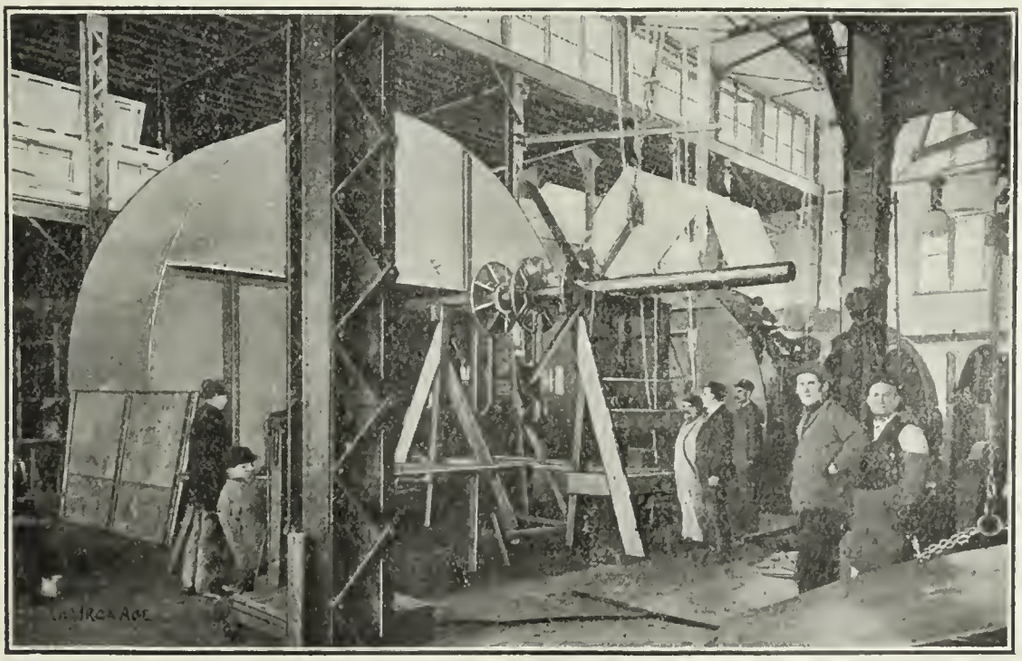
from both at once into any but a large vessel, but the direct lines are free, and a filter may be very easily branched into the cold supply pipe, between them, over the sink, at any time, at the least possible expense. All other faucets must be well provided with air chambers when the sink faucets are on branch pipes, especially on extra high pressure work.

A circulating job requires three lines, and the circulating pipe is almost without exception carried between the hot and cold lines, thus bringing its stop and waste and the one on the hot supply side by side. Both these stops must always be turned at the same time, both waste, and they should be together so that neither will be forgotten. The sink faucets of circulation jobs are nearly always placed on the direct lines, as shown in Fig. 3, and should have extra long air chambers if the pressure is high. They may be placed on branch pipes, but this throws the direct lines very far apart, and the branch pipes for them must be taken out on the inside to avoid having the faucets even further apart than when they are on branch pipes taken from the outside of the lines of a plain job. Bulb air chambers are sometimes used on circulating jobs, but, as the sink in such jobs is usually large, and the chambers must go below the stop cocks, the cocks are then too high for convenience. Branch pipes may be taken out below the sink, but this takes more pipe and cuts the capping in too many places.

Large Fan for Mechanical Draft.

The American Blower Company of Detroit, Mich., recently produced a fan of unusual dimensions to be used in a mechanical draft installation. It is intended for producing forced draft in a boiler plant of 10,000 horsepower, and does away with the use of a chimney. The fan will be used in connection with Roney stokers, the fuel employed being anthracite buckwheat No. 2. It has a wheel 18 feet in diameter, inclosed in a housing constructed of steel plate and beams, standing 30 feet high. The accompanying half-tone shows this fan in course of construction in the new shop recently completed by the company for the special manufacture of this apparatus.

New York City Notes.



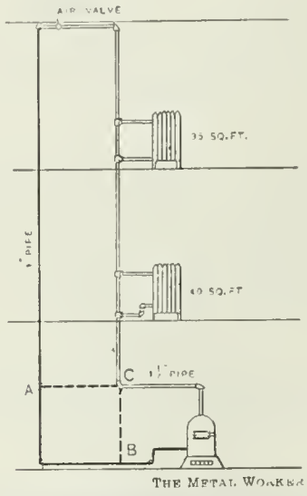
Trade still continues quiet, many journeymen being out of work. The only busy shops are mostly those with large contracts which have been going on for some time.

* * *

Charles Hensle seems to have the knack of keeping busy on fine work. His latest job is a row of houses for Sonn Bros., at 306 to 314 West Ninety-ninth street, which work is ready to go in on at once. He also has jobs at Ninety-fourth and Ninety-seventh streets, near Riverside Drive, which are not yet ready.

* * *

The differences existing between the Amalgamated Society and the United Brotherhood of Journeymen Plumbers and Gas Fitters seem now to be on a good road to settlement by the two organizations uniting as Local No. 2. A probable agreement with the Masters' Association will be one of the results accomplished, together with doing away with strikes, entailing loss of time and money, such as have occurred during the past three years.



Large Fan for Mechanical Draft.

T. W. Corbett, New Haven, Conn., is heating and plumbing the new parish house of Christ Church, in that city.

WHY THE BOILER WAS CONDEMNED.

BY MANUFACTURER.

A few months ago I read an article in *The Metal Worker* in reference to faults in boilers that were brought to the attention of manufacturers. An experience of this kind having just come under my notice, I think that some interest might be taken in a brief account of it. A small heater of the type known as tank heater was sold to a customer, and in a few weeks the complaint was registered that the boiler was no good and would not heat. No satisfaction could be secured from questioning the customer on the details of piping, &c., and it was necessary to go to the expense of sending a man to see what was the trouble. On investigation he found the piping system in connection with the boiler to be as shown herewith, the boiler being used to heat two small radiators of 40 and 35 square feet of surface. A 1½-inch flow pipe was taken from the heater and carried over to a point where a riser was taken up to supply the two radiators, and then, instead of a return pipe being brought back from the two radiators and thereby saving piping and insuring satisfactory operation, the method as shown in the sketch was followed. A 1-inch pipe was carried up to the ceiling of the second floor and run over to the wall, where the 1-inch pipe

Why the Boiler Was Condemned.

dropped, behind the lath and plaster, to the cellar, where it was carried to the boiler. It is not difficult to see why the radiators would not heat, to say nothing of the foolishness of making the return smaller than the flow pipe in a hot water system.

Notwithstanding that the trouble was due to the ignorance of our customer, we were expected to devise some means of aiding him to get out of his difficulty at the lowest cost. We advised him to cut out the pipe from A to B and disconnect the pipe at C, so that the flow main could be carried from the top of the boiler over to A and connected with the 1-inch pipe. The return was then connected with the old flow riser and carried down to B. By this means hot water from the boiler flowed across the building to A, where it rose in the 1-inch pipe behind the lath and plaster to the top of the building, and, on slightly cooling, fell through the two radiators. While this remedy does not change the job from a botch, it nevertheless does enable our customer to afford a more satisfactory service to the owner of the plant. It is quite probable now that should anybody in the trade run across this piece of work they would be informed that it was designed by one of our men, so that, in addition to having one of our boilers set under a handicap so that it cannot give the owner the satisfaction that it is capable of, we also enjoy a reputation for designing a piece of work which would cause our office boy to be discharged if he was guilty of such an outrage on common sense in piping.

THE RED WING SEWER PIPE COMPANY'S old plant at Red Wing, Minn., was destroyed by fire February 7, entailing a loss of from $75,000 to $100,000, with insurance of $50,000. The loss includes valuable machinery, patterns and dies.

STEAM FITTERS' CONVENTION.

In order to get the views of the members of the National Association of Master Plumbers and Hot Water Fitters as to the time and place for holding the next annual convention, Secretary Henry B. Gombers requests members to send in their preferences. Already the Eastern members have suggested to the Executive Committee that June 3, 4 and 5 would be a convenient time, and they have also suggested Atlantic City, N. J., as a place for holding the convention. This popular seaside resort could readily accommodate a large number, and if the convention was held at that place many members would be enabled to enjoy a short sojourn on the ocean front. There has been some talk that the National Association of Master Plumbers will hold their next convention in Atlantic City, and as the time and date have not yet been set it would be of some advantage to the membership of both associations if Atlantic City should be finally decided upon and dates arranged that would not conflict. Secretary Gombers also mentions that any amendments to the constitution must be placed in the hands of the Executive Committee at least ten days before the date of the opening of the convention if action is to be taken on them, in accordance with the laws of the association.

Resolutions on Death of John D. Clarke.

At a meeting of the Master Steam and Hot Water Fitters' Association of New York City, held on Tuesday, January 28, the following resolutions were unanimously adopted by a rising vote:

Whereas, The sudden death of our fellow member, John D. Clarke, in the fifty-fifth year of his age, has taken from us a man well and favorably known in the steam heating trade, therefore be it

Resolved, That we, the members of the Master Steam and Hot Water Fitters' Association of New York City, place on record our regret over the loss which came so unexpectedly; and be it further

Resolved, That in losing him we shall miss a genial companion of many years' standing, whose fellowship was sought by many; and be it further

Resolved, That this association tender its sympathy to the family of the deceased, and that these resolutions be entered upon the minutes of the association and published in the *Official Bulletin* of the National Association.

Transmural Ventilation.

In the year 1878, says the London *Telegraph*, Dr. Flugge proved that air will go through the walls of a closed room at a rate depending mainly on difference of temperature between the inside and the outside—the latter being the lower. With walls of ordinary thickness he found that about one-fourteenth of the air in the room would be changed per degree Centigrade per hour. In other words, if the outer were 14 degrees C. colder than the inner, the air of the room would be completely changed in an hour by transpiration through the walls. M. H. Wolpert has re-examined this subject, and he finds that in a chamber of 60 cubic yards capacity, having walls of masonry covered with paper, the air will be changed at the rate of one-fortieth of its volume per degree Centigrade per hour. When the paper on the walls contained oil varnish decidedly less air permeated, while without paper at all much more went through. It is desirable, therefore, that the exterior of houses should be clean, and a heavy rain is a blessing in this respect. Also it follows that the greater the difference between inside and outside warmth the more copious this spontaneous ventilation. Pettenkofer found that when materials like slag and glass were used, through which air could not pass, the cements employed were, as a rule, highly permeable.

ASSOCIATION NEWS.

New York City Master Plumbers.

The Executive Committee of the Association of Master Plumbers of the City of New York held their annual meeting in the rooms of Manhattan Branch, on Monday, February 10. The reports of officers and committees showed a great deal of work done and good accomplished, and that the various branches composing the association were in good shape. The result of the election showed that the organization was thoroughly satisfied with its executive head, Isaac J. Brown being elected president for the third time. The other officers were mostly re-elected, the list being as follows:

President, Isaac J. Brown, Manhattan.
First Vice-President, Edward Macdonald, Brooklyn.
Second Vice-President, J. A. Rossman, Manhattan.
Treasurer, B. F. Donohoe, Manhattan.
Secretary, T. A. Hill, Manhattan.
Sergeant-at-Arms, W. M. Brown, Brooklyn.

Treasurer Donohoe holds the banner for office holding, as this is his fifth term.

Bridgeport Master Plumbers.

At the recent annual meeting of the Master Plumbers' Association of Bridgeport, Coun., the following officers were elected for the ensuing year:

President, John T. Brady.
Vice-President, F. C. Booth.
Treasurer, L. H. Mills.
Secretary, W. D. Kelsey.
Sergeant-at-Arms, H. B. Middlebrook.

St. Catharines Master Plumbers.

The master plumbers and steam fitters of St. Catharines, Ontario, Canada, met on February 3 and formed an association of master plumbers and steam fitters, which is to be affiliated with the Dominion Association of Master Plumbers. The following officers were elected for the ensuing year:

President, Albert Chatfield.
Vice-President, Andrew Riddell.
Secretary and Treasurer, Theodore Parnell.
Master-at-Arms, Charles Hoople.

The Master Plumbers' Association of Boston, Mass., gave their twentieth annual ball in Berkeley Hall last Thursday evening, there being about 400 in attendance. The Floor Committee consisted of Daniel Shannon, J. W. French and T. J. Tute. Among the guests present were Capt. John S. Damrell, Michael J. Fitzsimmons, Richard Lynch, William Donovan, Robert Godfery and James Heatherton.

The Calorific Heater & Mfg. Company.

James Walp, William A. Walp and Lewis C. Wilson of Easton, Pa., recently spent the day in Allentown, Pa., in company with S. N. Lehr and W. H. Gangawere of that city, where they purchased 4 acres of land in South Allentown for the erection of seven buildings, which will be occupied by the Calorific Heater & Mfg. Company for making the Calorific steam and hot water heaters. The machine shop is to be 50 x 140 feet, the foundry 40 x 100 feet, with suitable buildings for the cleaning and testing room, engine and boiler room, pattern storage house, coke sheds, core ovens and office. The company have been manufacturing the Calorific steam and hot water heaters for several years, and they have gained a good reputation and established a considerable demand for these goods. Heretofore the company have been hampered in the production by having their office in Easton and their manufacturing plants at Tatamy, Pa., and Phillipsburg, N. J. The new plant will enable them to produce their goods more expeditiously and economically.

Field & Shorb have the contract for heating the St. John's Episcopal Church, at Decatur, Ill.

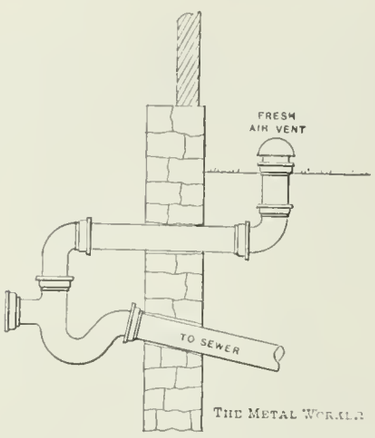
The Foster Steam Specialties.

The Foster Engineering Company, Newark, N. J., are sending out their 1902 catalogue, consisting of 96 pages, devoted to the Foster regulator or reducing valve and other high grade specialties for use in connection with steam, water, gas, or air. The catalogue is handsomely printed and illustrated with excellent half-tone engravings, the first giving a general view of their plant. A page is devoted to a view of the company's new plant, which is said to have many times greater producing capacity than their old plant. This is followed by an excellent view in the testing room. Under the head of "Facts Worth Knowing about Pressure Regulators and Kindred Devices," useful information is given in reference to the quality and character of valves which some of the great engineering plants are using, and their adaptability for compressed air plants and for shipbuilding is pointed out; also that they are the United States Navy standard. This preliminary matter, occupying several pages, closes with an invitation to write the house whenever needing information in reference to valves.

The next section is divided into 13 parts, giving information for saving time and money when ordering goods. The Foster regulator of Class W has the first place in the catalogue and is shown by means of a fine half-tone engraving and excellent sectional drawings lettered, so that the explanation in detail gives full information in reference to the construction and operation. The same general character of information and illustration is presented in the Foster improved diaphragm, strainer and toggle levers and springs. The Class Q regulator, pump governors, engine regulators, back pressure valves, relief or free exhaust valves, non-return stop valves, with angle or straight way bodies, combination steam actuated valves for emergencies, hand stop valves and pilot valves form another section of the catalogue. The Foster device for controlling the speed of pumps or engines is also shown and described. The Foster Class W regulator is also shown as a pump regulator actuated by water discharge pressure and actuated by steam and discharge pressure. This is followed by the Foster automatic pump stop and combination regulator. Foster's Excelsior valve No. 7 automatic safety stop valve, float valves, automatic belt shifter, automatic relief valve, high pressure reducing valve and the Class W pressure regulator for steam heating on frames close the line of goods shown in the catalogue. Instructions are given how to apply and use the Foster regulator, divided into 14 heads, with diagrams showing the various positions in which the valve may be set. The catalogue also contains a table of dimensions and a private code for ordering goods or repairs. This code occupies five pages and is followed by a well arranged index.

The P. and S. S. League.

The main contest in the bowling tournament of the Plumbing and Steam Supply League in New York on Monday night was in the last game between the Ronalds & Johnson Company's Brooklyn team and the team of F. N. Du Bois & Co., the latter team winning by a score of 788 to 769. They also won two games for the evening while the former team won and lost. The team of John A. Murray lost two games and completed their schedule, joining in the tail end tie with the teams of E. F. Keating and Thomas G. Knight. These three teams are waiting to welcome the team of F. Adee & Co., which has two games to bowl.



The contest of the whole tournament in which the most interest was centered took place Thursday night, when the Behrer Family team had to win two games to tie the John Simmons Company's team for first place. They also had to beat the team of the Crane Company, who also had a chance to tie the leading team. The H. P. Read Lead Works' team lost two games, the first to the team of Behrer & Co., the score being 574 to 748, and the second to the Crane Company team; score, 601 to 805. Then came the fierce strife to tie the leader. When the smoke of the fray had cleared away it was found that the Behrers had down 823 pins to 822 by

their opponents. This was a worthy contest, as both teams held their front positions through skillful, consistent bowling, and their team averages will be at the top of the list. In the last game A. Behrer, Sr., scored 185; C. Behrer, 170, and M. Behrer, 169. For the Crane Company's team C. W. Grimshaw scored 202; G. A. Van Steenburg, 172, and A. E. Good, 156. When the regular schedule is completed the tie for first place between the teams of Behrer & Co. and the John Simmons Company will be decided on the alleys, when it is safe to expect a large and enthusiastic audience.

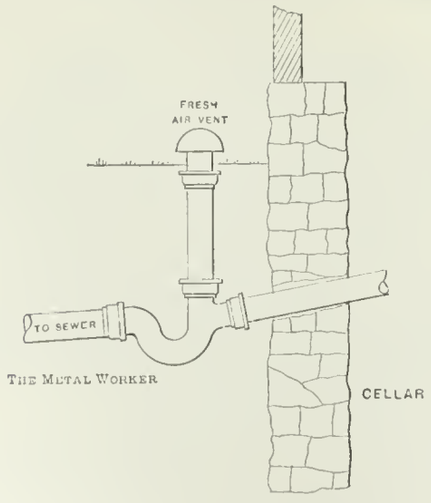
MAKING SEWER CONNECTIONS.

BY G. H. W.

The method of connecting house drains with sewers is one that has been widely discussed at different periods by those interested in the improvement of plumb-

Making Sewer Connections.—Fig. 1.—A Customary Arrangement.

ing. In this little section of Rhode Island two methods of making sewer connections are adopted. That shown in Fig. 1 follows in principle the custom which has quite generally been adopted in various parts of the country. In this instance the running or intercepting trap is placed inside of the cellar or front wall. The fresh air inlet and foul air outlet, as it should properly be called, is connected with what would ordinarily be termed the hand hole or clean out opening of the trap, and is carried to some point outside of the building, generally located at least 6 feet from any door or window. The upper end of this vent is usually protected by a cap.



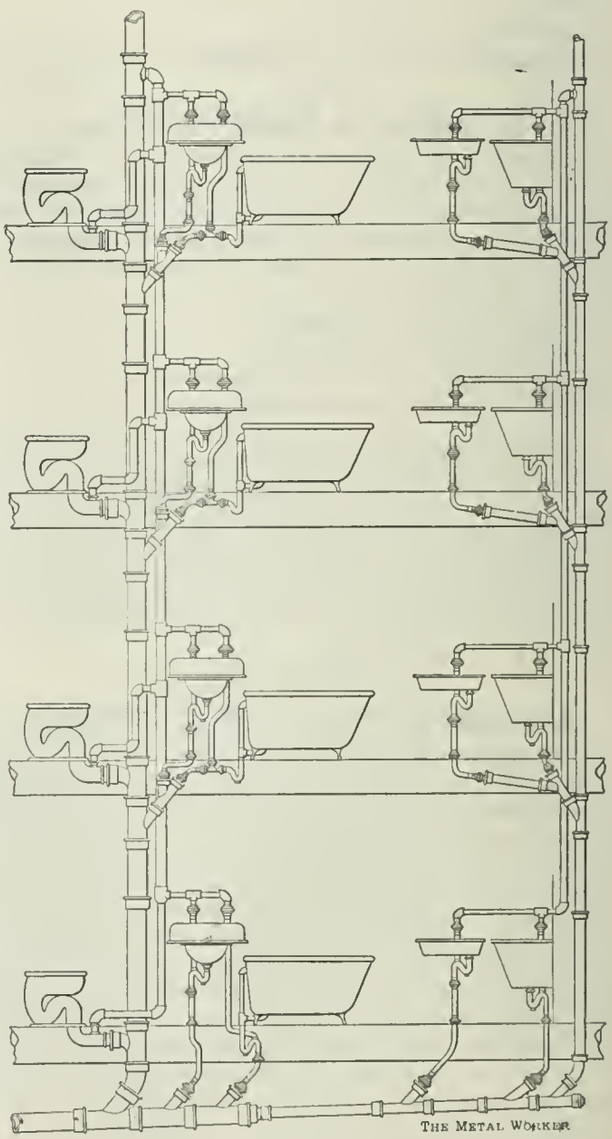


Fig. 2.—Trap Outside the Building.

A method that is sometimes used is shown in Fig. 2, where the intercepting trap is located outside of the building. The argument in favor of this location is that should the sewer air break the seal of the trap from pressure in the sewers, due to back water compressing the air in them, and bubble through the trap seal, this air could readily escape through the fresh air inlet located as shown. Of course the same may be said of the connection shown in Fig. 1, but the necessary turns in the vent pipe will not allow the sewer air to escape as readily as the direct pipe shown in Fig. 2.

I have said that this vent pipe should also be called a foul air inlet. I appreciate that under most conditions the warmth of the building is sufficient to induce an inflow of fresh air through this pipe which passes through the entire drainage system, and escapes through the vent pipes, when they are carried through the roof. There is another period of time, however, when the filthy air in the drainage system is forced out through this pipe, when a fixture is discharged, and the swirl of the water running through the vertical and horizontal waste pipes forces the air ahead of the flush and out of the pipe. This is recognized to the extent that in many cities the law provides that the outer end of this vent pipe must be so located that the odors that attend the discharge of the air from it when a fixture is flushed cannot be a nuisance, and requires that it be at some distance from a window or door.

Anderson Sanitary Couplings.

The success that has attended the use of the Anderson lead pipe coupling for street service pipe made by the Anderson Coupling Company of Portland, Conn., has led to the demand for a coupling adapted for sanitary work. In the accompanying illustration is pre-

Anderson Sanitary Couplings.

sented an elevation of a plumbing system in an apartment house in which the Anderson lead pipe coupling is used for connecting to lead piping, showing how the work may be done without the need of a wiped joint. The pipes are arranged in accordance with the most approved plumbing regulations, and show that with these

couplings, which are especially made for sanitary work, a plumbing system can be erected by any one who is familiar with the great necessity of arranging the pipes properly, so that sewer air cannot possibly find its entrance to the building, and that the waste, flushing water and condensation may find their way properly to the sewer and a circulation of air take place in the piping, to dilute or destroy what otherwise might be harmful. The company issue a catalogue showing the various styles of fittings which they manufacture for this work, and the tools for working the lead pipe so that the couplings can be used. They invite correspondence, and are prepared to render assistance to all who may desire instruction. Their little pamphlet "Don't" is devoted entirely to the coupling designed for making a street service connection.

"The Plumbing Trade Conspiracy."

The above heading, which is given to an editorial in the New York *Times*, seems to be a reflection of the view taken by the public of the efforts of the association plumber to enforce his view of trade protection. Items of news about suits of a kindred character to those referred to have been presented in the newspapers frequently; but for so prominent a paper as the *Times* to take up the subject editorially is evidence that an interest in it is being awakened on the part of the public that can result in no benefit to the trade, and which would suggest the advisability of a less radical course than that which is being pursued by plumbers in some sections of the country. The editorial in question is as follows:

The plumbers of at least two States are learning from disagreeable experience that to maintain a conspiracy in restraint of trade, with high handed rules framed to drive from the business all who do not conform to the regulations prescribed by the National Association of Master Plumbers, is dangerous even if profitable. One batch of Texas master plumbers was lately rounded up on indictments for violation of the anti-trust law involving aggregate penalties of $56,550,000, and most of them confessed judgment and withdrew from the association. It is not reported that they have yet paid the judgments. A second round up has just taken place at Austin, with a large number of defendants. The penalties claimed under the statute against 21 of them already amount to $40,950,000, and are increasing at the rate of something over $100,000 a day. The plumbing business has been understood to be profitable to those who engage in it under favorable conditions, but scarcely profitable enough to warrant the risk of such magnificent penalties as the Texas law imposes. In the first Texas case a local association was made defendant. In the suit just begun at Austin individual members are separately impleaded and stand charged with violating the anti-trust law of the State by forming and entering into a combination to restrict competition. This procedure is strictly in accordance with the decision lately handed down by Judge Morris, in the case of the State of Texas against the Shippers' Compress & Warehouse Company, to the effect that a corporation could not be held to be a violator of the law, but that each member who enters into such corporation and forms a part of it is guilty of such violation when it occurs. This would seem to be an odd ruling, but the Texas anti-trust law is an odd law, and probably the distinguished jurist whom we have quoted interprets it correctly.

In Ohio the anti-trust law has been invoked by one John A. Smith, who has instituted a suit against the Akron Master Plumbers' Association, charging that the association is organized for purposes at variance with said law and citing injuries for which he claims damages in $22,500. As the Ohio law provides that double the amount of damages proved may be collected, the defendants are really confronted with a $45,000 damage suit. The petitioner alleges that because he is not a member of the Akron Master Plumbers' Association he has been unable to buy goods from those making the kind of goods suitable for his trade, and has been put to great inconvenience and loss in consequence; and he promises to produce letters by the pound from firms who have refused his orders on the ground that they did not dare to sell him because of the threat of the association to boycott those who violated its rules. As it is on exactly these lines that the master plumbers' associations have worked, it looks as if Smith had a good case. Indeed, it is surprising that they have not before been made defendants in conspiracy suits. In no trade has the principle of the laws defining public policy in such matters been so openly defied as by the plumbers, and that retribution has overtaken them will probably not occasion widespread unhappiness outside the associations which have had things their own way for a good many years.

Heating and Plumbing Notes.

THE members of the Plumbing Board of Washington, D. C., have written to the District Commissioners, asking them to request Congress for the sum of $10,750 to pay for services rendered from July, 1893, to July, 1898. Col. John Biddell, the engineering commissioner, has submitted an adverse report on the request, stating that a former report of this board mentions that the plumbing board have received no salary, but have devoted their time and energy to the service, as a contribution to the cause of sound government and progressive sanitation.

G. H. SCHWAB, American representative of the North German Lloyd, proposes to inclose the West Thirty-forth street pier during the visit of Prince Henry of Prussia, and to equip it with a steam heating plant and an incandescent lighting system. The interior will be trimmed with flags, bunting and palms, bay and laurel trees.

THE GREASON MFG. COMPANY, 108 West Ninety-ninth street, New York, are attracting attention to their Galvanized Sheet Iron Wash Tray Covers by using them as sides on their delivery wagons, in this way bringing them to the attention of their many customers in the plumbing trade in New York City when delivering goods, besides showing them conspicuously to the public as the wagons pass through the streets.

A STRIKE in the plumbing trade at Memphis, Tenn., has resulted in the bringing in of journeymen plumbers from the outside to do work in that city.

GEORGE H. BEASLEY, North Easton, Mass., has moved his plumbing business from Beasley's Block to Washington street.

THE TIRRELL GAS MACHINE COMPANY, 39 Dey street, New York City, are finding a good demand throughout New England for their Gas Lighting Apparatus for suburban residences.

THE HARTFORD BLOWER COMPANY, Hartford, Conn., have the contract for installing a complete blower system for removing dust from the new building of the Bemis & Call Hardware & Tool Company, Springfield, Mass.

SHUMWAY & RILEY, Northampton, Mass., have the contract for the plumbing work in two brick buildings to be erected for the Florence Mfg. Company in that place.

THE HART & COOLEY COMPANY, New Britain, Conn., manufacturers of Steel Register Plates, are forced to run their plant at night to keep up with orders.

FRANK G. FAULKNER, who was well known to the wholesale plumbing trade of New York, died of pneumonia at his residence, 164 Lafayette avenue, Brooklyn, on February 5, aged 56 years. For the past seven years Mr. Faulkner had been with the John Simmons Company, 108 Centre street, who are sending to his many friends in the trade, with their sincere regrets, an announcement of his death. Mr. Faulkner is survived by his widow and one daughter.

E. J. ROHRBACK & BROTHERS, Topton, Pa., are installing a steam heating plant in the Trinity Evangelical Lutheran Church, at Bowers.

H. P. WESLEY, High street, Holyoke, Mass., has been remodeling the plumbing in the residence of Dr. L. L. Clark, and has completed what is said to be a fine piece of work.

THE waste of water through the medium of leaky faucets or defective joints in house service pipes is an important item to water companies, not only in places where a flat rate prevails, but where meters are used, as in the latter case it results in numerous claims of overcharge on the part of consumers. A little device known as the Waterphone, and sold by E. J. Hussey & Co., 80 John street, New York, will reveal any such waste by placing the end of the Waterphone against the pipe, when the flow or drip in any part of a building or street is instantly heard.

THE AMERICAN STEAM GAUGE & VALVE COMPANY,

Boston, Mass., are sending out a doubly useful calendar. Those who use it will find it a convenience owing to the large figures on the date tablets, while the company expect the pictures of a battle ship and an express train on the card to attract substantial attention to the fact that the high grade Ganges and Valves displayed below are used on such important mechanical perfections.

A CIRCULAR giving the price-list of the Nonpareil Cork Protection Covering for frost prooling water pipes is being distrlbuted by J. H. Edwards, 59 Park place, New York. This Covering is made to cover pipes from ½ to 6 inches in diameter. The price-list gives the price for Special Coverings for ells, tees, globe valves and crosses, and also weight of the material per lineal foot. Other information in reference to frost proof piping is also given.

W. AL. LAFFIN, who for the past 17 years has been connected with the Thatcher Furnace Company, has opened an office at 101 Beekman street, New York, as a heating and ventilating engineer. Mr. Laffin will make a specialty of Furnace heating and steam and hot water fitting, and will give some attention to Range work. He is prepared to do the sheet metal work in connection with all kinds of heating and ventilating systems.

THE UTAH PLUMBING SUPPLY COMPANY of Salt Lake City, Utah, have purchased a piece of ground, 65 x 165 feet, facing First South street, on which they propose to erect a two-story warehouse to enable them to accommodate the needs of their growing business.

St. George's Industrial Herald, published in the interests of the St. George's Trade School of New York City, reports that the plumbing class of the school this season has 15 boys on the roll. These pupils have been remarkably attentive and industrious, and have made satisfactory progress. The plumbing class seems to be one of the favorite departments in the school. Instructor Tucker takes a great deal of interest in the boys, and has succeeded in securing positions for a number of them, where they were able to make use of their school training. An attractive feature of the plumbing class room is the display of specimens of the work of the pupils, which are tastefully arranged on the walls.

JOSEPH BRONOLD, Buffalo, N. Y., bid $30,905 and secured the contract for heating and ventilating the Lafayette High School in that city.

C. EDWARD HANTZ, York, Pa., advises us that he has remodeled the building that he recently purchased in that city, and will occupy it with his plumbing and hot water heating and ventilating business.

H. B. SHERMAN MFG. COMPANY, Battle Creek, Mich., have recently purchased the Acme Brass Works of Elkhart, Ind., and removed their entire plant, consisting of machinery, patterns, stock, tools, &c., to Battle Creek, where it has been incorporated with their main plant. The company are now ready to quote prices on and furnish a full line of Automatic Couplings, Brass Hose Pipes, Steam and Common Couplings, Hose Nipples and other goods of this nature.

J. P. EUSTIS MFG. COMPANY, 96 North street, Boston, Mass., for whom Edward A. Grenzbach, 97 Chambers street, New York, is the representative in New York City territory, have issued catalogue D, entitled "The Brasscrafters," showing beautiful and complete assortments of Bathroom and Lavatory Accessories of cast and wrought brass, polished and nickeled. The company also manufacture special Brass and Bronze Statue, Structural and Grill Work.

THE plumbers of Rockford, Ill., have petitioned the City Council to pass an ordinance providing for the inspection of plumbing work done in the city.

EDWARD SCULL, senior member of the plumbing firm of Edward Scull & Co., 10 South Fifth street, Reading, Pa., died suddenly of heart failure at his residence, 48 South Fourth street, on February 5, aged 62 years. In 1857 he was apprenticed to the plumbing trade, but on the outbreak of the Civil War he entered the Ringgold Light Artillery for the defense of Washington. After being mustered out he enlisted in the Forty-second Pennsylvania Volunteers. In 1861 he married Catherine Call, who survives him with three children, one of whom is William O. Scull, a member of the firm.

New Firms and Changes.

E. H. HALL & SON have purchased the plumbing establishment, at Belchertown, Mass., formerly conducted by L. E. Ballou.

THE ENGINEERS' & PLUMBERS' SUPPLY COMPANY of Columbus, Ohio, have been incorporated, with a capital stock of $25,000, by James Westwater, F. M. Rine, Thomas Murnane, W. G. Westwater and Joseph McCue.

HENRY ASHLAND has sold out his plumbing business, at Red Lodge, Mont., and has moved to Billings, where he will work for Yegen Brothers.

THE A. H. DAVENPORT COMPANY, Bangor, Maine, have recently been organized with a capital stock of $10,000 for the purpose of conducting a general plumbing business. The officers of the company are President, A. H. Davenport of Bar Harbor, and treasurer, Charles H. Babb of Bangor.

THE firm of Harris & Partridge, formerly of Jacksonville, Fla., have been organized under the title of the Aurora Acetylene Company, and have moved to Chattanooga, Tenn., where they will continue the manufacture of Acetylene Gas Generators.

JOHN E. MULVIHILL, Providence, R. I., who for the past ten years has been connected with the Thomas Phillips Company, is about to open a plumbing establishment at 3 North Main street.

THE plumbing and steam heating firm of Drury & Green, at Lowell, Mass., have been dissolved by the withdrawal of George Green. Mr. Green has opened a shop at 35 Market street.

THE MCKEOUGH-DANQUER PLUMBING COMPANY have been incorporated at Utica, N. Y., with a capital stock of $5000, by Thomas F. McKeough, Augustus W. Danquer and E. T. Danquer.

PARKHURST BROTHERS are a new firm, composed of A. H. and C. G. Parkhurst, who have entered the plumbing and tinsmithing business at Peterboro, N. H. They will do steam heating, hot water heating, furnace heating, tin roofing and all branches of sheet metal work.

ARMSTRONG BROTHERS of Somerville, Mass., have bought the plumbing and heating business of George A. Glover & Co. at Revere, Mass. In addition to plumbing and heating they will carry a full line of Stoves, Ranges and Furnaces.

WITTENBERG & BUGBEE are a new firm in the plumbing business at 402 Shawnee street, Leavenworth, Kan.

THE AMERICAN DISTRIBUTING COMPANY have been incorporated at Syracuse, N. Y., with a capital of $30,000, for the purpose of manufacturing Plumbing Supplies. W. Romeyn Smith is president and I. A. Weston secretary and treasurer. The company have secured a building at 204 Decker street for a finishing department, and a foundry is being erected at 265 Burnet avenue which is 40 x 70 feet in size. The traveling representatives of the company who will visit the plumbing trade are Harry P. Thompson, C. H. Cadwell and William H. Levere.

At a meeting on February 10 of all the Northwestern manufacturers of sash, doors and blinds at Tacoma, Wash., a permanent organization was formed and a revision of price-lists and trade discounts was made, resulting in the adoption of discounts, giving net prices slightly in advance of those agreed upon at the close of last year. It is understood that a further and more radical advance in prices is likely to be made at the next meeting of the manufacturers, to be held in April.

Under the caption of "Pilgrimage Made Easy," the *Electrical Review* prints the following item: "Cleveland and Chicago capitalists have applied for concessions for electric lines from Cairo, Egypt, to Mount Sinai, and then along the coast of the Red Sea through Syria and Arabia to Mecca, with a branch to Damascus."

Pattern for Elbow Springing from Pipe.

In *The Metal Worker* of October 26, 1901, there was illustrated a method of developing the pattern for an elbow springing from a round pipe. A correspondent signing himself "F. W. B.," and writing from Torrington, Conn., expresses a wish to see an illustration of the method of developing the pattern when the elbow is placed to one side of the center of a vertical pipe.

For the benefit of this correspondent as well as of other readers who may be interested in similar matters, we elucidate the problem, which presents an interesting study in projection. Referring to Fig. 1 of the accompanying diagrams, let A B represent the portion of the plan of the vertical pipe struck from the center C. Let D E 1 7 represent the position of the elbow in plan where it intersects the vertical pipe to one side of its center line. In its proper position draw the profile R, which represents the diameter of the elbow. Divide the profile R into equal spaces, as shown by the small figures 1 to 7. From these intersections parallel to 4 4′ draw lines indefinitely into the plan of the vertical pipe, as shown, intersecting the curve A B at points 1, 2, 3, 4, 5, 6, 7.

In its proper position, above the plan, draw the partial elevation of the vertical pipe, as shown by F G H. At right angles to E 7 in plan and from the point 7 on the curve A B erect a line, intersecting the base line G H in elevation at 7°. This point represents the center line of the elbow in elevation. Take the distance T 1 or T 7 in the profile R and place it on either side of 7° on G H in elevation, thus establishing the points *a* and *b;* then using the desired center, in this case I, with radii equal to I *b* and I *a* describe the quadrants, in which draw the desired pieced elbow, in this case four, as shown by *d e f g a b h i j c*. Draw the miter lines *e j*, *f i* and *g h*.

Now in its proper position draw the profile S, which divide into the same number of equal spaces as shown in the profile R, being careful to start point 1 to the right of the profile S, because if 4 4′ were the axis of the profile S and the point 7 would be turned up toward the reader, the points 1 and 7 would represent the sides of the elbow shown in plan by 1 and 7, while 4 and 4′ in profile S would represent the top and bottom of the elbow 4 and 4′, respectively, in plan. At right angles to E 7 in plan and from the intersections 1, 2, 3, 4, 5, 6, 7 on the curve A B project lines indefinitely into the elevation, as shown from 1″ to 7″. Now at right angles to *d c* in elevation and from points in the profile S draw lines intersecting the miter line *e j* of the elbow, as shown. Parallel to *e f* and from the intersections obtained on the miter line *e i* from points 5, 4, 3, 2, 1 2′, and 3′ in the profile S draw lines intersecting vertical lines having similar numbers, as 5″, 4″, 3″, 2″ and 1″, thus obtaining the intersections 5x, 4x, 3x, 2x, 1x, 2v and 3v, respectively, as shown, and extending the lines drawn parallel to *e f* until they intersect the miter line *f i*. Parallel to *f g* and from the intersections obtained on the

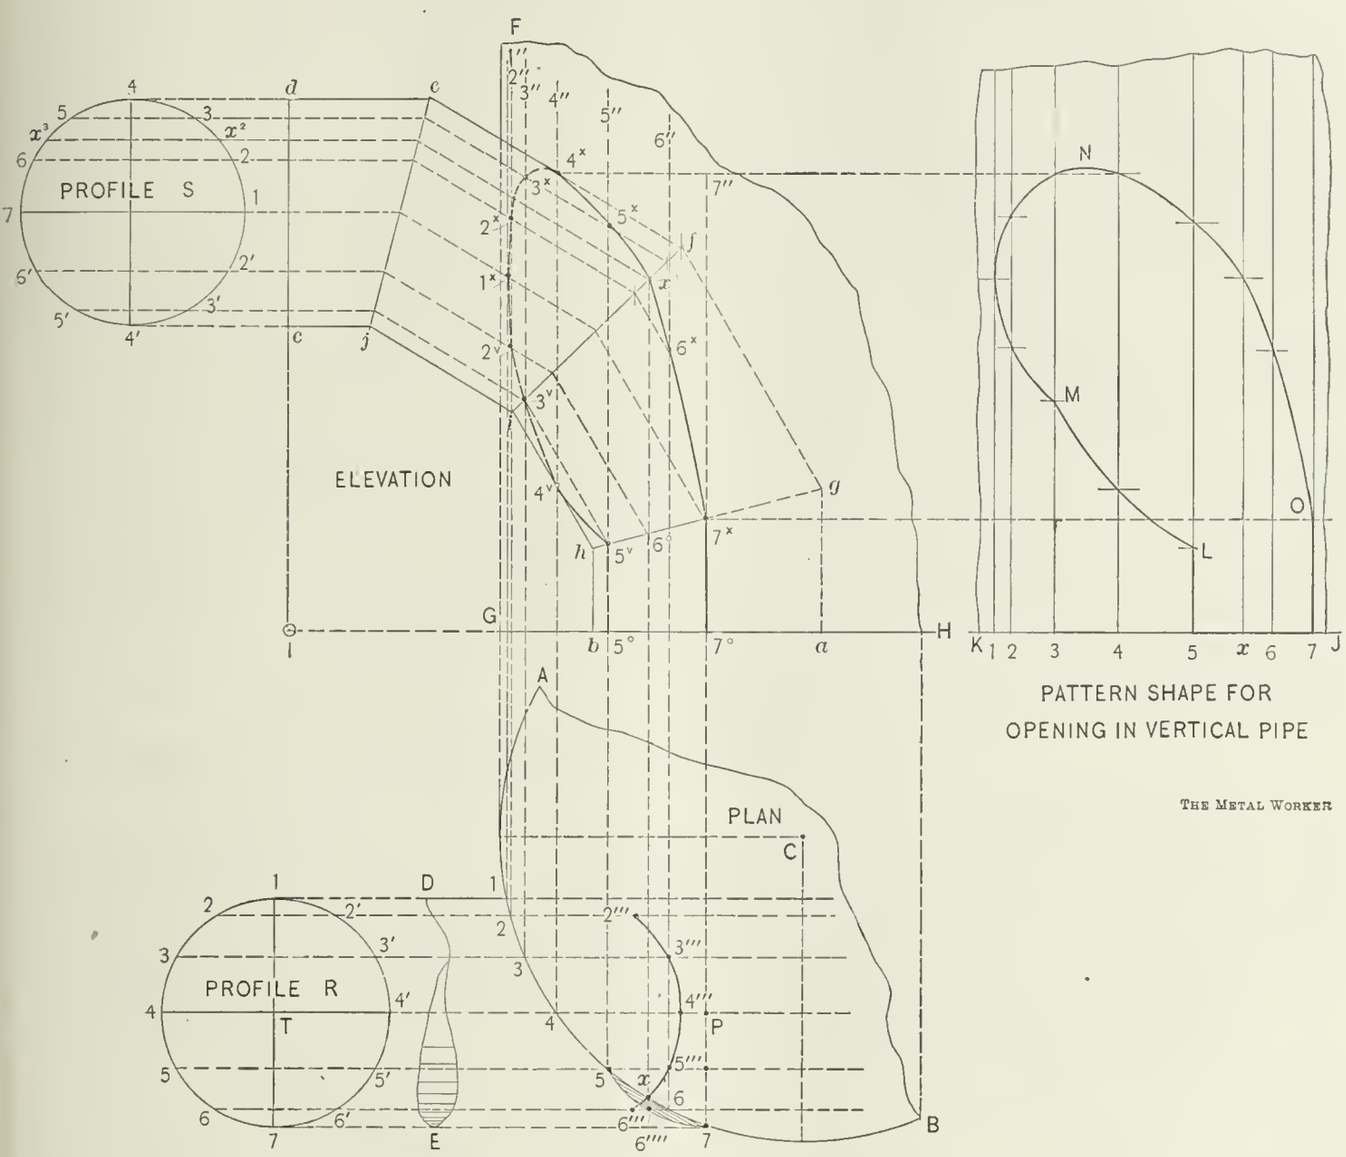

Fig. 1.—Plan, Elevation, Profiles and Shape of Opening in Vertical Pipe.

PATTERN FOR ELBOW SPRINGING FROM PIPE.

miter line *f i* from points 6, 7, 6′, 5′ and 4′ in the profile S draw lines intersecting vertical lines having similar numbers, as 6″, 7″, 6″, 5″ and 4″, thus obtaining the intersections 6x, 7x, 6o, 5v and 4v, respectively, as shown.

It will be noticed that the lines drawn from the points 5′, 6′, 7 in the profile S intersect the miter line *g h* in elevation at 5v 6o 7x, respectively. From these points drop lines until they intersect similar horizontal lines in plan drawn from points 5′, 6′, 7 in profile R, thus obtaining the points 5, 6‴″, 7, which will represent the amount the proceed as follows: From the points of intersections on the miter line *f i* corresponding to points 2, 3, 4, 5 and 6 drop vertical lines, not here shown, intersecting horizontal lines of similar numbers in plan, as shown by the intersections 2‴ to 6‴, respectively. Through these intersections trace the partial elliptical figure, as shown, intersecting the plan of the vertical pipe at X, being the desired point. From X draw a vertical line upward intersecting the miter line *f i* in elevation at X¹. Now through the intersections in elevation draw the miter

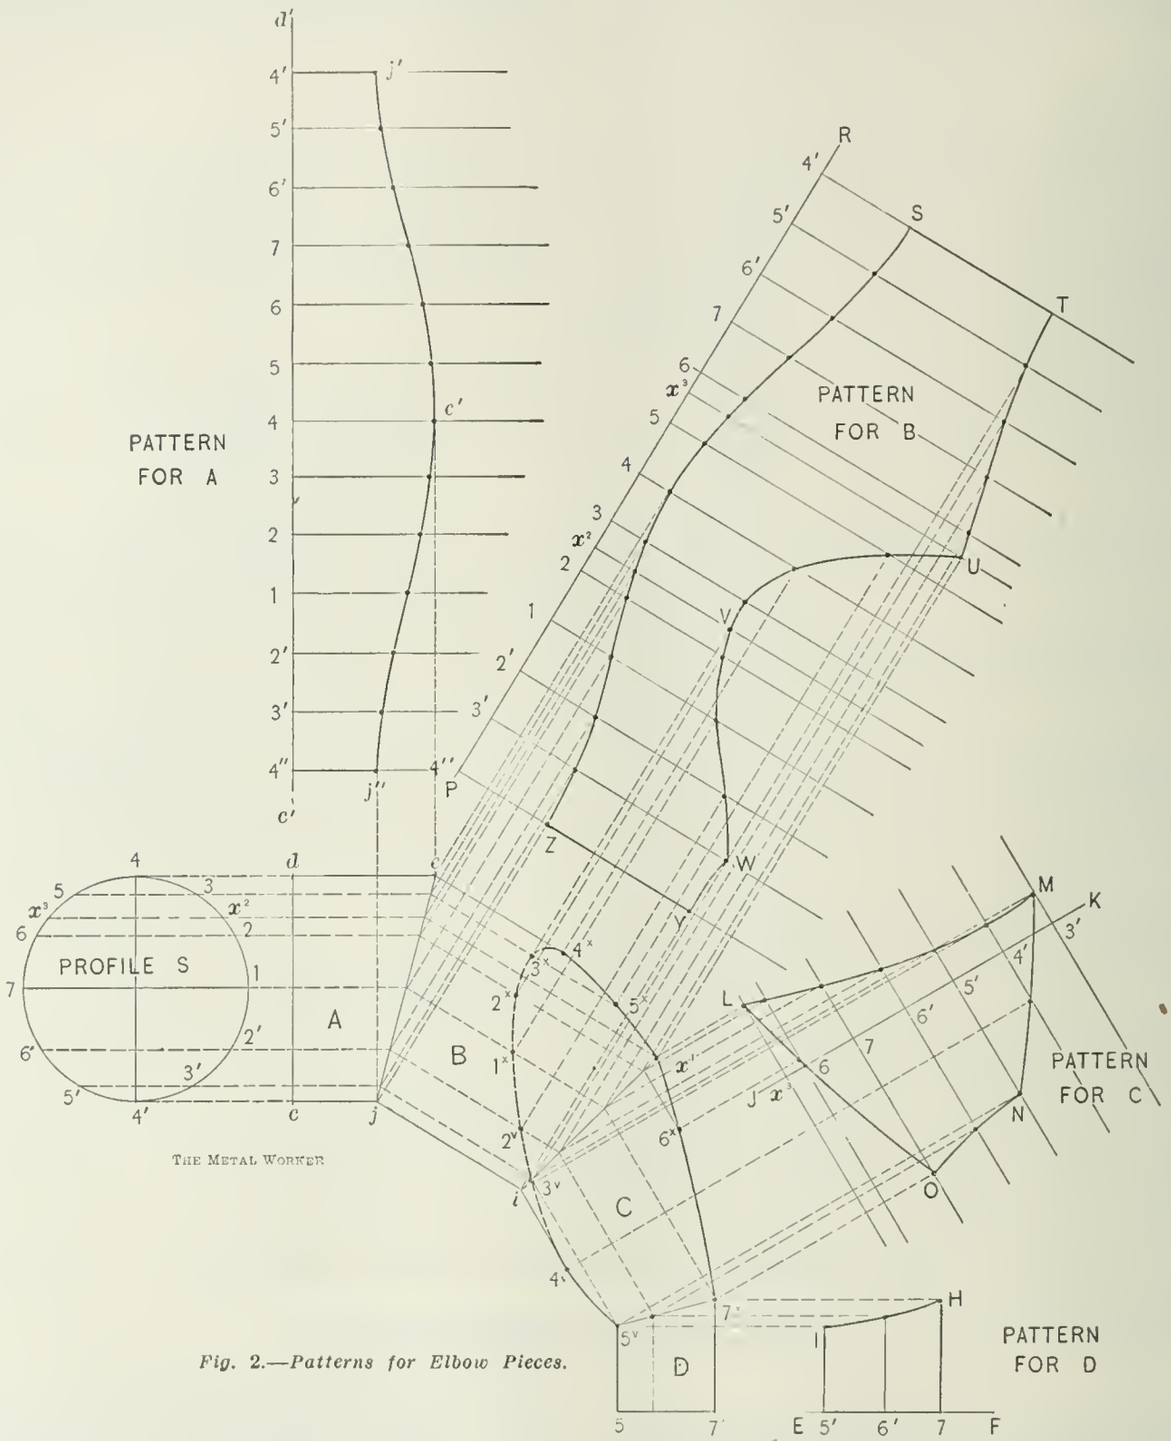

Fig. 2.—Patterns for Elbow Pieces.

PATTERN FOR ELBOW SPRINGING FROM PIPE.

lower section of the elbow will project beyond the vertical pipe, as shown by the shaded portion in plan, and in elevation by 5o, 5v, 7x, 7o.

The center point P in plan, from which the arc 5, 6‴″, 7 is struck, is obtained by the intersection of the line dropped from 7o in elevation to 7 in plan with the line drawn from the center T of the profile R, thus establishing the point P.

Before drawing the miter line through the points of intersections on the vertical lines in elevation it will be necessary to know where this miter line will intersect the miter line of the elbow *f i*. Therefore a partial horizontal section will be required on the line *f i*, for which line, 5o to 5v to 3v to 4x to X¹ to 7x to 7o, which represents the line of joint between the elbow and vertical pipe.

For the pattern for the opening to be cut into the vertical pipe proceed as follows: In line with G H of the elevation draw the line H J, upon which place the stretchout of 1, 2, 3, 4, 5 X, 6 and 7 in plan, as shown by similar numbers on H J. At right angles to H J and from these points carry lines upward, which intersect with lines, not here shown, drawn from intersections having similar numbers in the miter line in elevation at right angles to F G. Trace a line through points thus obtained, as shown by 5 L M N O 7, which will be the pattern for the opening in the vertical pipe. From the point X¹ on

the miter line *f i* in elevation and parallel to *f e* draw a line intersecting the miter line *e j*, as shown. From this intersection parallel to *e d* draw a line intersecting the profile S at X^2 and X^3. These points will be used in developing the patterns for the elbow pieces.

For the patterns for the four pieces in the elbow and to avoid a confusion of lines take a tracing of the profile S with the various intersections on same, also of the elbow with the miter lines and various points of intersections, and place it, as shown, by similar letters and figures in Fig. 2, in which the four pieces in the elbow have been lettered A, B, C and D. For the pattern for the piece D draw the line E F at right angles to 7x 7o, upon which place the stretchout of 5′, 6′, 7 in the profile S, as shown by 5′, 6′, 7 on E F. At right angles to E F erect lines, as shown, which intersect with lines drawn from intersections of similar numbers on the miter line 5v 7x at right angles to 7x 7o. A line traced through points thus obtained, as shown by H I 5′ 7, will be the pattern for D, corresponding to 5, 6″″, 7 in plan, Fig. 1.

For the pattern for C in Fig. 2 draw at right angles to 3v 5v the line J K, upon which place the stretchout of X^8, 6, 7, 6′, 5′, 4′ and 3′ in the profile S, as shown by similar figures on J K, at right angles to which, through the small figures, draw lines indefinitely, which intersect with lines drawn from intersections of similar numbers on the miter lines shown, at right angles to 3v 5v. Trace a line through points thus obtained, as shown by L M N O, which will be the pattern for piece C. For the pattern for B draw the line P R at right angles to *j i*, upon which place the full stretchout of the circle or profile S, being careful to place the extra divisions X^3 and X^2 in profile S in their proper divisions on P R, all as shown. At right angles to P R and through the small figures draw lines indefinitely, as shown, which intersect with lines drawn from intersections of similar numbers on the miter lines shown, at right angles to *j i*. Trace a line through points thus obtained; then will S T U V W Y Z be the pattern for B. In precisely the same manner obtain the pattern for A, which is shown by *d′ j′ e′ j‴ e′*. Allow laps for riveting and seaming.

THE BERGER AND CARNAHAN PLANTS AT CANTON, OHIO.

In the *Roller Monthly* of Canton, Ohio, an interesting account is presented of the big works of the Berger Mfg. Company, the Stark Rolling Mill Company, the Carnahan Tin Plate & Sheet Company and the Carnahan Stamping & Enameling Company, the interests of which four concerns are closely allied and which, combined, form one of the greatest manufacturing enterprises of its kind in Ohio.

The growth of the Berger Mfg. Company has been remarkable. The business was started in 1886 with half a dozen men. It was situated in the basement and afterward in the second story of a blacksmith shop. The business extending, the factory was soon moved to more commodious quarters, where additional men were employed. Another move was made necessary within a short time, and then it became imperative to erect large buildings for the accommodation of the firm's growing business. A site was secured at what is known as Crystal Park, and the nucleus of the present large establishment was built there. Many additions and improvements were subsequently made, as the output of the concern became heavier and more diversified, and it was only a few years before the Berger works became one of the leading manufacturing industries of the city of Canton. The establishment of the plant in the northeast part of the city of Canton gave a stimulus to real estate in that section, streets being laid out and numerous dwellings to shelter the families of the workmen being erected. Gradually the locality grew up to be one of the pleasantest portions of the city.

The output of the Berger Mfg. Company is principally sheet iron and steel products, such as eave trough, conductor pipe, and roofing and siding of all kinds, cornices, architectural iron work, skylights, metal ceilings, and, in fact, all varieties of structural sheet metal goods. Fire proofing, lanterns, oil cans and spray pumps were subsequently added to the products of the concern and now form a large part of their manufacturing business.

The past year was by far the most prosperous in the history of the company, the output being nearly double that of any previous year. Under the management of Edward A. Langenbach, the secretary and general manager of the company, the operation of the factory has been systematized, each department working under a separate superintendent, who reports to the general manager. In one building, 60 x 600 feet, cornice, eave trough and conductor pipe are produced. In another department, 48 x 250 feet, the product is roofing and siding, including imitation brick and stone. A third department is devoted to the manufacture of all styles of tubular lanterns, including street lamps and railroad lanterns, also oil cans, pumps, &c. The metal ceiling department, housed in two buildings, 40 x 120 feet and 30 x 60 feet respectively, is one of the most important. The company's Classik metal ceilings are now well known throughout the country. Other departments of the concern include a galvanizing shop, 48 x 300 feet; a black sheet warehouse, 50 x 200 feet; warerooms, 40 x 326 feet, and offices, modeling, refining, fire proofing, painting and shipping departments, together with boiler house, electric plant, blacksmiths' shop, gas producers, &c., all housed in separate buildings.

Eighteen traveling salesmen are on the road selling the products of the company, and branch houses have been established in New York, Boston, Philadelphia, Chicago and St. Louis. Agencies have also been opened in many other leading cities of the country.

The original Berger Mfg. Company took their name from John and William Berger, who were the founders of the business. The present officers of the company are Joseph Biechele, president; Charles Lang, vice-president; W. W. Irwin, superintendent, and Edward A. Langenbach, secretary and manager. Mr. Irwin was formerly with the Canton Rolling Mill Company and later with the Dennison Rolling Mill Company of Dennison, Ohio. After the absorption of the latter company by the American Sheet Steel Company he returned to Canton and purchased the John A. Berger interests in the Berger Mfg. Company.

THE STARK ROLLING MILL COMPANY.

The Berger works consumed so large an amount of sheet metal and the expense of transporting it to Canton was found so heavy that it was decided a short time ago to establish a rolling mill alongside of the present plant. The Stark Rolling Mill Company were formed for this purpose, with J. E. Carnahan as president; Joseph Biechele, vice-president; Charles Irwin, secretary, and Edward A. Langenbach, manager.

Much of the success of the concern has been due to the efforts of Mr. Langenbach, who has been manager of the Berger Company ever since their organization. To his influence is due the bringing to Canton of the Carnahan Industries, which have become allied with the Berger Interests. J. E. Carnahan, from whom the Carnahan Tin Plate & Sheet Company and the Carnahan Stamping & Enameling Company took their names, is one of the most successful men in the iron and steel industry. He was the founder of the Mesta works in Pittsburgh and also of the Canton Roll & Machine Company.

THE CARNAHAN TIN PLATE & SHEET COMPANY,

organized last year to build a plant for the manufacture of tin plate and black plate, have an annual output of some 12,000 tons of finished material and employ 600 men. The machine building is 125 x 600 feet, and is one of the finest and most complete tin mills in the country. George Evans, the superintendent of the plant, is regarded as one of the most competent tin mill men in the United States. He was formerly the superintendent of the Beaver Tin Plate Company of Lisbon, Ohio. Mr. Evans is assisted by Edwin Griffith, another expert tin mill man, formerly with the Star Mills of Pittsburgh. The company are officered as follows: President, J. E. Carnahan; vice-president and general manager, Edward A. Langenbach; secretary and treasurer, Wil-

llam M. Blecker. Mr. Blecker is from Leechburg, Pa., and was for a number of years connected with large iron and steel plants in various parts of the State of Pennsylvania. He was one of the founders of the Canton Roll & Machine Company.

Plans are already under way for and work will soon be begun upon the erection of a steel mill to produce 1200 tons a week, in connection with the Carnahan plant. Other extensions to the plant are also in contemplation which will very largely increase the capacity. The output is used almost exclusively by the Berger works and

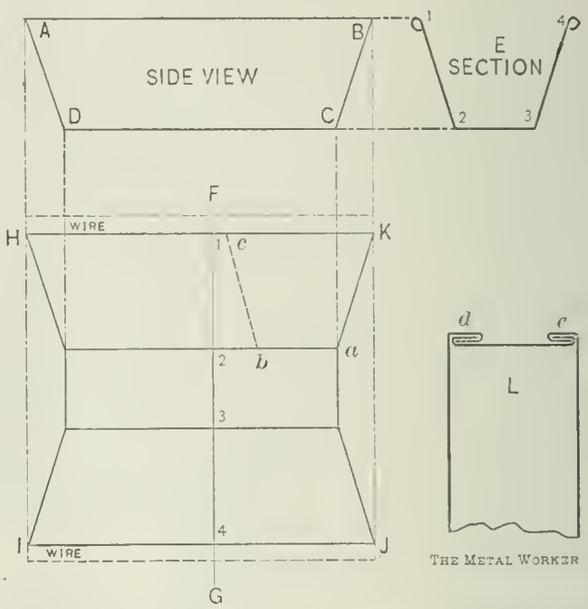
THE CARNAHAN STAMPING AND ENAMELING COMPANY.

The last named company have been organized for the manufacture of stamped and pieced tinware, galvanized ware, enameled ware and fruit cans. The plant is now under construction and is expected to be in full operation by about March 1. The main building is a four-story brick structure, 50 x 200 feet. The stamping and enameling building is 90 x 120 feet, the galvanizing building 30 x 90 feet and the boiler house 32 x 42 feet.

The company are capitalized at $300,000 and the officers are: President, J. E. Carnahan; first vice-president, William M. Blecker; second vice-president, H. C. Milligan; general manager, Edward A. Langenbach; secretary and treasurer, Millard F. Taylor. Mr. Taylor is from Leechburg and was formerly the secretary of the Canton Rolling Mill Company until that concern were absorbed by the American Sheet Steel Company in 1898. H. C. Milligan, the second vice-president, has charge of the enameling department. He is an expert in this line, having been for many years with the Lalance & Grosjean Mfg. Company of New York City, the largest enameling concern in the world. In 1884 he patented his process of enameling and some years later built the Crescent Enameling Works, at Cleveland, Ohio, which plant he conducted successfully until he recently consolidated with the Carnahan interests and removed to Canton. The process under which the concern will operate is known as the Milligan process.

Taken all together, the four companies named employ not less than 2000 men, which means nearly 10,000 people in the city of Canton practically dependent upon the allied enterprises. It will thus be seen how important these enterprises are to the prosperity and welfare of the city of Canton.

Imports of Tin Plates in 1901.



The annual figures of the Treasury Bureau of Statistics for 1901, just published, show a total importation of tin and terne plates and taggers tin for the year amounting to 86,682 tons, as compared with 67,632 tons in the calendar year 1900 and 65,935 in 1899. This shows a marked growth in the imports of tin plates into the United States last year as compared with preceding years, caused obviously by the closing down of the tin plate mills for over three months last summer owing to the strike and the consequent restriction in the production of domestic tin plates. The importation of sheet, plate and taggers iron or steel in 1901 is placed at 6301 tons, as compared with 5761 tons in 1900 and 7884 tons in 1899. The total imports of pig tin in 1901 are given as 37,280 tons, as against 34,995 in 1900 and 35,624 tons in 1899.

THE NOVELTY HEATING COMPANY, Jamestown, N. Y., have the contract for the copper work for the new fire proof storehouse of the American Aristotype Company. They are also putting up a handsome steel ceiling in the shoe store of Bealor & Sons, and in the store of the Greek-American Fruit Company. The company are making the Steel Cornices and Skylights, and are putting on a tin roof and a steel ceiling in the Merz & Thomas Building. They also have the contract for the Cornices and Skylights in the buildings of H. A. Shafer, the Home Telephone Company and Andrew Runquist, and are putting a tin roof on the City Armory in place of the slate roof that has been on it for years.

PATTERN FOR BREAD PAN.

Without Allowance for Laps.

A bread pan can be made of tin plate or sheet iron, and can be bent over the hatchet stake if no brake is at hand. The top edge is wired, and the ends double seamed. Let A B C D, in the illustration, be the side view of such a bread pan, having equal flare on four sides, and E the section, showing the amount of material required for the body of the pan, as indicated by the small figures 1, 2, 3 and 4. For the pattern draw any line, as F G, at right angles to D C, upon which place the stretchout of the section E, as shown by the small figures 1 to 4 on F G. Through these small figures and at right angles to F G draw lines, as shown, which intersect with lines drawn from similar points in side view, as shown. Trace a line through intersections thus obtained, as shown by H I J K, which will be the pattern for the body of the pan. As the flare of the pan is equal

Pattern for Bread Pan.

throughout, as before mentioned, then for the pattern for the end pieces simply take the distance 3 to 2 in section and place it, as shown, from *a* to *b* in pattern, and the distance 4 to 1 in section and place it from K to *c* in pattern. Connect these points, when K *a b c* will be the pattern for ends. Allowance for wire is shown by the dotted lines. Diagram L shows the method of double seaming the ends or heads to the body, as at *d* and *e*, showing that single edges must be allowed to the ends and double edges to the body of the pan. Wire rings can be riveted to the ends if desired.

FLASHINGS.

THE MONUMENTAL MFG. COMPANY of Baltimore, Md., have been incorporated by Jacob W. Hook, Walter Snyder, C. Howard Hook and others, with a capital of $50,000, to manufacture Tin Specialties.

THE NEW ENGLAND STEEL ROOFING COMPANY, 274 Main street, Worcester, Mass., have been very busy recently, working nights at times to keep up with their orders. They have contracts for a large amount of Sheet Metal Work in Maine, including the High School at Lewiston, City Hall at Waterville and the Odd Fellows' Block, and a new hotel at Rumford Falls.

BESEMAN & BOSTWICK of Hartford, Conn., have the contract for the metal work on the new Opera House, at Winsted, Conn.

THE offices of the Parkersburg Iron & Steel Company, which are at present located in the Times Building, Pittsburgh, Pa., will, after April 1, be moved to Parkersburg, W. Va., where the company's mills are located.

WE are indebted to C. S. Trench & Co., New York City, for a copy of the useful Pig Tin chart that they have prepared and are distributing among the trade. The chart shows the movements of prices of Pig Tin in each month of the four years, 1898 to 1901. The highest,

lowest and average prices made by the metal are also indicated for each month. The exhibit shows that Tin made its lowest record of recent years—13¾ cents—in January, 1898, and its highest—35 cents—in July, 1900.

The E. Van Noorden Company, Boston, Mass., have recently placed 28,000 square feet of their Sheet Metal Skylight in the plant of the Great Northern Paper Company, at Millinockett, Maine. They have also just furnished Skylights of their coustruction for J. E. Henry & Sons' new pulp mill, at Lincoln, N. H.; for the Crane Company, at Dalton, Mass., and the Oxford Paper Company, at Rumford Falls, Maine, and are now erecting a large Skylight 16 feet span by 177 2-3 feet long for the Eastern Mfg. Company's paper plant at South Brewer. In addition, the company are now erecting 260 Single Pitch Skylights, each 7 feet 7 inches by 8 feet, aud 40 7 feet 7 inches by 9 feet 11 inches, each for the Soule Mills, at New Bedford, Mass., as well as 496 Single Pitch Skylights 8 x 8 feet, and 103 Revolving Ventilator Cowls 18 inches in diameter, for the Atlas Tack Company, at Fair Haven, Mass.

The plant of the American Tin Plate Company, at Atlanta, Ind., is beiug dismantled. It is understood that the buildings and ground will be purchased by the Uuion Traction Company of Indiana, and used for the erection of a plant for the manufacture of Electric Railway Machinery.

The tinning department of the Carnahan Tin Plate & Sheet Company, Canton, Ohio, was started last week. Three of the six eold rolls were also placed in operation and two additional hot mills will shortly be added.

The machinery of the plant of the American Can Company, at Youngstown, Ohio, is being removed, aud will be iustalled in some of the company's factories in Chicago. The reason for the dismautling of the Youngstown plant is that it was located too far from the center of the can market.

Torbett & Beckham, Monadnock Building, Chicago, have purchased from the American Sheet Steel Company the land and buildiugs at Hammond, Ind., formerly used by the Corning Steel Company, in the mauufacture of Sheets, and will adapt them to other manufacturing purposes. The Corning plant was dismantled on coming into the hands of the American Tin Plate Company about two years ago.

Revived rumors of a eousolidation of the independent Tin Can manufacturing iuterests of the country have been current during the past week. It is claimed that substantial interests have the matter in hand with considerable prospeet of a favorable outcome. The fact that the American Can Company are closely allied with the United States Steel Corporation would seem to offer a serious obstacle to any organization of independent manufacturers in this line, as they would be obliged to purchase their supplies of Tin Plate from the steel corporation, who have practically the monopoly of this product in the United States. For this reason it would seem that an independent concern working in antagonism to the American Can Company might experience more difficulty in securing supplies of material than would be met with by individnal plants, whose operatious would not be important enough to come into violent competition with the so-called Tin Can Trust.

The Treasury Bureau of Statistics has issued the statistics of drawback allowed on imported material used in the manufacture of goods subsequently exported for the fiscal year ended June 30, 1901. This statement shows that the quantity of Tin Plate, on which a drawback of 99 per cent. on the original duty paid was allowed in the period named, was 127,261,883 pounds, as compared with 125,269,126 pounds in the preceding fiscal year, and 122,906,682 in the fiscal year 1899.

The American Rolling Mill Company of Chicago, who are operating a Sheet plant at Middletown, Ohio, have purchased the rolling mill at Sandwich, Ill., which has been idle for some time. This plaut has a 9-ineh finishing train of rolls, and an 18-ineh, three-high muck mill. The company, it is said, will install a 16-ineh train of finishing rolls, and will also build eight double busheling and puddling furnaces.

The Juniata Tin Plate Company, recently incorporated with a capital stock of $250,000, will build a Tin Plate plaut at Greencastle, Pa., of which F. M. Strong, for a number of years manager of the plant of the old American Tin Plate Company at Ellwood, will be the manager. Others interested are Samuel Lewis, William H. Richards, J. H. Seibeiling and H. M. Strong.

A discovery of Tin deposits is reported about 12 miles from Cape York in the Cape Nome district of Alaska. The Tin bearing territory is said to cover some 2000 acres to an average depth of 6 feet. A small amount of the ore which was recently assayed is claimed to have yielded nearly 65 per cent. metallic tin.

Neal Brothers of Pittsburgh, who are operating a mill on the South Side in the mauufacture of Black Sheets, are preparing to install a galvanizing plant to make Galvanized Sheets for the open market.

The new plant of the Carnahan Tin Plate & Sheet Company, at Canton, Ohio, is in operation to full capacity, turning out all grades of Tin and Terne Plate, also Black Plate. This concern have decided to add another mill to their plant, which will make it a seven-mill plant, and advise us they have all the orders they can take care of for the next four months to coue.

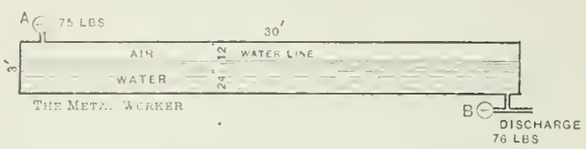
A movement is being made in Baltimore, Md., to establish in that city a Sheet Metal Workers' Union. This is the first time the formation of such a union has ever been attempted in that city. The proposition of the new union is that nine hours shall constitute a day, and the minimum wage shall be $2.50, and that only union men are to be employed, although nonunion men may be taken on upon the condition that they join the union within a week after being so employed. It is further demanded that only one appreutiee be allowed for every four journeymen, and the apprentice must serve four years, or longer if deemed necessary in the opinion of his employer to complete his trade. The employers represented at the meeting were John G. Hetzell & Son, Vaile & Young, M. J. Frederick & Bro., the Northwestern Cornice Works, A. Kohlhepp, Schultz & Ellis and William T. McDermott.

The Leading Exporter.

The Uuited States maintained its position as the leading exporting nation in the caleudar year 1901. The figures of the Treasury Bureau of Statistics, just published, show the exports of each of the principal countries of the world at the latest available date, and clearly indicate that the exports of the United States were during the year larger than those of any other nation. While the total for the full caleudar year is only shown in the case of a few of the more important nations, the monthly average for the portion of the year for which figures are available is showu in the case of practically every country. This statement shows that the average mouthly exportations in the year 1901 were: United States, $119,840,333; United Kiugdom, $113,753,987; Germany, $90,242,000; France, $66,929,329; Netherlands, $56,790,923; Austria-Hungary, $32,012,746, and Belgium, $28,678,729. For the full calendar year figures of the Uuited States and United Kingdom are available. They show: United States, $1,438,083,000; United Kingdom, $1,365,047,843. The exports of the United States thus exceed by nearly $75,000,000 those of the United Kingdom.

Ou the import side the United States stands fourth in the list of nations, the imports for the calendar year averaging $73,368,421 per mouth, against $211,789,669 for the United Kingdom, $111,646,000 for Germauy, $75,483,423 for France, $65,922,642 for Netherlands, $34,942,018 for Belgium and $28,600,569 for Austria-Huugary.

The House Committee on Coinage, Weights and Measures last week heard representatives of leading manufacturers and business men on the advisability of adopting the metric system of weights and measures. The sentiment developed was nearly unanimously favorable to the adoption of the metric system, and it is regarded as almost certain that a favorable report on the measure now pending will be made to the House by the committee, with an exeellent prospect of the bill passiug at the present session of Congress.



THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

A QUESTION OF WATER PRESSURE.

From W. & Co., Chariton, Iowa.—To settle a dispute, we desire information from *The Metal Worker*, or an experienced reader, on the following proposition: Water is forced in at the bottom of a horizontal boiler until the gauge indicates a pressure of 75 pounds. Should this boiler be raised to a vertical position, would the

A Question of Water Pressure.—Fig. 1.—Boiler in Horizontal Position.

pressure remain the same, or would it be greater, or discharge the water from a nozzle with any greater force than if it had remained in a horizontal position?

Answer.—This proposition has been referred to an expert, who has sent us the following:

In reply to the question relative to the difference in pressure in horizontal and vertical boilers, I would say that in the case cited, where the outlet and gauge are at the bottom of the boiler, the gauge would indicate higher pressure when the boiler is in a vertical position, the increased pressure being due to the head of water. To make this clear, let it be assumed that the boiler is to be 36 inches in diameter and 30 feet long and filled one-third with air and two-thirds with water. It makes no difference in what position the boiler is placed, the relative volume of air and water remains the same, but the hight of the water line from the base of the boiler is dependent on the position of the boiler. The accompanying sketches will make this clear, Fig. 1 indicating

Fig. 2.—Boiler in Vertical Position.

the boiler in a horizontal position and Fig. 2 the same boiler in a vertical position. The pressure gauge is generally placed at the top of the boiler, as at A in both sketches. In this position it indicates the pressure acting on the surface of the water. As stated, the relative volume of air and water does not change; consequently, when the boiler is horizontal and two-thirds full, the boiler being 36 inches in diameter, there is a head of water of 2 feet resting on the bottom of the same. This head of water produces practically 1 pound pressure, which, added to 75 pounds, makes 76 pounds pressure at the gauge B, or at the discharge, instead of 75, as indicated by the gauge A at the top of the boiler.

Now, if the same boiler and its contents are placed in a vertical position, it would be found that the water fills two-thirds of the boiler. The hight of the boiler being 30 feet, there is a head of water of 20 feet, that will produce a pressure of about 10 pounds at the discharge or bottom of the boiler. This makes the gauge A read 75 pounds for the pressure acting on the surface of the water, plus the 10 pounds pressure due to the head of 20 feet of water, making a total of 85 pounds pressure at the gauge B when the boiler is in a vertical position, against 76 pounds pressure when the boiler is placed horizontally. The figures in this calculation are not exact, but are sufficiently correct for use in illustrating the point in question. In reply to the second part of the question, I would say that the higher the pressure the greater the discharge.

WHY DID THE VALVES FREEZE?

From N. K., New York.—The statement "F. L. W." makes in *The Metal Worker* of February 8 is one that I can hardly understand in reference to radiator valves, if all the conditions are exactly as he states. If he found the stuffing box of the valve flooded and frozen I could see how, under some conditions, this might happen; but they would have to be unusual, for, in a long experience, I have never known such a thing to happen. The bonnet, however, is so constructed in valves with which I am familiar that it would seem impossible unless the radiator and piping were flooded when the freezing occurred. He says that the valves on the radiators are left open, so that the water can run back to the boilers. If there are positive air valves on the radiators they might hold 2 or 3 inches of water in the bottom of the radiator and flood the valve, and cause the trouble mentioned without the water freezing in the radiator to such an extent as to cause its destruction. I would suggest that he make an examination of his air valves, and if they are not in good condition replace them with a good automatic air valve. The radiator valves should also be carefully examined, and if their construction is such as to be conducive to the trouble reported, they should be replaced with a radiator valve of better construction.

PROTECT TANK PIPE FROM FREEZING.

From J. H. Edwards, 59 Park place, New York.—Replying to the inquiry of "S. and S." in *The Metal Worker* of February 8 regarding the protection of a tank supply pipe from freezing, there are four principles which are very frequently neglected or omitted, and lack of knowledge, which is the cause of all the trouble of the tank pipe freezing. The neglect consists in not having the pipe absolutely water tight before applying the covering; in not using proper nonconducting material, in a poor or careless application of it and in not changing the temperature of the water in the tank at least once a day. The best possible form of nonconducting material applied to exposed water pipes creates no warmth, acting simply as a nonconductor to frost from the outside surface of the pipes. During freezing weather the temperature of the water in the tank should be changed at least once every 24 hours by pumping a few hundred gallons of water into it, which, if taken from a spring or well, will be at a temperature of about 50 or 52 degrees. If this is not done during freezing weather the water in the tank will reach freezing point, and in consequence the water in the pipe will freeze from the inside, and all the protection that might be applied will not prevent it. If "S. and S." will see that their pipe is absolutely water tight, also that where it enters the tank, there is no possibility of leakage occurring, and will apply a proper nonconducting material, they will find this will absolutely protect their pipes from freezing under any temperature. I would suggest the use of sectional cork pipe covering, 2¼ inches thick, carefully applied, so that all joints are absolutely tight, and then wrapped with canvas, painted with two coats of water proof paint, carrying this covering flush

against the tank bottom and extending it to at least 4 feet below the ground. Then, during freezing weather, change the temperature of the water every day by pumping more water into the tank.

ZINC FOR MILK VESSELS.

From J. C. B., New York.—I find cause for objection to the answer to the inquiry of "F. W. K." in *The Metal Worker*, February 8, as to the advisability and propriety of using zinc as a material for a vessel to be employed as a container for milk. What you tell your correspondent is, I fear, misleading, and may do much harm. It is a safe generalization that zinc should never be brought into contact with any fluid to be subsequently taken into the human system. All waters, almost without reference to their chemical composition, dissolve zinc and all the salts of zinc are poisonous. Thorough cleansing of the surface of zinc, of course, reduces the danger of poisoning, but it is impossible to insure the maintenance of cleanliness, and if it were the trouble would be at best mitigated, not corrected. It involves a violent stretch of the imagination to believe that the bottom of a milk tank, 11 x 3 x 1½ feet, would be kept as clean as you prescribe. But if it could be, the danger would still be sufficiently serious to discourage the use of that metal in such a place. Your reference to the general use of zinc in water coolers should not, I think, be considered as warranting such use. It accounts for a great deal of stomach and bowel trouble among those who drink water from such coolers. This fact is well known among chemists and physicians, and has been stated in every text book relating to the chemistry of metals for half a century. Black iron treated with asphalt varnish would make a much better milk tank than one with a bottom of sheet zinc.

Note.—Our answer treated a case where the zinc bottom had already been put in the tank as the most available material in an emergency, and did not advise the use of zinc. Our views on this question correspond, in the main, with those of this correspondent.

NOISY BOILERS

From F. B. H., Lisbon, Ohio.—I would like to inquire what causes a kitchen range boiler to make a rattling, cracking noise when cold water is drawn at the sink.

Answer.—This might be caused from a loose part in some of the bibs connected with the plumbing system: or it might be caused by the water being at a high temperature, and when the pressure in the boiler is reduced by the relief afforded from opening a faucet, the water then changing to steam quickly and the quick condensation causing a vacuum that would make a jar and a rattling as water rushed in to fill the vacuum. If the pipes run up to the ceiling, and are then carried over to the sink and dropped down, air might accumulate at the high point in sufficient quantity to impede the flow, causing a rattling and jarring of the piping, which might carry the sound to the boiler, where it is given off and attracts attention.

A QUESTION OF BOILER POWER.

From T. N. R., New York.—Will you kindly inform me how many feet of 1-inch pipe, attached to a 10 horse-power boiler, can be used as a radiator in an evaporating chamber, and a pressure of 80 pounds per inch be maintained ?

Answer.—About 2.9 lineal feet of 1-inch pipe are equivalent to a square foot of heating surface. One boiler horse-power is equivalent to about 33,000 heat units per hour. Steam at 80 pounds gauge pressure has a temperature of approximately 323 degrees. A pipe coil, with natural circulation of air, will give off about 2 heat units per square foot per hour per degree difference in temperature between the steam and the surrounding air. With forced circulation produced by a fan the heat given off would be five or six times the amount just stated. Our correspondent does not state the temperature to be maintained in the evaporating chamber. Assuming this, however, to be 140 degrees, the difference in temperature between steam and air would be 323° — 140° = 183°, and a square foot of heating surface would give off 2 × 183° = 366 heat units per hour. A 10 horse-power boiler would produce 10 × 33,000 = 330,000 heat units per hour, which, divided by 366, gives approximately 900 square feet of heating surface, equivalent to 2.9 × 900 = 2610 lineal feet of 1-inch pipe. If the evaporating chamber is to be kept at a lower temperature than that assumed the boiler will be capable of supplying less surface; if at a higher temperature more surface, based on the difference in temperature as above stated.

IS IT POOR DRAFT ?

From J. S. R., Philadelphia.—I have noticed the inquiry of "B. R." in *The Metal Worker* of February 8, and think you have solved the problem in the query with which you have have headed his letter, "Is it Poor Draft?" To my mind there is no question but that the trouble is entirely due to the poor draft. The description shows just exactly what might naturally be expected under the conditions presented. Here is a furnace in which all the coals have reached the state of incandescence, and the fire needs replenishing with fuel. When fresh fuel is added the intense heat expands the coal and liberates the gas in large quantities. The draft door is open, causing the air pressure under the grate to drive the gases up. The gases being unable to escape, owing to the poor draft, expand under the influence of the fire, and when they come in contact with a small amount of air through any crevice in the construction an explosion occurs from the expansion or ignition of these gases, which blows the door open. If, as "B. R." describes, there was a good draft, the gases might be carried away fast enough to cause an absolute waste of fuel, and surely fast enough to avoid the explosion. If he will clean the chimney, see that it is of proper shape and sufficient size for the surface of the grate and quantity of fuel under combustion, or enlarge his smoke pipe so that the draft will not be throttled, he will be working along the right lines to learn the cause and remove the trouble reported. I shall be glad to hear from other practical furnacemen as to whether my views on this subject are correct. I hope also that "B. R." will take up the suggestion for improving *The Metal Worker* made by "H. & W.," in the paper of January 25, and will report what experiments he tries and what success has attended these experiments.

Openings for American Trade in Siam.

There is not in the whole of Siam at present, says United States Consul-General Hamilton King of Bangkok, in a recent report to the State Department, one American house competent to consider a business proposition or a Government contract, to push American trade, or to represent American interests. Other nationalities are well represented and are constantly seeking business. It cannot be expected that business will seek Americans in Siam more than in any other country. The Consul-General is of the opinion, after a residence of three years and a half in Bangkok, that an American business house should be established in that city, and that there is an excellent outlook for such an enterprise. To build up an American trade in Siam the house, he says, must be run on American lines and managed by American business men, who are on the ground, and who have acquainted themselves with the local conditions. Among the prime needs of the city he mentions the necessity for a sewerage system, the absence of which at the present time accounts largely for the epidemics of cholera and other scourges which periodically visit the city and carry off thousands of its inhabitants. The country of Siam is of great natural wealth, which only needs the requisite enterprise and capital to develop it. The Consul-General believes that a great field exists there for American enterprise, not only in the line of trade, but also in engineering and the undertaking of mining, agricultural operations and public works, in which undertaking Americans would, he believes, have the ready support of the Siamese Government. Among the goods which he mentions as being sure to find quick sale are clocks, lamps, bicycles and sewing machines.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and ½c. higher in price.

Copper is still unsettled and a shade lower, with light demand.

Pig Lead is very firm and more active.

Spelter remains weak and dull.

Antimony is unchanged.

Nickel is in good demand at former prices.

Aluminum is active at unchanged prices.

Tin Plates are quiet and unchanged.

Sheets are very strong and active.

Sheet Copper is in sharp demand at the higher price.

Scrap Iron is very active and higher in price.

Pig Iron is moving in large volume, with prices strong and higher.

Hardware is in active demand and prices in general rule firm.

Plumbers' Brass Goods are still unsettled as to prices and the demand tame.

Wrought Iron Pipe is active, with prospects of an early advance in price.

Solder is strong, with advancing tendency.

Wire Nails are firm and in good demand.

Cut Nails are firm, with increased demand following recent cut in price.

White Lead is more active and firmer.

METAL MARKET.

NEW YORK, February 14, 1902.

Pig Tin.—Prices have advanced about ½c. here, although London advances were considerably larger. Business, however, was very tame, with an absence of speculation, and consumers buying only in limited quantities for the satisfaction of their immediate requirements. The reason given for the comparatively small advance here is that supplies are ample and business coming from the interior is extremely small. The tone of the market, however, was very firm at the close. Jobbers quote Straits Pig in small lots at 25½c. to 26c. per lb. The total arrivals of Tin since the beginning of the month have amounted to 1380 tons..

Copper.—Manipulators and speculators are still the ruling factors in the Copper market. Their operations, however, have tamed down a good deal. They succeeded in bringing up wholesale prices for Lake Ingot to 13c., but the market since then has quieted down and is now lower. The fact that the large consumers have been filled up by the producers makes realizations on speculative holdings quite difficult, and is regarded as tending to prevent any radical advance in the near future. Jobbers quote Lake Ingot in small lots at about 13¾c. to 14c. per lb., and Casting Copper at 13½c. to 13¾c. The market here was quite dull, there being but a light demand from consumers.

Sheet Copper.—The advance of 2c. in the price of Sheet Copper made last week by the manufacturers does not seem to have unfavorably affected the demand, which is referred to as extremely heavy. Most of the mills are working to full capacity in order to keep pace with the demand from consumers. Stocks throughout the country are evidently very light, for the call is urgent for lots for spot or early future deliveries. The outlook is regarded as favorable for a large consumption of Sheet Copper during the present year. Sheet Copper in small lots from store is quoted on the basis of 18c. per lb.

Pig Lead.—This metal is firm, and some disposition is shown on the part of speculators to engage for future deliveries. The local demand seems to be of moderate proportions, although representatives of the American Smelting & Refining Company state that it is larger than usual at this season of the year. The company are now charging an additional 50c. per ton for spot Lead, and prices, as a whole, show great firmness. Jobbers quote American Pig in small lots at 4.45c. to 4½c. per lb. St. Louis advices indicate an improved tendency in the market for Pig Lead at that point, the volume of business in the past week having been on a much broader scale and prices holding firm.

Spelter.—This metal is still somewhat weak. Offers from the West came into the market in good volume, but buyers were scarce. It seems that the refiners who held back their metal in anticipation of the consolidation which was not effected are now willing, and, in fact, anxious to be relieved of their stocks. Prices show no change from last week. Good Western brands in small lots are quoted by jobbers at 4⅜c. to 4½c. per lb. The demand is of very limited proportions. St. Louis advices report an inactive tendency in that market with no change in prices.

Sheet Zinc.—The demand for Sheet Zinc is about of average volume. Jobbers quote 600-lb. cask lots at 6¾c. per lb., and smaller quantities at 7¼c.

Antimony.—There has been no change in this market. Hallett's and U. S. in small lots are quoted at 8¼c. to 8¾c., and Cookson's at 10¼c. to 10¾c. per lb.

Nickel.—The market is unchanged, small lots being quoted at about 55c. to 60c. per lb.

Aluminum.—The demand for Aluminum continues active and prices remain at the level they have held for a long time past Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—There is nothing new to report in this department. A regular routine business with large consumers is being done by the American Tin Plate Company in contracts covering the first half of the year. Jobbers report a fairly active demand from the smaller consumers, which is, however, of a strictly hand to mouth character. Prices are without change. American Besemer Coke Plates, IC, 14 x 20, in small lots, delivered at New York and corresponding points, are selling at about $4.80 to $5.05 per box. A further advance of 6½ pence in the price of Welsh Plates was reported this week.

Sheets.—On account of the Steel situation it would not be surprising if there should be a material shortage in the supply of Sheets early this spring. Of course there is plenty of Sheet capacity, but the fact remains that the mills, and especially the independent concerns, are having great difficulty in getting Billets and Sheet Bars, and a number of mills are being seriously hampered in operation at the present time on this account. It does not look as if the supply of Steel will be much better within the next six months, and for this reason the trade anticipate the probability that a serious shortage in Sheets may develop before long. This has caused a decided stiffening of the market on Sheets. A large number of orders are being placed for delivery the second quarter of the year. Orders that have been held in abeyance seem to be coming forward in view of the threatened shortage. Jobbers' quotations are firm and without change, No. 27 One Pass Cold Rolled Soft Steel Sheets rule at about 3.90c. to 4c., and Galvanized Sheets at 67½ and 5 per cent. to 70 per cent. off the list.

Chicago advices are as follows: The mills are far behind in filling orders. The best delivery now named is 60 days. Quite a good demand is noted for both Black and Galvanized Sheets. Small lots of Black Sheets are selling at 3.35c. to 3.45c. Galvanized Sheets are the subject of continued sharp competition among jobbers, with the usual price 70 and 5.

Old Metals.—An extremely active demand is reported for Scrap Iron, and prices on this material have stiffened. Old Brass and Copper are also in good demand, but

prices are scarcely as high as a week ago. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10½c.
Light and Tinned Copper	per lb. 8¾c.
Heavy Brass	per lb. 8¾c.
Light Brass	per lb. 6¼c.
Lead	per lb. 3⅝c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 3 c.
No. 1 Pewter	per lb. 15¾c.
No. 2 Pewter	per lb. 8 c.
Tin Plate Scrap, per gross ton	to $5.00
Wrought Iron Scrap, per gross ton	$12.00 to 12.25
Heavy Cast Scrap, per gross ton	11.25 to 11.75
Stove Plate Scrap, per gross ton	9.50 to 10.00
Burnt Iron, per gross ton	6.00 to 7.00

THE PIG IRON MARKET.

New York.—A few good sized lots have been placed in this market during the week, and there has been quite a run of moderate sized orders for delivery to New England points. The associated Southern furnaces maintain their attitude of conservatism and continue to quote $12 for No. 2, Birmingham. The January deliveries of Foundry Iron on the part of the Southern furnaces were nearly 50 per cent. greater than the make of that month of Foundry grades. We quote for Northern Irons: No. 1, $17.65 to $18; No. 2 X, $16.75 to $17.25; No. 2 Plain, $16.15 to $16.50; Tennessee and Alabama brands, No. 1 Foundry, $16.25 to $16.75; No. 2 Foundry, $15.75 to $16; No. 1 Soft, $16.25 to $16.75; No. 2 Soft, $15.75 to $16; No. 3 Foundry, $15.25 to $15.50; No. 4 Foundry, $14.75 to $15.

Chicago.—The supply of Pig Iron is exceedingly short for the first half of the year. The pressure is strong, not only for more Iron for shipment in the spring months, but also for more rapid delivery on contracts. An advance of 50c. to $1 per ton can easily be obtained on any Iron that can be delivered prior to July. Transactions during the week have been heavy. We quote as follows:

Lake Superior Charcoal	$20.00 to $21.00
Local Coke Foundry, No. 1	16.50 to 17.00
Local Coke Foundry, No. 2	16.00 to 16.50
Local Coke Foundry, No. 3	15.50 to 16.00
Local Scotch, No. 1	16.50 to 17.00
Ohio Strong Softeners, No. 1	19.50 to 20.00
Southern Silvery, according to Silicon.	16.90 to 17.15
Southern Coke, No. 1	16.40 to 16.65
Southern Coke, No. 2	15.65 to 15.90
Southern Coke, No. 3	15.15 to 15.40
Southern Coke, No. 1 Soft	16.40 to 16.65
Southern Coke, No. 2 Soft	15.65 to 15.90

Philadelphia.—Never in the history of the Iron trade have there been such conditions as prevail to-day. Everything appears to be so closely taken up that there is practically no Iron for sale. Open prices are discarded at present. February shipments of No. 2 X Foundry have been sold as high as $18, and some large lots for deliveries extending through the summer months have been taken at $17.25 to $17.50. The probable range of prices at this time for Philadelphia and nearby points is about as follows: No. 1 X Foundry, $18.25 to $18.50; No. 2 X Foundry, $17 to $18; No. 2 Plain, $16.50 to $17.

Pittsburgh.—The Pig Iron situation is as strong as it could possibly be and there is every indication that prices will go higher. Buying of all kinds is heavy and the supply is limited. Foundry Iron is very active, small foundries buying liberally and for extended delivery. We quote No. 1 Foundry at $17.25 to $17.50 and No. 2 at $16.75 to $17, f.o.b. cars Pittsburgh.

Cincinnati.—There is quite a good tonnage of Iron being sold, most of it covering deliveries in the third quarter and not a little for the fourth. The demand seems to strengthen rather than decrease, and some grades are commanding a premium. Prices are going up, and even the action of some of the larger interests in refusing to advance does not appear to be able to hold them still. With the exception of the continued trouble in making deliveries on old contracts there is not a dark spot on the whole situation. We quote, fo.b. Cincinnati:

Southern Coke, No. 1	$15.25 to $15.75
Southern Coke, No. 2	14.75 to 15.25
Southern Coke, No. 3	14.25 to 14.75
Southern Coke, No. 4	13.75 to 14.25
Southern Coke, No. 1 Soft	15.25 to 15.75
Southern Coke, No. 2 Soft	14.75 to 15.25
Southern Coke, Gray Forge	13.75 to 14.25
Southern Coke, Mottled	13.75 to 14.25
Ohio Silvery, No. 1	17.50 to 17.75
Ohio Silvery, No. 2	17.00 to 17.50
Lake Superior Coke, No. 1	18.00 to 18.35
Lake Superior Coke, No. 2	17.60 to 17.85
Lake Superior Coke, No. 3	16.35 to 16.85

St. Louis.—A very large volume of business has been transacted in Pig Iron since our last report, and owing to the scarcity prices are inclined to harden. Iron is at a premium for quick delivery, and even where extra inducements in the way of prices are offered it is difficult to secure material. The call is for all grades, and sales are well distributed through the list. We quote as follows, cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$15.75 to $16.00
Southern, No. 2 Foundry	15.25 to 15.50
Southern, No. 3 Foundry	14.75 to 15.00
Southern, No. 4 Foundry	14.25 to 14.50
No. 1 Soft	15.75 to 16.00
No. 2 Soft	15.25 to 15.50

CHICAGO REPORT.

Scrap Iron and Steel.—All prices are very strong. Little Country Scrap is now coming in. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$12.00 to $12.50
Machinery Cast	11.50 to 12.00
Malleable Cast	11.00 to 11.50
Stove Plate (free from burnt)	9.50 to 10.00
Burnt Iron and Grate Bars	6.00 to 7.00
Sheet Iron and Hoops	7.00 to 8.00
Plow Steel	9.00 to 10.00
Breaking Stock	10.00 to 10.50
No. 2, such as Shovels, Hoes, &c	.... to 7.00
Old Boilers—whole (Iron)	6.50 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings	10.00 to 11.00
Old Gas Pipes and Boiler Tubes	11.00 to 11.50
Cast Borings	5.50 to 6.00
Turnings	10.50 to 11.00
Horseshoes	12.00 to 12.50

Old Metals.—Business is quite active, especially in Old Copper and Brass. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	10½c.
Copper Bottoms	9⅛c.
Copper Clips	10 c.
Red Brass	10½c.
Yellow Brass	8 c.
Red Brass Borings	9 c.
Yellow Brass Borings	7¼c.
Light Brass	6 c.
Pipe Lead	3.50c.
Tea Lead	3.25c.
Zinc	2.90c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.
Aluminum	20 c.

Old Rubber.—Trade is still quiet. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6.40c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6½c.
Black Rubber	....	4 c.
White Rubber	....	8 c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—The demand is strong, with small sizes in short supply. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

A fire occurred on Sunday afternoon, February 2, in the nickel plating plant of the Stover Mfg. Company, Freeport, Ill., at their old works, resulting in the loss of the building and contents, amounting to about $6000 to $8000, fully covered by insurance. The origin of the fire is unknown, except that it may have resulted from an effort made in the morning by some of the men to thaw out the pipes used for heating the building. New machinery will be purchased and set up in the factory now being vacated by the removal of machinery and stock to the new plant, and for the present at least these buildings will be used as temporary quarters for the nickeling department. The fire affects the Hardware department of the business only and will not delay operations of the business outside of the nickeling department, and this only for a comparatively short time.

THE HARDWARE TRADE.

As the month advances there is no sign of a diminution in the demand or a weakening in the tone of the market. Business is moving along in large volume, and the selling of goods is a comparatively easy matter. There is an impression abroad that perhaps a good many will be in rather short supply before the season is over, and on several kinds of season goods manufacturers are already sold up, and in some cases are withdrawing quotations. Manufacturers are apparently experiencing less difficulty in getting raw material, but the condition of the Iron market is such as to make them apprehensive that there may be more trouble on this score when the trade gets more fully under way. Prices are without important change since our last review. Some consolidations to which we have called attention are under consideration, and the result will be awaited with interest. There is much less ground for complaint on the part of manufacturers in regard to the profits at which their goods are sold, most of them commanding prices which should be reasonably satisfactory. There is, however, a general disposition to be conservative in the matter of prices and not to make advances unless necessary. This comes largely from the general recognition of the fact that high prices developed by combinations, or under the stimulus of an exceptionally heavy demand, are apt to be the source of future trouble, as new competition is encouraged and the basis established for a reaction to a low level. With few exceptions the manufacturers are entitled to the commendation of the trade for the policy they have pursued in this regard. The matter of retail association is attracting much attention among this class of trade, as illustrated in the reports of the annual meetings which are contained in this issue.

NOTES ON PRICES.

Plumbers' Brass Work.—The condition of the Plumbers' Brass Work market is similar to that noted in last week's issue. The demand in the metropolitan territory is still inactive, and orders are reported to be very scarce. Prices are still unsettled, and show no signs of advancing.

Wrought Iron Pipe.—The impression prevails that an advance in the price of Wrought Iron Pipe is about to be announced. Judging from the heavy booking of orders which has taken place since the first of the month there seems to be ground for this feeling. It is said that the publication of the statement of affairs and conditions by the United States Steel Corporation has led many concerns to hasten the placing of their orders for Pipe and Tubing. The orders have been withheld by these concerns pending an assurance that prices had reached bottom. This assurance is evidently held to have been given.

Solder.—The Solder market is very strong in sympathy with the strengthening in Pig Tin. While manufacturers have not advanced their quotations, higher prices for Solder are looked for should the present level of Pig Tin values hold. Jobbers are quoting Half and Half Solder in small lots at 16½ to 17 cents, and No. 1 at 14 to 15½ cents per pound.

Rosin Sized Sheathing.—The current price on Rosin Sized Sheathing for building purposes is from $28 to $30 per ton in carloads delivered, the range of price depending on the point at which the paper must be delivered and the rate of freight for the particular territory. There is, however, some diversity in current quotations, as for example: A prominent Pennsylvania house quote $27 per ton, f.o.b. their works, York Haven, Pa., for rolls containing 500 square feet, weighing 25, 30 and 40 pounds per roll. Other quotations from concerns making competitive goods are $28.40 per ton in carload lots, New York delivery, while still another company, with works in Pennsylvania, name $29.50 per ton, f.o.b. works, in carloads, 60 days, or 2 per cent. discount 15 days.

Wire Nails.—Unfavorable weather for outside work has affected the demand for Wire Nails in the New York market to some extent. The general demand, however, has not been lessened by the recent advance of 5 cents per keg. Manufacturers report it indeed to be exceedingly active, but some mills are experiencing difficulty in securing a sufficient number of cars to make prompt shipments. The market is strong. Small lots from store, New York, are quoted at $2.25 to $2.35.

Cut Nails.—The market is firm at the recent decline of 10 cents per keg for Cut Nails. In some sections the difference in price between these and Wire Nails has stimulated the purchase of the cut. The local demand for Cut Nails is moderate, and small lots from store are quoted at $2.20 per keg.

White Lead.—White Lead in Oil is showing an improvement in the demand. The advance in the price of Pig Lead has had the effect of stiffening the market, and the possibility of a further advance in the raw material has stimulated buying. Quotations are unchanged. White Lead in Oil is quoted in moderate sized lots at 6½ to 6¾ cents per pound.

Cordage.—Rope continues comparatively light in demand, although there is considerable going from the factories in small lots. Manila Rope has stiffened in price during the week.

TRADE NOTES.

The Mfg. & Selling Company of America, with principal office at 122 Roseville avenue, Newark, N. J., have been incorporated with a capital stock of $500,000 to manufacture Iron, Steel, Zinc, &c. The incorporators are: Thomas J. Molloy, Willis G. Townes, C. P. Anderson and Samuel M. Green.

Daniel W. Baker, Jr., head of the firm of Baker & Co., Platinum Refiners and Metal Smelters of Newark, N. J., was struck by a trolley car in that city and killed on February 8, aged 40 years.

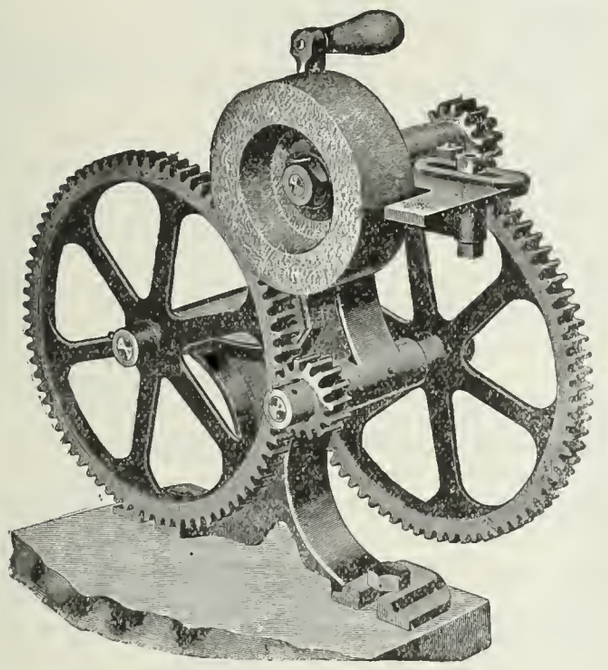
The Newport News Ship Building & Dry Dock Company, Newport News, Va., have purchased the Caskey brass foundry, in that city, which has been idle for about a year, and will put it in operation.

The American Brass Foundry Company of Hyde Park, Mass., have been incorporated with a capital stock of $7000 by A. H. Brainard, R. P. Moseley, F. H. Ambach, Cyrus Gorham, John T. McCormick and James T. Scully.

The Townley Metal & Hardware Company, Kansas City, Mo., have increased their capital stock from $100,000 to $500,000.

The Acme Metal Mfg. Company of Chicago, Ill., have been incorporated with a capital stock of $20,000 by E. C. Moran, R. Otto and W. C. Peters.

McKenna Brothers Brass Company, Limited, Pittsburgh, manufacturers of fine Brass Work, have recently bought some ground adjacent to their new works, which will be used at some time in the future for material extensions to their present plant.



An amusing instance of "red tape" is reported from London, in the case of a coroner's inquest which has just been held in that city over a Peruvian mummy. The mummy was shipped to an English museum, and the case was opened by a customs officer, who became disturbed at the appearance of its contents and notified the authorities. The coroner held an inquest, when the following verdict was returned: "That this woman was found dead at the Railway Goods Station and did die on some date unknown and in some foreign country, from cause unknown. No proofs of violent death found and the body has been dried and buried in some foreign land, probably sundried and cave buried. The jurors are satisfied that this body does not show any recent crime in this country, and that the deceased was unknown and about 25 years of age."

United States Consul Atwell of Roubaix, France, reports that an international exposition will be held in the city of Lille between the months of May and September, 1902. It will embrace the following classes: Instruction, works of art, liberal arts, general machinery, electricity, civil engineering, transportation, wheels, automobiles, sports, agriculture, horticulture, forestry,

hunting, fishing, foodstuffs, mines and metallurgy, decoration, household furniture and accessories, yarns, dress goods, clothing, varied industrles, chemicals, sound economy, hygiene, colonization, materlal and export products, special applicatlon of alcohol as a motive force and for lighting and heating. The office of the exposltion is 35 rue National, Lille.

The Gem Shop Grinder No. 3.

A new emery grinder has just been brought out by the Chicago Wheel & Mfg. Company, 39 to 45 West Randolph street, Chicago, Ill., as herewith illustrated. It is designed for use in shops in which power is not available, and has been so constructed as to enable as much work to be done by hand as would ordinarily require considerable power. The manufacturers claim that with it as much work can be done in 15 minutes as an ordlnary grindstone would do in an hour. The wheel used in this machine is of solid emery and is 5 inches in diameter by 1½ inches thick. It is cupped on one side to afford a means of accurately grinding straight edges or surfaces, ordinary grinding being done on the face of the wheel. It is provided with a rest, which affords a support for the tool or other work, enabling the operator to grlnd accurately. The shaft on which the stone is mounted runs in a babbitted box, whlch is made in two parts, so that it may be rebabbitted when worn. The collars holding the stone in place are accurately machined to lnsure the stone running true. It is geared to a ratlo of 30 revolutions of the stone to one of the crank, whlch enables a very high speed to be reached, the average revolutions per minute being easily 2800. The dlameter of the circle described by the handle is 14 inches. The size of the large gears is 10 inches by ¾ inch, and of the small gears 2 inches by ¾ inch. The dlmenslons of the machine are 15 x 17 x 12 inches, and its weight ls 30 pounds.

The Gem Shop Grinder No. 3.

Galvanic Coloring of Metals.

In an abstract by *Lightning* of an article in *L'Electrochemie* on the coloration and protection of metals, a large number of receipts are given. Gilding on steel is imitated by galvanically coating with copper from cyanlde bath, then with a thin film of zinc. After drying and polishing, thc article is heated in linseed oil to 320 degrees F., when it is stated that the surface becomes of a red brass color, as if there had been a real alloying of the copper and the zinc. Iron can be protected from rust by a layer of molybdenum, deposited from a bath containing 1 gram of ammonium molybdate and 15 to 20 grams of ammonium nitrate per liter, with a current of 2 to 5 amperes per square decimeter. All varieties of iron can be covered with an adherent and unalterable deposit of peroxide of manganese by making them anodes in a bath containing about 0.05 per cent. of manganous chloride or sulphate, with 5 to 25 per cent. of ammonium nitrate, the bath being cold, the cathodes of carbon, using a weak current of 1 to 2 amperes. Selenite of copper is rccommended for coloring iron and steel brilliant black or blue-black, according to the strength; the layer, after firing, is very permanent. The bath is made with selenious acid, 6 to 10; copper sulphate, 10; nitric acid, 4 to 6, to the liter of water. It can be also used for copper and brass with feeble currents. Mathey colors watch hands and other small metal articles with gold or platinum, but not with silver, by placing them on an anode plate under about 3 cm. of solution, and dipping the cathode into the liquid over them until the required tint is produced.

THE new galvanizing works of the Lalance & Grosjean Mfg. Company that are being erected in connection with their factory at Woodhaven, L. I., are now under roof and are only waiting for some of the galvanizing pots before they are started. It is expected that the new department will be in operation next month.

THE DAYTON. THE GEM.

Patent Pending.

Iwan's Perfection Wire Conductor Pipe Hanger.

Best Hanger Ever Invented.

Why It Is The Best:

1st. It holds pipe one inch from building to permit painting.
2d. It looks ornamental.
3rd. It can be used for frame or brick buildings.
4th. It can be used for round or corrugated pipe.
5th. It completely encircles the pipe, holding it firmly on all sides
6th. It is strong and durable.
7th. It is cheaper than any other hanger.
8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe 2½ inch hanger is required. Other pipe runs uniform.

Also Manufacturers of Iwan's Chimney Top.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.
Materials Used in Galvanizing.

BERGER'S "Classik" METAL CEILINGS

Did not come by chance, but were the result of forethought, enterprise and effort. We realized, in a measure, at the outset, the importance of the undertaking, but as the work progressed its scope grew larger and larger until it was far beyond the original limit.

The outcome enables us to offer what is by far the largest and most artistic assortment of metal-ceiling designs ever placed upon the market.

To accomplish this has required years of persistent and expert effort, but that effort has been fully justified by the results.

It has placed our line far in the lead and has opened for it a field of usefulness once considered unattainable for this material.

Berger's "BERGER'S Classik" TRADE MARK METAL CEILINGS **Metal Ceilings**

combine the artistic effect of plastic relief with the mechanical excellence and staying qualities of sheet metal.

Wide-awake dealers who appreciate the advantage of handling high-art goods should get in touch with the high-art line we offer

Berger's *"Classik"* Metal Ceilings win orders where the general run of stamped material would utterly fail to receive consideration.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials —13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections) —325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.

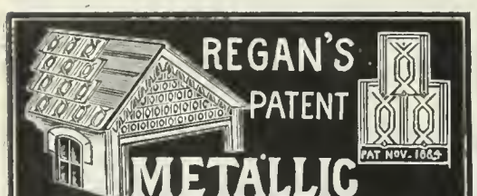
New in Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.
This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.
The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.
Ask us about it. We gladly furnish information and price on request.



THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

Makers of the **KEENE CORNICE BRAKE.**

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

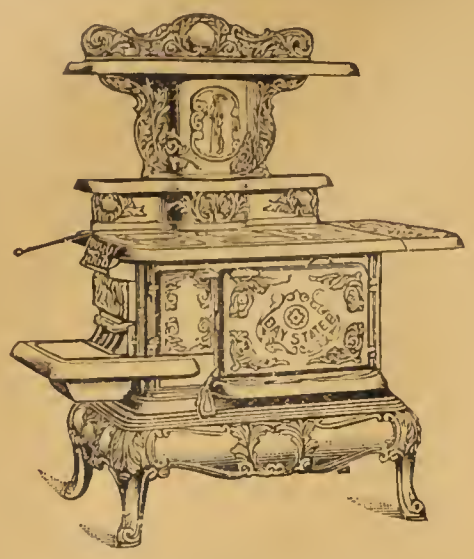
My soul and made me quiver.
'Twas wondrous strange. I swear I saw
A shad roe up the river!

—*Exchange.*

—UNSAFE COMBINATION.—"This is our latest novelty," said the manufacturer, proudly. "Good work, isn't it?"

"Not bad," replied the visitor, "but you can't hold a candle to the goods we make."



"Oh! are you in this line, too?"

"No. We make gunpowder."—*Philadelphia Press.*

—IT WAS EMERALD.—"What kind of oil, Pat, do you suppose they use to produce that color?" asked the citizen, as a freight train went by showing a green lantern.

"Shure, I should say some of the Imerald Isle, sir."—*Yonkers Statesman.*

The New Bay State "B"

Will be the leader in **Range Society** the coming season.

It is artistic, thoroughly modern and right up to the minute in improvements of merit.

QUICK MEAL
Gasoline Stoves

"Quick Meal" Evaporating Stoves, with their German Silver valve points and their indestructible burner drums, have stood the severest of tests.

"Quick Meal" Evaporating Burners, with their subflames, have proved themselves to be the only successful evaporating burners in use.

"Quick Meal" Evaporating Stoves, with their late designs, their large assortment, their simple and durable construction, are the stoves that will build up a good trade and increase your business.

"Quick Meal" Giant Burner Stoves are easy to regulate and easy to repair, as they have the well-known "Quick Meal" Lever Valves.

"Quick Meal Junior" stoves also use the "Quick Meal" Lever Valves and are in every way worthy of the name "Quick Meal."

A well-assorted line of "Quick Meal" Gasoline Stoves will give you the largest variety and the easiest selling line of Gasoline Stoves on the market.

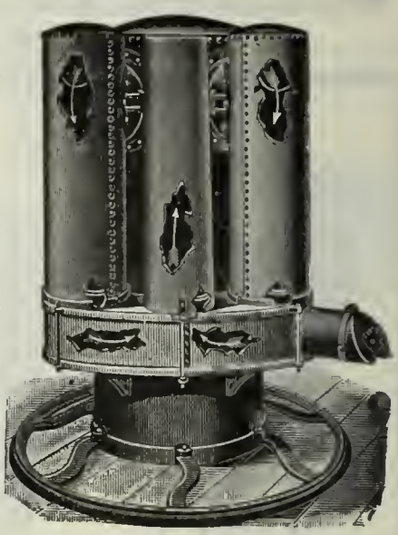
Some Ripe Experience



Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand, we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The *American Furnace* is made for the better class of trade; is durable, clean and economical in fuel.

THE GRAFF FURNACE CO.

208 WATER STREET, NEW YORK.

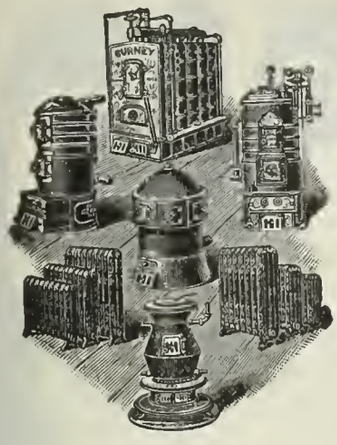
WORK WELL DONE AT LITTL ECOST.

SOMETIMES

a furnace costs little but makes up the cheapness in the quantity of coal it consumes; sometimes a furnace costs a great deal and the extra cost is made up by the saving of the fuel; sometimes a furnace costs a moderate price and does the work well and saves fuel.

A FURNACE

of the latter class is shown herewith, and our catalogue shows it more thoroughly.



Here is the experience of one man with this style of furnace:

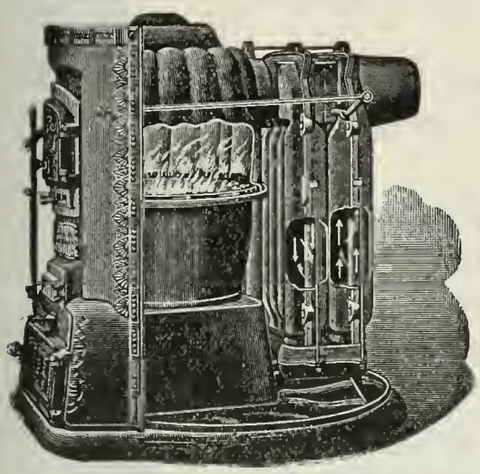
L. J. CLARK, Villas, Pa., says:

"I want to tell you how my furnace acted one winter. Down stairs I heat 3 rooms and pantry and hall, using a gasoline stove for cooking; up stairs, I heat 3 bedrooms, bathroom and hall, and also have one register in attic which was used occasionally, making in all 10 registers. I moved into the house on the 4th of November and had fire up to the 5th of May. I bought eight tons of soft coal at $1.80 per ton, total $14.40. I had about 1¼ tons left over. We had loads of hot water heated in furnace, so that fuel for gasoline stove only cost about $2.10. This looks rather small for expense, but nevertheless it is a fact."

GET OUR CATALOGUE AND PRICES.

GIBLIN & CO.,
UTICA, N. Y.

Even members of the same family are not always alike in virtue or ability, yet the



Gurney Heaters

Are of uniform excellence. In all of them the heating surfaces are so arranged as to produce a maximum of heat from a minimum amount of coal.

All are made from the best grades of iron, have the most efficient types of grates, and embody all the latest improvements. "Bright Idea," "Doric," and "400 Series" Steam and Hot Water Heaters are thus equipped. Sales of any of them will enhance your reputation. Would you become an agent? Let us hear from you.

Gas Ranges, Furnaces, Stoves, Ranges and Repairs.

HENRY N. CLARK CO., 56 and 58 Union Street, BOSTON, MASS.

If You Build a Bonfire

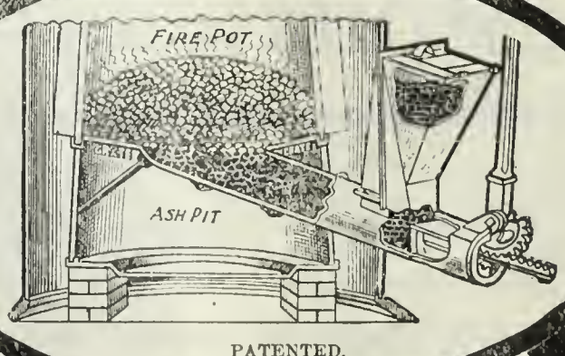
you will notice that a big share of the heat produced rises straight up into the air. Burning brands and live cinders, etc., take wings, also. Every atom of this flying matter contains valuable heat.

The ordinary furnace is a big improvement on the bonfire, but there is a similarity. Volumes of smoke and gas escape, which mean good heat wasted.

The Peck Williamson Underfeed Furnace stops all this. It compels the gases and smoke and combustion products of the coal to circulate up through a live bed of coals.

They are therefore consumed, practically every heat unit extracted, not wasted up the smoke flue.

You can't get around the fact that a furnace like that will save coal every minute it is running.



You can't deny that a furnace like that will get more good out of the coal.

You haven't a customer who can conjure up a solitary argument against the Peck-Williamson Underfeed Furnace.

We are anxious to prove to your satisfaction every claim we make. Our claim is remarkable. This furnace is remarkable. Send for our new booklet to-day.

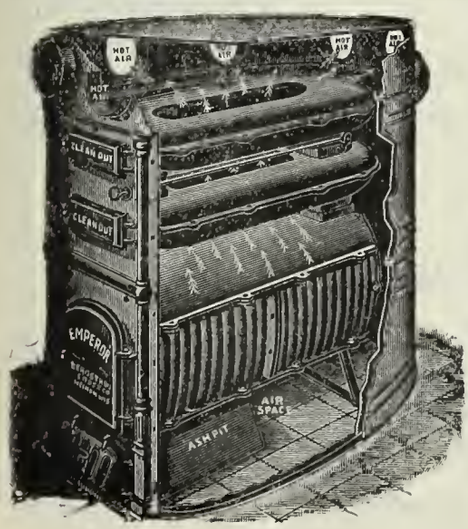
THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst. is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.



Yours very truly,
ROBINSON-HUGHES & CO.

SEND FOR CATALOGUE.

Bergstrom Bros Co.

NEENAH, WIS.

They regulate heat in residences, offices, stores, mfg. plants. Guaranteed.

The Howard Thermostat Co.

West Water Street, Oswego, N. Y.

No electricity or compressed air. Simple as a heavy spring motor can be.

Would like to send you their catalogue and give a few reasons why you should sell their Heat, Valve, Draft and Damper Regulators. This should be an interesting topic. We have the most simple thermostat made; also the most sensitive. Only three parts—a sensitive and powerful sensitive plate, a heavy spring motor made of brass, and common pulley connections. Just enough material to do the work satisfactorily, but not one atom too much. They do "straight work," without the aid of outside agencies. No other thermostat on the market can do more with all of its electricity and compressed air connections.

THEY SAVE THE COAL

WHICH IS WASTED BY THE WRONG OPERATION OF FURNACE OR BOILER DAMPERS.

The FORBES FURNACE.

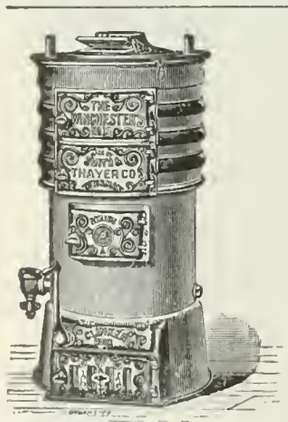
You run no risk in putting in the

Forbes Furnace.

When properly installed we guarantee them in every case.

They are constructed entirely of cast iron.

No sheet iron drums.



Our radiating tubes are ⅛ in. thick, and will wear for years.

Specially suited for low cellars.

THE METROPOLIS SHEET METALS AND STOVE REPAIRING CO.,
261-261½ Springfield Ave., Newark, N. J.

'I have spoken of the 'DIGHTON' to many people and shall continue to mention it, for it has been very satisfactory and requires considerably less fuel than other Furnaces I have used."

We have on file hundreds of letters testifying to the little fuel that is required in a "DIGHTON."

As a great number of them compare fuel consumption, and state the name of the Furnace in use before, it is fair to suppose that these people are in a position to judge intelligently.

With a few exceptions these letters are unsolicited.

When you sell your customer a "DIGHTON," tell him "It's an excellent article at a fair price." You don't have to tell him a "cock and bull" story to explain the extra you are obliged to charge for some other Furnace having a massive front and extensively advertised name.

After your customer uses it, if he doesn't recommend it to his neighbors, let us know about it.

— ANSWERED DESCRIPTION. — "That new reporter must be a humorist."

"How so?"

"Why, when the editor told him he would expect him to furnish a double headed article he came lugging in a barrel and said that was the only one he could find."—*Philadelphia Bulletin.*

— THE RETORT COURTEOUS.—"No, I have nothing for you," said the housekeeper sternly. "And don't you come here after dinner again."

"Beg pardon, lady," replied Hungry Hawkes, "but I didn't suppose you'd have dinner over dis early in de day. You ain't very stylish, are yer?"—*Exchange.*

— THRIVES ON WEALTH.—Willie: "Teacher told us to-day that there's a certain kind o' tree that grows out o' rocks. I can't remember what it was. Do you know, Pa?"

Pa: "It's a family tree, I guess."—*Exchange.*

Common Sense Circulator AND Radiator.

A FUEL SAVER.

This heater is so simple that its superiority over all others is plain. Being open at each end, the cold air is taken in at the bottom, passing out heated at the top, producing a constant circulation unequaled by any radiator, is easily cleaned out and if necessary can be repaired by any tinner. Takes the place of a joint of pipe 6 or 7 inch, outer casing 10 and 12 inches in diameter. Made of Wood's Refined and American Russia Iron. Can be used on pipe in back of stove with any kind of fuel. It is the best heater made. Patronage of Stove and Hardware Jobbers solicited. If the house you buy of cannot supply you send direct to me. I am not looking for Department Store or Mail Order trade. Patent applied for.

The Climax

RATCHET STOCK

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight making it convenient to carry is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe takes 2½, 3 and 4 in. die, $17.00

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating oils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

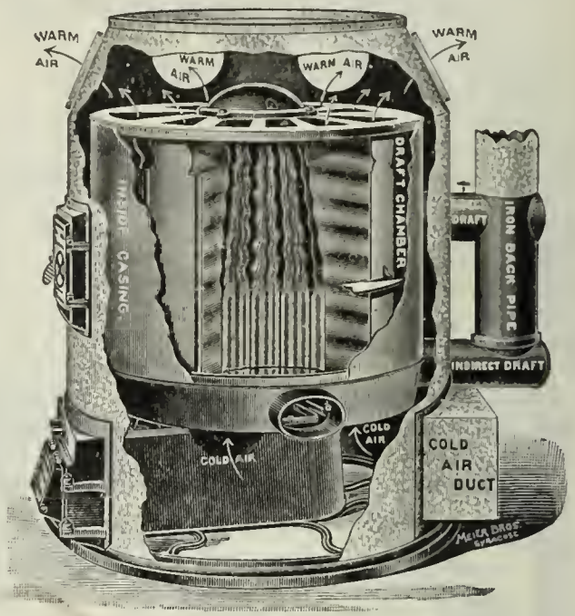
Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

SENT, POSTPAID, ON RECEIPT OF PRICE, $1.50

DAVID WILLIAMS COMPANY,
PUBLISHERS,
232-238 William St., New York.



The Kelsey Warm Air Generator.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

Ask for booklets **"KELSEY HEATING"** and **"OPINIONS."**

Index to Reading Matter.....Page 57

Steady Market for Boilers and Radiators.

The strong favor shown to a stable market in many different lines has been indorsed by the manufacturers of steam and hot water boilers and radiators. At the present time pig iron and the various manufactured articles which go into the construction of boilers and radiators all show a marked advance in price. Consequently if an advance in the price of these goods was made it would be supported by a reasonable basis. In December the manufacturers of boilers and radiators discussed some rearrangement of prices on these goods and the matter was again taken up at the January meeting, when the proposed action was ratified, and it has now gone into effect. Recently many of the manufacturers have withdrawn their prices so that the new lists and discounts might be furnished to all who are in the market for such goods and are seeking quotations. At a meeting of the manufacturers, held this week, the prevailing conditions that seemed to make a further advance in the price of boilers and radiators advisable were thoroughly discussed, and the conservative course was taken to leave prices at the point agreed upon at the December and January meetings. This conclusion has been arrived at with the view of keeping the market stable, a condition which has been found to benefit by far the greater proportion of the buying trade. This course obviates the demoralization which usually attends a fluctuating market. While the opinion seems to be quite general that an advance would be warranted at this time, the desire to avoid any of the disadvantages of a "boom" has prompted a continuance of the prices with which buyers are now familiar.

Scarcity of Fuel and Steel.

The freight car situation, which showed indications of betterment up to a week ago, has again become critical, owing to the recent cold spell, which has further hampered the already insufficient transportation facilities. Advices from Pittsburgh are to the effect that the supply of cars available for moving coal, coke and steel is lamentably inadequate, and these products are fast piling up, so that if relief is not soon forthcoming a widespread suspension of operations among the steel works, blast furnaces and coke furnaces of the district will become inevitable. Mills and furnaces are suffering seriously from lack of fuel, and the coke ovens are becoming congested by accumulating stocks which there are no means of moving. Over 2000 cars of coke are said to be standing in the Connellsville region ready for removal when the railroads can furnish locomotives, and over 200,000 tons are stocked at the ovens. The seriousness of the situation is greater than ever before in the history of the industry, and the outlook for early relief is not encouraging. Railroad officials, while doing their utmost to increase the supply of rolling stock, hold out little hope of betterment until the spring. All the iron and steel manufacturers have their books filled up with orders, many of them of a pressing nature. Consequently the situation is peculiarly embarrassing to both the producers and the consumers. The steel scarcity is becoming acute and buyers are turning to foreign sources for relief. The scarcity of steel is already beginning to have an effect upon some of the finished products; for instance, on sheets, owing to the limitation of the capacity to turn out sheet bars. Structural material, steel rails and other finished products are also showing signs of scarcity. Everything lends emphasis to the conviction expressed in many well informed quarters that prices of all iron and steel products are likely to hold their present level, if they do not move higher, for many months to come, and probably throughout the entire year. Dealers and consumers should take note and govern their purchases of supplies accordingly.

Manufacturers' Prices.

The question as to the basis on which manufacturers' prices should be arranged to the different classes of the trade is one which has often been discussed, but has never been settled. There are those who maintain that the quantity of goods purchased should determine the character of the price given, large quantities receiving a materially lower price than smaller quantities. Others have maintained that it is proper to give those who are ranked as jobbers a lower price without much regard to the quantity of their purchases, while retailers should be called upon to pay a substantial advance on such prices, also without regard to quantity. These two systems have been tried, and are being tried at the present time, and both are found to be encompassed with difficulties and objections. Indeed, to avoid or minimize these the two plans have not infrequently been combined, but even this has not succeeded in meeting the requirements of the case to the general satisfaction of the trade.

At the present time there is an apparent tendency toward a classification of the trade—dividing the distributers of the manufacturers' products into two great classes, jobbers and retailers—establishing a relatively high grade of prices for the retailers, whether large or small, and a materially lower level for the jobbers, who are often subdivided according to the volume of their business into two or more classes, between whom slight differentials in price are made. This arrangement of prices as its natural result encourages the retail trade to make their purchases of the goods concerned from the jobbers rather than from the manufacturers. It is a system which finds very general favor with the wholesale trade, and is regarded as unobjectionable by many retail merchants who are content to confine their purchases to the jobbers. One great difficulty with this

method is the impossibility of drawing a definite line between jobbers and retailers. It is, too, regarded with more or less disapproval by many of the larger retail houses, who buy in sufficient quantities to deal directly with the manufacturer and who prefer the manufacturer as their principal source of supply.

The arrangement of prices on a basis that will conserve the interests of manufacturers, jobbers and retailers alike is a question that is beset with many difficulties. It would be a matter for congratulation if some system could be found which would be satisfactory and just to all departments of the trade. Meanwhile it is desirable that manufacturers, who must look upon the problem in the light primarily of their own interests, should arrange their prices and general methods of marketing goods with a view to the interests of the distributers, both wholesale and retail.

Insufficient Postage.

A matter to which it would be well for American manufacturers and exporters seeking foreign trade to pay more attention is that of postage on letters and other matter sent to foreign correspondents and would-be customers. Complaint frequently comes from abroad of business letters from the United States being sent with short postage, involving the recipient in an unnecessary payment, not only for the shortage, but also the fine which is always imposed in such cases. One business man in Europe is cited as having reeently received in one batch of mail from the United States more than a dozen letters, only two or three of which had proper postage. One letter, which was heavy enough to require 15 cents postage on this side, bore only one 2-cent stamp, with the result that the receiver had to pay, for extra postage and fine, the sum of 32 cents. It is said to be a common occurrenee for Americans to send closed circulars to Europe and other parts of the world with 2-cent stamps, whereas they should bear at least the 5-cent international rate. Each one of such insufficiently prepaid communications involves a minimum expenditure of 8 cents by the person to whom it is addressed. Under the circumstanees it is little to be wondered at that some foreign houses beeome impatient with American methods of seeking business when they are conducted on the inconsiderate lines above indicated. Such remissness certainly does not tend to put the would-be foreign customer in the proper frame of mind to give favorable attention to the circular or other communication inclosed in a package on which he has been heavily taxed. American manufacturers and merchants who have occasion to mail communications to other parts of the world should be careful to see that the proper amount of postage is affixed thereto. It is quite reasonable to suppose that failure in this respect may often have cost the sender a good order. That negligenee of this kind is not confined to foreign correspondence is a matter of common experience among the business men of this country, for the payment of taxes on mail matter received without sufficient postage amounts to a substantial sum yearly in the accounts of many large houses. But the difference to be paid is much larger on insufficiently stamped matter sent abroad, by reason of the higher rates of foreign postage.

Explosions from Accumulated Gas.

It is improbable that more gas escapes during the winter season than during the summer; but during the winter season the basements of buildings through which the gas mains run are kept practically sealed, whereas they are open in the summer with a free circulation of air, so that there is seldom a sufficient accumulation of gas to be either offensive from odor or dangerous in amount. The recent disastrous explosion in a building in Chicago has again brought up the subject for discussion, and the propriety is suggested of the municipal authorities taking some steps to see that not only the gas piping in buildings is kept in proper condition, but also the mains of the gas companies in the city streets. Whenever there is an opening in a street, the offensive odors and the vitiation of the general atmosphere that result beyond question constitute a nuisance that should be done away with. The menace to life and property is greater, however, from the leaks in gas mains in buildings, and steps should be taken to prevent the recurrence of such disastrous explosions and fires as have occurred in different cities from time to time from this cause.

Editorial Notes.

A paragraph in the final report of the United States Industrial Commission submitted to Congress this week contains some suggestive information illustrating the wastefulness of strikes. The Commission state that, as nearly as the United States Department of Labor can reach the facts through its investigators and statisticians, the aggregate loss of wages to employees, as the result of labor disputes, in the twenty years from 1881 to 1900 inclusive, was no less than $306,683,223, or a little over $15,000,000 annually. The loss to employers during the same period from a similar cause is placed at $141,659,104, or rather less than one-half the amount lost by the striking workers. Adding these two losses together, it will be seen that the aggregate loss on account of strikes in the twenty years covered by the statistics quoted, amounts to nearly $450,000,000, or an average of about $22,500,000 annually, or nearly $2,000,000 a month. These enormous figures suggest in a most striking manner the criminal wastefulness of strikes, and provide the best kind of object lesson for the use of those who are now working for the abolition of the strike as a labor weapon, and the substitution in its place of the principle of arbitration and conciliation.

The subject of "public comfort statlons" is again being agitated in New York City, where the comparative absence of such conveniences has long been a matter of ineffectual protest. In another column is reproduced a communication on this head which recently appeared in one of the leading metropolitan dailies and which puts the thing in a rather striking light. In this matter New York is far behind all the great European cities, which make ample provision for the needs of the public in this direction. A deputation of the Women's Health Protective Association waited, a few days ago, upon President Cantor of the Borough of Manhattan to urge that action be taken by the municipal authorities for the establishment of public comfort stations throughout the city, and the President promised to appoint a special committee to investigate the matter with the view of supplying these desirable convenienees. There is, therefore, a prospect that New York may get in line with modern sanitary progress in a matter so important to the comfort, health and morals of her citizens and of the strangers within her gates.

An incident which happened recently illustrates the eagerness with which manufacturers are rushing their improvements. Unable to wait until the frost is out of the ground a company decided to put up steel buildings without putting in the foundations. As soon as conditions are favorable the latter will be put into position.

STOVE CONSOLIDATION AGAIN.

Notwithstanding that nothing authoritative has been given out by those most interested in the consolidation of the interests of a number of manufacturers of stoves, rumors to this effect are rife and persistent. The financial column of a leading New York daily is responsible for the statement that reports from Reading, Pa., indicate that steps are being taken to form a combination of stove manufacturers with a capital of $40,000,000. If this rumor is correct it is a corroboration of the report current a short time since, that a consolidation of stove manufacturers was to be effected in the East that would rival that in the West, which is said to be ready for announcement on March 1. With a rising material market and keen competition a consolidation of the magnitude reported would have a very strong influence against the demoralization of prices and other evils from which the stove trade has been suffering, provided the influence was exerted in that direction. With these rumors comes the report that some of the older and most successful men connected with the leading stove houses in the West desire to retire from active business, and are willing to turn over the labor of conducting these anticipated large enterprises to younger and more vigorous men who are qualified to carry them forward successfully.

THE STOVE AND FURNACE INTERESTS AT THE ILLINOIS HARDWARE CONVENTION.

The stove and furnace trades were well represented at the fourth annual meeting of the Illinois Retail Hardware Dealers' Association, held at Decatur on the 12th and 13th inst. Quite a number of representatives of these trades made exhibits of their specialties in rooms in the St. Nicholas Hotel. Taken collectively, the display thus made was perhaps one of the largest ever shown in connection with a retail hardware convention.

The M & D Range Company, Chicago, pioneers in the manufacture of wrought iron and steel ranges, exhibited three samples. These consisted of one of their standard M & D ranges, their new American steel range and a combination range for the use of both gas and coal. This company were the first to enter the field with a combination range, and although at the beginning much difficulty was experienced in finding customers who would appreciate it, they persevered and eventually built up a large trade. This branch of their business is now so satisfactory that they find such improvements as they introduce eagerly followed by their customers. The combination range shown on this occasion was a strikingly attractive piece of work, being finished with numerous nickeled trimmings, and having a rolling top made of polished steel placed over the cooking holes. This top forms a canopy to be used for drawing off odors when cooking. The exhibit was in charge of J. H. Farquharson.

The Wireton Heating Company, Blue Island, Chicago, exhibited a sample of the Wireton draft regulator, which consists of a clock arrangement by which the opening and closing of a furnace or boiler draft can be arranged for a particular time, thus enabling the draft to be opened early in the morning without the necessity of personal attention. The company further exhibited a line of hot air registers and distributed literature descriptive of their extensive variety of hot air furnaces. The exhibit was in charge of George D. Hoffman, who issued a clever card calling attention to his specialties.

B. C. Millington, representing Taplin, Rice & Co. and May & Fiebeger, both of Akron, Ohio, exhibited the Modern Climax steel range and the Climax hot blast heater, manufactured by the former firm, and distributed catalogues of the Akron air blast furnace made by the latter. He distributed lead pencils advertising the Climax line of stoves and ranges.

The Joliet Stove Works, Joliet, Ill., made an exhibit of five samples of their specialties. The company are originators of steel cooking stoves, which are now being made by so many stove companies. A steel stove was, therefore, a prominent feature of the display. They are also originators of Moore's air tight stove for soft coal, which likewise proved so well adapted to this purpose that the principles of its construction have been adopted by other manufacturers. The company further displayed two steel ranges, one of which is the new Premium range, which they have just brought out and which is a handsome piece of work, representing the most modern ideas in range construction. The heaters shown comprised one of their Moore's air tight stoves for soft coal and an air tight oak hot blast. The latter recently has been brought out by the company and is already meeting with great success. This exhibit was in charge of J. H. Sawyer, Jr., E. H. Mitchell and Carl Phillips.

The Art Stove Company, Detroit, Mich., made quite a large exhibit of their Laurel line of stoves and ranges. The samples shown comprised four steel ranges and two heating stoves. A peculiarity of the range exhibit was the fact that four different sizes were shown of the Twentieth Century steel range, all made on the same principle, but finished differently to conform to the requirements of consumers. These ranges have the company's peculiar flue construction. Instead of being made with a sheet flue, according to the construction usually followed, they have two flues. By the arrangement of two flues underneath the oven, one for down draft and the other for up draft, the heat is evenly distributed, which is claimed to prevent the oven bottom from warping and to secure even baking. The top is also constructed with two flues, which causes the flame to be deflected over the entire top of the stove before passing to the smoke pipe, thus enabling all the cooking holes to be evenly heated. This is an improvement over the old direct draft, which only heats the two front holes. The heating stoves shown were samples of the Twentieth Century Laurel soft coal heater. This heater has a slotted fire pot, enabling a hot air blast to be evenly introduced by means of the slots into the fire pot, thus securing perfect combustion of fuel. These heating stoves are beautifully finished, the shape and decorations conforming to the most modern type of high grade square base burners. George H. Fowler, who was in charge, distributed nickel plated Carrie Nation hatchets as souvenirs.

The Auer Register Company, Toledo, Ohio, exhibited samples of the side wall register brought out by the company a short time back, which has proved exceedingly popular in the hot air heating trade. This side wall register is designed to take the place of the ordinary floor register, and its arrangement is such as to discharge into a room as large a volume of air as a floor register of equal capacity, thus avoiding cutting holes in the carpet and other objections which are held against floor registers. The inventor, George S. Auer, who was in charge, fully explained the merits of his device.

A. C. Selleck, Chicago, exhibited one of his Common Sense fuel savers, which consists of a completely new type of drum or radiator to be attached to a stove pipe. This radiator heats by circulation, as it consists of a number of vertical flues through which the air is drawn from the floor and discharged at the top after being heated.

The Brand Stove Company, Milwaukee, Wis., decorated the watch chains of the members with a gold plated medal, bearing the name of the company and their trade-mark. They were represented by W. B. Lyman and C. L. Franklin.

The Majestic Mfg. Company, St. Louis, Mo., distributed artistic aluminum pin trays. The company's representative was Carl Sommer.

The Estate of P. D. Beckwith, Dowagiac, Mich., manufacturers of Round Oak stoves and furnaces, distributed nickel plated match boxes, having a representation of a Round Oak stove on one side and the famous Indian, Doe-Wah-Jack, on another side. They also gave out stick pins bearing a Round Oak stove so neatly stamped out in sheet metal that it made quite an attractive decoration. They were represented by J. O. Becraft and Robert R. Elliott.

F. F. Porter, Chicago, distributed catalogues of the

Porter warm air furnace, which he manufactures and which is made in four sizes, suitable for coal, coke or gas.

The Peninsular Stove Company, Detroit and Chicago, distributed leather covered memorandum books containing maps of the United States and its foreign possessions, with other useful information. W. T. Whiffen and J. B. Wilson represented the company.

Other representatives of the trade present on this occasion included the following:

John F. Parker, Schneider & Trenkamp Company, Cleveland and Chicago.

John Le Page and Frank S. Hawken, Bridge & Beach Mfg. Company, St. Louis, Mo.

A. Corson, Black & Germer, Erie, Pa.

John C. Buckley, George M. Clark & Co., Chicago.

C. R. Graves, Detroit Stove Works, Detroit, Mich.

James Fentress, Jr., and C. C. Kelley, Cleveland Foundry Company, Cleveland and Chicago.

C. A. Woolley, Cole Mfg. Company, Chicago.

Charles Smith and John V. Patten, Charles Smith Company, Chicago.

WHAT SHOULD A FURNACEMAN KNOW?

BY INDEX.

There are many things that a furnaceman should know, and I am not surprised that "J. K.," in his original article on this subject, has, in the opinion of "C. A. H.," omitted one thing. For the benefit of whoever may be interested, I would say that for ten years I have been cutting from *The Metal Worker* special articles on the different subjects interesting to a furnaceman. These I have kept in a box letter file, which is indexed, and I find under the head of "Air Filters" a description of one of these devices in *The Metal Worker* of April 27, 1895. This consisted of a frame to be covered with cheese cloth to be inserted obliquely in the cold air duct. The area of the frame was about four times the area of the cross section of the cold air box. This was to present so much surface of cheese cloth that it would not especially retard the flow of air. This frame could be withdrawn to have a new piece of cheese cloth attached, or the one in use dusted.

A dust collector was shown in *The Metal Worker* of October 27, 1894, consisting of a series of baffle plates, which would break the force of the entering air current and allow the dust to collect. In *The Metal Worker* of March 14, 1896, was a description of an apparatus for washing, drying and heating the air in the Chicago Telephone Company's building. In the issue of October 10, 1896, the air supply filter used by John P. Schaffer of Pittsburgh was illustrated and described. This consists of a series of frames covered with cheese cloth arranged to be removed for cleaning or renewing. In this device the cheese cloth did not cover the entire frame, but left a space so that air could pass through the frame at one end. These frames have an opening left alternately at opposite ends and serve as baffle plates to catch the dust, while also screening the air. A description of an air filter is given in *The Metal Worker* of October 28, 1893, in which a long piece of cheese cloth is threaded over several iron pins, so as to present a large surface and not interfere with the inflow of the air. This was designed to be placed in an enlargement of the air supply duct.

So much for the methods of cleaning air which have appeared in *The Metal Worker*. I hope, however, that others who have experimented along this line will send sketches and descriptions of their devices. In the section of country in which I am located it is not so necessary to filter the air as it is in soft coal districts; consequently I have had no personal experience except that of observation when traveling and visiting other furnacemen. The only drawback that is commonly reported is that unless the air filter is either renewed or cleaned frequently it will stop up and cut off the air supply to the furnace, causing the furnace to be overheated and damaged. It is generally conceded that unless the air filtering device is in the house of an intelligent person, who will superintend it, or who employs servants, whose business it is to keep the filter clean, it is more of a disadvantage than a benefit. From the different devices that I have seen, if I had occasion to use an air filter, I should favor that used by Mr. Schaffer, in which the filter does not cut off the air supply, but acts both as a screen and a baffle plate. The device, as I have before mentioned, was described and illustrated in *The Metal Worker* of October 10, 1896.

LACK OF PROFITS IN THE GAS STOVE TRADE.

BY W. R.

The fact that gas stoves are selling at less than they were three years ago, notwithstanding a general increase in the cost of sheets, wire, pig iron, coke and labor, would indicate the wiping out of the trade margin of profit quite generally. That something has happened in this line is pretty clearly indicated by the recent Western consolidation of some nine concerns making gas as well as gasoline stoves into the American Stove Company. These companies are seeking to protect themselves from mutual competition, especially in the cheaper grades, and to economize in operating expenses.

The gas stove trade is peculiar in that it is almost a monopoly, usually controlled by the local gas company. The gas companies usually start in by handling the gas stoves at either actual cost or at a positive loss—the sole object being to sell more gas, and for this purpose to get out as many stoves as possible. This clientage has clubbed down the leading manufacturers to the lowest possible selling price throughout a varied line of the cheaper grades.

During the past three years coal stoves have been advanced 30 per cent., yet the gas stove side has been cut down in the face of a rising material market to the point of a uniform loss. On top of this has come a reclassification of freight rates advancing gas stoves from third to fourth class.

Many of the largest stove companies declare that, were it not for their coal stove side they would be driven into bankruptcy. It is clear that something must be done to make the business self sustaining at least. Self protection would seem to require a 10 per cent. increase, meeting the new year's list of the steel cook stove makers, who are now talking of another 10 per cent. lift.

Reliable Gas Stoves and Ranges.

We have received from the Schneider & Trenkamp Company of Cleveland, Ohio, a copy of their 1902 catalogue of Reliable gas stoves and ranges, which they manufacture in sufficient variety to meet all reasonable requirements. The catalogue consists of 104 pages of letterpress, profusely illustrated and printed in an attractive style. This is the thirteenth annual gas range catalogue which the company have issued, and within its covers, the manufacturers state, they have grouped together a line of stoves and ranges which, through their quality and merit, have established an enviable reputation in the stove market. The company's policy always has been to progress, to introduce new ideas and improvements possessing real merit, and, by giving constant and careful attention to every detail of manufacture, to maintain the pre-eminent qualities for which their goods are famous. The gas ranges shown include sizes large and small, the former being such as to meet the requirements of hotels, restaurants and other places where it is necessary to cook food for many people. The ornamentation in many cases is exceedingly rich and effective, while the attractive features embodied are of the latest and most approved type. In addition to gas ranges, attention is given to gas laundry stoves, hot plates, nursery stoves, shop furnaces, tailors' iron heaters, high shelves, canopies, warming closets, circulating boilers, natural and coal gas burners, ovens, broilers, stew pans, waffle irons, sad iron heaters, &c. Some important points to bear in mind when ordering combination ranges are presented, together with a telegraphic code, alphabetically arranged.

A Stove Repair House.

C. C. Heath & Co., Philadelphia and Baltimore, have at their new Philadelphia store and warehouse, 136 and 138 North Second street, one of the best equipped stove repair departments in that city. The entire second and third floors of the building are devoted to repairs, over 4000 bins having been erected on these floors for the storage of castings, &c., with sufficient space left for several thousand more. Electrically driven drills and other machinery have been installed for special work, and all portions of the department are roomy and well lighted.

The company have on hand a line of stove repairs of all kinds, and to further introduce this branch of their business are making the trade an inducement by attaching to each shipment of repairs what they designate as their "Ideal Premium Tags," redeemable when returned in quantities of from five to 200; the latter quantity entitling the holder to a 1000-mile book on any railroad within that distance from Philadelphia or Baltimore. They have now in course of preparation a catalogue devoted entirely to stove repairs, which will soon be ready for distribution to the trade.

Jewel Gasoline Stoves.

The catalogue of gasoline stoves which has just been issued by George M. Clark & Co. of Chicago, Ill., covering the season of 1902, is a neatly printed affair of 32 pages, bound in paper covers, the front one of which is finished in imitation of a door, the grain of the wood being faithfully reproduced and showing the old style of wrought iron hinges with which the doors in the days of our forefathers were provided. This is the twentieth "annual greeting" which the company have issued, and within the covers of the publication attention is invited to the long list of gasoline stoves offered under the name Jewel.

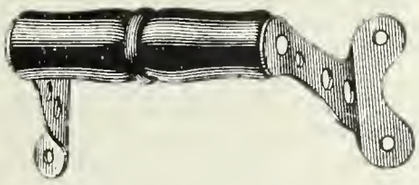
The assortment includes two new steel ranges made with and without high shelves, these being modeled after the Jewel Pressed Steel Never Break gas ranges, brought out by the company last year. To these the makers have applied the old and tried Jewel smokeless generator and similar burners to those used on their No. 85 range. They have two burners on the step so that a wash boiler can be readily heated. Other goods offered include a line of seven smokeless generator stoves, five generator stoves, seven Acme stoves and three evaporator stoves, all embodying features which cannot fail to impress the dealer. The company also offer a new circulating water heater and a new instantaneous and portable water heater, both with gasoline generator attached.

These goods, in connection with others, are illustrated and described in a way to appeal to the dealer, as well as to the user; and in connection with the descriptive text are to be found dimensions, sizes, &c. Baking ovens, burners, camp and yacht stoves, broilers, toasters, &c., are also considered. A copy of the manufacturers' guarantee is presented, as well as some valuable suggestions regarding repairs. The concluding feature of the publication is an index giving weights, prices and telegraphic code words. The matter has been arranged with a good deal of care, and gives evidence of a due appreciation of the requirements of the trade.

ODD PLATES.

The Peninsular Stove Company, Detroit, Mich., are sending to the trade a card printed in colors devoted to their Peninsular Hot Blast Furnace with a cast iron radiator. The card is principally occupied with a view showing a Furnace in a cellar and a unique method of supplying it with air.

The Weir Stove Company, Taunton, Mass., have issued a circular of their new Solar Glenwood Furnaces, for which they make strong claims. Among the constructive features may be mentioned the triangular grate, steel radiator, large ash pit door, with dust pipe carrying the ashes and dirt into the chimney, and a regulating damper of novel arrangement. The Solar steel radiator is so planned that the products of combustion must pass through a flue, which extends its entire circumference, before reaching the smoke pipe. The steel which forms the inside wall also constitutes the round chamber in the center of the radiator, thus giving a large amount of steel radiating surface, while insuring a heater of great power. The manufacturers request dealers and others interested in their specialties to write them for an illustrated pamphlet of many New England homes heated by the Glenwood.



The Cleveland Steel Range Company, Detroit and State streets, Cleveland, Ohio, are sending out to the trade a copy of an attractively printed publication of 20 pages, calling attention to the Ideal Gas Ranges, which they manufacture in many varieties. The manufacturers state that the Grand Ideal line of Ranges has been improved and new patterns have been added to the assortment. The goods illustrated and described include the Gem Ideal, a single oven Range with four top burners, and a double line burner to the oven. The Range is also made plain in two sizes and with water heater. The Grand Ideal has a single oven, and is made in two sizes in the usual modifications. The manufacturers call attention to a number of constructive features embodied in this Range, and present illustrations of the gas burners which are used in connection with them. The Grand Ideal is of handsome appearance, cast ornamentation in conjunction with nickel constituting the exterior decorations.

Samuel B. Sexton, Jr., of the firm of S. B. Sexton & Son, Stove manufacturers, of Baltimore, Md., tendered a supper to about 200 employees of the firm last week in the salesrooms of the concern. The entertainment was given in celebration of the departure of Mr. Sexton for Europe with his wife and daughter on a pleasure trip. The party sailed from New York on February 8, and will visit Southern Europe and parts of the Orient.

The Cuyahoga Stove Repair Company, Cleveland, Ohio, have secured a large building site on the Wheeling & Lake Erie Railway tracks, that city, and are having plans prepared for a foundry building 100 x 125 feet and one story high. It is to be built in such a manner as to admit of its being doubled in size in a short time.

Wash Boiler Handle.

In the accompanying illustration is shown a new wash boiler handle that is being manufactured by Berger Brothers' Company, Philadelphia. The handle is claimed to possess unusual strength, and it is made of

Wash Boiler Handle.

the best materials. The metal parts are heavily tinned, and the handle is finely finished. It is made in two styles, one for round and the other for square end boilers. The manufacturers state that they are prepared to mail a sample of the handle for inspection to any one interested, and tinware makers are specially invited to correspond with them for particulars as to prices, &c.

Keeping Windows Free from Frost.

A correspondent of the *Electrical World* tells of a new use for electric fans. "Passing along Van Buren street in Chicago," he writes, "I noticed the windows of the shops were so thickly incrusted with frost that it was impossible to tell what business the proprietor of the shop was engaged in. Suddenly, at Wabash avenue, a large, attractive looking window of a sporting goods house burst into view with everything in it as plainly visible as it would be on a bright midsummer's day, only more prominently emphasized on account of the condition of its neighbors. I noticed an electric fan in the window running full blast. I stepped in and asked

the proprietor if the fan was used to keep the window free from frost. He stated that that was its object, and that it worked splendidly. In the morning when they found the windows covered with frost they turned on the fan, and the frost was rapidly cleared off, the window remaining clean and dry all day."

THE GURNEY REFRIGERATOR COMPANY.

A thoroughly modern plant for the manufacture of refrigerators is the new factory of the Gurney Refrigerator Company, Fond du Lac, Wis. This factory takes the place of the old works of the company which was burned April 27, last year. Immediately after the fire arrangements were made to rebuild, and the first refrigerators were turned out in the new plant about October 1. The company are exclusively manufacturers of refrigerators, and give this business their entire time and thought. They are continually bringing out new ideas, and their enterprise is shown not only in the character of the goods they manufacture, but also in the design and arrangement of this new plant, which is one of the largest in the country. The capacity of the factory is now 200 refrigerators daily.

The works occupy an entire city block. The main building covers a ground space of 175 x 195 feet, part two and part three stories high. This building is solidly constructed of brick with high ceilings, all the interior whitewashed to secure abundant light, and protected by an underwriters' pump, sprinkler system, fire walls, automatic closing doors and electric alarms to guard against a repetition of their former experiences. So thoroughly protected is this building that the rate of insurance is but one-eighth of the rate in the former factory. In it all the milling, assembling and finishing of the refrigerators are performed.

The company have their own lumber mills in Wisconsin and do their own logging and sawing of lumber, so that their works cover the entire process, from the tree to the finished product. They have no large stock of lumber in the vicinity of their factory, but receive regular shipments by rail from their saw mills, and pass this lumber rapidly through the various departments.

The tracks of the Chicago & Northwestern and the Wisconsin Central railways run through their yard, and the lumber is unloaded directly from the cars on cars with low trucks and run into the dry kilns, which are in a detached building and are of sufficient capacity to hold 175,000 feet of lumber. From the kilns a car with dry lumber goes directly into the factory. No hauling is done by teams, but everything is handled by cars. In the factory the lumber first goes to the planer on the ground floor and then to other departments, where it is cut into proper widths and lengths and run through a variety of ingenious machines. All the milling or heavy work is done on the ground floor and the materials all pass steadily in one direction. Here are also great sanding machines for thoroughly smoothing the surfaces of side and front panels and doors after they have been assembled by cabinet makers on the second floor. The shavings and sawdust from the various machines are drawn through pipes passing from each machine, which are so arranged that they finally discharge this refuse into the arch of the boiler furnace, forming practically all the fuel needed. Even the sweepings from the floors are drawn into this system.

In designing this building a very large elevator was arranged in the exact center of the structure, so that the various departments might be grouped around it, making the elevator the point to which all operations would tend and thus save time and labor in passing from one process to another on different floors.

The ground floor further contains the power room, store room, machine shop and a large filing room. The power room is equipped with a Corliss engine, which operates nearly all the machinery, and a small engine, which is used for running a 300-light dynamo and the fans for hot air heating. The entire building, except the varnish room, is heated on the Sturtevant hot blast system. The exhaust steam from the engine room passes through a large coil of pipe through which air is forced by fans, one set of discharge pipes leading into the various rooms of the factory and another set into the dry kilns. The stock room is used for carrying the stock of zinc, insulating materials, nails and other articles needed in the construction of the refrigerators, apart from the lumber. The machine shop is fitted with a full equipment of iron working tools, and is used for repair work and for building special machines of the company's own design for certain classes of their work. The filing room is equipped with automatic machines for filing and setting saws.

The second floor is used for a number of departments, prominent among which is the room in which cabinet makers make the sides and doors and assemble them into box form for the outside cases. Individual glue pots heated by steam are placed at each workman's bench. This department is supplied with machines for embossing moldings for decorative work, with drills operated by flexible shafts and other interesting machines specially adapted to the class of work required.

All metal work is done on the third floor. This department is fitted with shears, folders, gang punching machines, corrugating machines and other tools for handling the metal linings and the metal for ice compartments, shelves, &c. The removable galvanized ice compartment, of which this company are the originators, has its sides made in separate pieces, each of which has a large number of holes punched along the top. These holes are all punched at one time on each sheet by a multiple punching machine, and at the same time this machine presses the sheet in shape to be formed into a box. The inside sections are made here, the zinc linings are inserted and soldered, the mineral wool and other insulating materials are inserted and the process is advanced to the stage at which the addition of the outside casing can be made. Two enameling ovens for enameling interiors of refrigerators are on this floor.

From the assembling room on the second floor a procession of boxes is steadily moving into a room called the filler room, where the first coats of varnish are applied. They next pass into a varnishing room heated by steam for the purpose of keeping it absolutely free from dust. The crating room adjoining is the room in which all refrigerators are crated for shipment, the locks and hinges being fitted on the boxes just before crating.

From the crating room an elevated passageway runs to the warehouse, which is 150 feet from the main factory. This warehouse is four stories high, has a capacity for holding 20,000 refrigerators and is located along the tracks of three separate railroad systems—namely, the Chicago & Northwestern, Wisconsin Central and Chicago, Milwaukee & St. Paul. From this warehouse all shipments are made, even local shipments being made by car instead of by wagon. This building has been constructed to be thoroughly fire proof, being built of solid stone. The offices of the company are located in a separate building erected for this purpose and handsomely fitted up. It contains five apartments admirably arranged for the convenience and efficiency of the clerical force.

All the refrigerators made by this company are constructed of hard wood in golden oak finish and have raised panels and raised carvings. The company make five lines in all—namely, the Gurney, Cold Wave, La Belle, Imperial and Enamel. They are also bringing out a glass line. The refrigerators are sold through jobbing representatives in every part of the country. A large shipment has just been made to Honolulu. The founders of the company are still active officers of the organization, as follows: C. J. Medberry, president; David Jack, vice-president; M. J. Peck, secretary and treasurer. They established the business in 1880 at Oshkosh and removed to Fond du Lac in 1881.

The Berger Mfg. Company, Canton, Ohio, are distributing a circular giving a cut and description of their Side Lift Tubular Lantern. A new feature of this Lantern is that the frame is constructed of one piece, corrugated, crimped tubes. An illustration of the Lantern gives a good idea of its general make up and attractive appearance. The company urge buyers to place their orders for these goods now, in order that they may not be crowded out later.

ILLINOIS RETAIL HARDWARE DEALERS' ASSOCIATION.

The annual convention of the Illinois Retail Hardware Dealers' Association, which was held at Decatur on Wednesday and Thursday, February 12 and 13, was probably the most interesting and important meeting of that body that has ever assembled. The convention hall was crowded when the assemblage was called to order by President Cormick. Mayor C. F. Shilling gave the visitors a warm greeting to the city and was replied to on behalf of the asociation by D. McLaughlin of Chicago.

On roll call by Secretary G. R. Lott, 93 firms were represented by members in actual attendance. The secretary then read the following list of appointments on committees:

LOCATION OF NEXT PLACE OF MEETING: J. M. Hunter, Peoria; Leon Nish, Elgin; W. J. Krueger, Chicago; L. H. Clark, Rockford; F. W. Siecke, Freeport; H. N. Murphy, Galesburg; Z. T. Miller, Bloomington; C. M. Hurst, Decatur.

FINANCE AND AUDITING: Leo Krueger, Chicago; F. B. McKinney, Rockford; D. Refior, Ottawa.

RESOLUTIONS: L. Bapst, Kankakee; Charles H. Williams, Streator; W. T. Gormley, Chicago; Geo. A. Neeb, Chicago; J. L. Hudson, Springfield.

BY-LAWS: F. F. Porter, Chicago; G. B. Churchill, Galesburg; L. M. Reeves, Peoria; J. D. Barnett, Decatur; J. H. Vawter, Salem.

NOMINATIONS: D. McLaughlin, Chicago Wm. Dittel, Peoria; R. G. Schuerer, Vandalia; Chas. McGuire, Rockford; Fred. Kurtz, Chicago.

PRESS: W. B. Costello, Chicago; H. H. Roberts, Chicago.

QUESTION BOX: D. E. Styles, Momence; J. Bellamy, Sandoval; J. L. Smith, Chicago.

WEDNESDAY AFTERNOON.

In the afternoon President Cormick read his annual address, which was received with hearty applause, and Secretary Lott read his report, showing a total membership of 230. The report of Treasurer F. F. Porter, Chicago, showed receipts during the year of $854 and disbursements of $654, leaving a balance of $199. M. L. Corey, secretary of the National Hardware Dealers' Association, was then introduced and delivered a very interesting address, dealing with the work of the national organization.

Leon Nish of Elgin and other members spoke against the Parcels Post Bill now under consideration by Congress, and advised earnest work to defeat it. H. C. Peppler of Chicago read a paper on "Co-operative Buying," which was discussed, and followed by a paper on "What of the Future?" by Z. T. Miller of Bloomington.

THURSDAY MORNING.

The proceedings began with the reading of a paper on "Local Associations," by L. H. Clark of Rockford, which was discussed by a number of the members. A paper on "Paints" was presented by D. McLaughlin of Chicago.

Mr. McLaughlin prefaced his paper with the statement that he had formerly devoted considerable space in his store for storage of Stoves during the summer, but he found that the business had many objections. The store was frequently untidy, and no matter how careful he might be there was always something missing or broken, according to the customer, when the Stove was called for in the spring. He decided to discontinue the storage of Stoves and to put in a stock of something to take the same space. After fully considering the subject he concluded to put in a stock of Paints. On investigating the matter thoroughly, and taking the advice of a Paint manufacturer, he put in a stock of $600 worth of Paints and Oils. He shortly afterward found that this was hardly enough and he now carries a stock of $900. The business is so satisfactory that he would not run a Hardware store without handling Paints. He considers that Paints naturally go with Hardware. The stock is always clean, attractive in appearance, easily handled, and yields a satisfactory profit.

Mr. Gnadt of Chicago controverted Mr. McLaughlin's position relative to Stove storage and gave his method of keeping track of the condition of a Stove when received, which avoids all trouble.

Mr. Fahey of Decatur agreed with Mr. McLaughlin, stating that extra help must always be hired to haidle Stoves on storage, and that the cost according to his experience was so great as to leave little profit.

William T. Gormley of Chicago subsequently presented an interesting paper on "Benefits of Organization," which was followed by a discussion of the builders' hardware question, which was participated in by a number of speakers.

THURSDAY AFTERNOON.

Vice-president William Bittel, Peoria, took the chair, in the absence of the president, who was engaged on committee work, and Charles H. Williams of Streator read a paper on "Mental Equanimity."

F. F. Porter, chairman of the Committee on By-Laws, recommended the following additional section, which was unanimously adopted:

Section 8. Any member who shall be in arrears one year's dues shall be dropped from the rolls of this association, but may be reinstated to full membership by paying in full all arrears before or at the next annual meeting.

Resolutions on the death of Otto Schulte of Freeport were presented by Charles H. Williams of Streator, and adopted. On motion Bloomington was adopted as the place for holding the next meeting of the association.

D. McLaughlin of Chicago, chairman of the Committee on Nominations, reported the following list:

ELECTION OF OFFICERS.

PRESIDENT, H. G. Cormick, Centralia.

VICE-PRESIDENT, Daniel Holder, Bloomington..

SECRETARY, H. L. Clark, Rockford.

TREASURER, F. F. Porter, Chicago.

EXECUTIVE COMMITTEE: H. G. Cormick, Centralia; Daniel Holder, Bloomington; L. H. Clark, Rockford; F. F. Porter, Chicago; Z. T. Miller, Bloomington; W. T. Gormley, Chicago; H. N. Murphy, Galesburg; Charles Mauer, East St. Louis; R. G. Schuerer, Vandalia; F. W. Siecke, Freeport.

INVESTIGATING COMMITTEE: G. R. Lott, Chicago; F. Giessing, East St. Louis; L. M. Reeves, Peoria; M. Fahey, Decatur; M. Seaman, Greenville.

LEGISLATION COMMITTEE: C. W. Zumbrook, Springfield; William T. Gormley, Chicago; David Riefor, Ottawa; H. G. Bagby, Tuscola; J. A. Hunter, Peoria.

The report was unanimously adopted. On motion, the secretary cast one ballot for each of the officers, and they were declared duly elected.

The Committee on Nominations also recommended that H. G. Cormick and G. R. Lott be chosen as delegates to represent the association at the next meeting of the National Association. The recommendation was adopted.

President Cormick then addressed the convention and expressed his thanks for re-election and his appreciation of the honor which had thus twice been conferred upon him. Other addresses were made by Mr. Broderick of the American Wringer Company, George D. Hoffman of the Wireton Heating Company and W. H. Bennett of the Reading Hardware Company, upon the work of the association.

QUESTION BOX.

The Question Box was then opened and a number of interesting queries were propounded and discussed. Among them were the following:

Do we favor the complicated manner of s ove manufacturers in numbering and naming their stoves, to the detriment of our business in gaining the correct name and number from our customers in getting repairs?

This question brought out quite a long discussion, in which Messrs. Bagby of Tuscola, Cormick of Centralia, Fahey of Decatur, Clark of Rockford and Styles of Momence participated. The point was drawn out that the great difficulty encountered by a dealer was to secure from his customer the correct name and number of a stove for which repairs were desired. President Cormick stated that he uses a blank, which he requires his customer to fill, and finds this method quite satisfactory.

Mr. Fahey stated that he is often obliged to educate a customer how to find the name and other necessary details to describe his stove. Records of all customers are kept, as well as the stoves for which they have ordered repairs, and this frequently facilitates business of this character.

Mr. Clark uses a card index system. These cards have blanks on them, showing all details required, and after they are filled by the customer they are deposited in a box made for the purpose, and these boxes are run in monthly series. Track is thus easily kept of the repairs in transit, and after the repairs are received the card is transferred to another box, in which it remains

on perpetual record. He found the card system much more satisfactory than a book.

Mr. Styles asked if anything had been done to induce stove manufacturers to confine themselves to collars of regular size; for instance, to 5, 6 or 7 inch instead of 5½, 6½, &c.

President Cormick said this matter was too large a question for a State association to handle and belonged to the National Association. On motion the matter was referred to the National Association.

Is it right for outside dealers to give an agent orders for stoves or any other articles to be sent to his home town for himself or friends?

Interesting experiences were brought out by Messrs. Porter of Chicago and Cormick of Centralia relative to practices of this character.

The business of the convention having been concluded, an adjournment was taken at 4.25 p.m., to meet in Bloomington in 1903.

CHICAGO DELEGATION.

Chicago contributed largely to the success of the convention, sending there a large delegation, not only of retail hardwaremen, but also of the manufacturers, jobbers, salesmen and press representatives, among the latter being:

J. O. Becraft, Estate of P. D. Beckwith
J. D. Warren, J. D. Warren Mfg. Company.
Henry J. Sawyer, Jr., Joliet Stove Works.
George S. Auer, Auer Register Company.
Geo. D. Hoffman, Wireton Heating Company.
Richard H. Gardner, Niles Mfg. Company.
W. B. Lyman, Brand Stove Company.
Evans Nelson, Lawson Mfg. Company.
James Fentress, Jr., and C. C. Kelly, Cleveland Foundry Company.
Louis A. Denoyer, J. L. Perkins & Co.
Stephen M. Perrigo, C. M. Avery & Co.
Robert Aitchison, Robert Aitchison Perforated Metal Company.
M. Brucker, stove repairs.
H. H. Roberts and Geo. W. Cope, *The Iron Age* and *The Metal Worker.*

THE BANQUET.

The local dealers of Decatur showed their appreciation of the selection of their city for the convention by tendering a banquet, which was held at the St. Nicholas Hotel on Thursday evening. A very attractive *menu* was prepared, which, together with a programme of toasts, was printed in pamphlet form, bound in tinted covers and tied with a silk bow.

R. I. Hunt of Decatur filled the exacting position of toastmaster with great credit to himself and pleasure to his hearers. C. H. Williams of Streator responded to the toast, "Illinois as a Hardware State;" H. G. Cormick of Centralia, to "Association Work in Illinois;" Hon. Owen Scott, editor of the Decatur *Herald*, to "Decatur;" R. R. Elliott of the Estate of P. D. Beckwith, to "Mutual Interests of Buyer and Seller;" John F. Parker of the Schneider & Trenkamp Company sang a baritone solo; Daniel Stern, *American Artisan*, responded to the toast, "Twentieth Century;" F. E. Bonney, Paxton Hardware Company, to "Camp Followers;" W. H. Bennett, Reading Hardware Company, to "Don't Irritate;" H. H. Roberts, *The Iron Age*, to "Power of the Press;" L. H. Clark of Rockford, to "The New Secretary;" Carl Sommer of the Majestic Mfg. Company and C. R. Graves of the Detroit Stove Works furnished a musical diversion; Geo. W. Cope, *The Iron Age*, responded to the toast, "Good Fellowship."

The banquet was attended by 150 persons.

McCray Refrigerators.

The McCray Refrigerator Company, Kendallville, Ind., are sending out a new catalogue of the McCray line of refrigerators. This is an exceptionally handsome catalogue of 60 pages, having a specially fine class of illustrations. Some of these illustrations are lithographed in colors to show the uses to which the different compartments can be put. The line comprises refrigerators made wholly of porcelain tiles, others with linings of white glazed tiles and others lined with odorless wood. The illustrations show a large number of styles of all sizes, together with illustrations and descriptions of special refrigerators, which are built to order. In some cases the refrigerators built to order have two ice chambers, thus making two distinct refrigerators in one. The company make a specialty of constructions to meet the most exacting hygienic requirements.

NEW ENGLAND HARDWARE DEALERS' ASSOCIATION.

The New England Hardware Dealers' Association held their ninth annual meeting and election of officers at the Quincy House, Boston, Mass., on February 12. At 5.30 dinner was served, followed by the election and remarks by a number of members upon "The Outlook of the Association." Owing to illness, the president, George W. Burditt, was not able to be present, and the vice-president, Sewall D. Balkam, presided. The report of the treasurer, Henry N. Sanders, showed the finances of the association to be in good condition. Secretary James A. Farless, for the ninth time, presented his annual report.

The Nominating Committee, comprising Samuel H. Thompson, Lowell, Mass.; Edward A. Loomis, Providence, R. I.; William D. Parlin, Natick, Mass., reported as follows.

First vice-president, John H. Sayward, Haverhill, Mass.
Second vice-president, John B. Hunter, Boston, Mass.
Third vice-president, E. Loring Richards, Boston, Mass.
Secretary, James A. Farless, Boston.
Treasurer, Henry M. Sanders, Boston.
DIRECTORS: D. Fletcher Barber, Boston, Mass.; Charles E. Adams, Lowell, Mass.; John M. Fiske, Natick, Mass.; E. C. W. Bliss, Boston, Mass.; Calvin M. Nichols, Dorchester, Mass.; Joseph H. Williams, Boston, Mass.

All of whom were unanimously elected for the next year.

For president, Samuel H. Thompson of Lowell presented the name of Sewall D. Balkam of Jamaica Plain. There was no other nomination and Mr. Balkam was unanimously elected. In accepting the election, President Balkam expressed his high appreciation of the honor conferred upon him and asked for the hearty cooperation of all the members. The motto of the association, he felt, must at this time be "Forward."

Those who spoke on the topic of "The Outlook of the Association" were: Anthony S. Morss, James A. Farless, Edward A. Loomis, Myron H. Tarbox, D. Fletcher Barber, E. W. Bliss, Calvin M. Nichols and E. M. Richardson.

The genial secretary of the association, James A. Farless, was the recipient of numerous congratulations upon the attainment of the seventy-fifth anniversary of his birth, which was reached on the day of the annual meeting, and in return made an interesting talk, in which he gave the members his receipt for a long life and a happy one. The president appointed E. Loring Richards and George J. Mulhall a committee for the March meeting.

Glacier and Defender Refrigerators.

The Northern Refrigerator Company, Grand Rapids, Mich., have issued their 1902 catalogue of Glacier and Defender refrigerators. This catalogue comprises 96 pages, and illustrates a large variety of refrigerators comprising all kinds of constructions suitable for domestic use, as well as special shapes for those requiring refrigerators of large capacity or of narrow width for apartment house use, grocers', butchers' and butter merchants' refrigerators, sideboard styles, &c. Features have been introduced in some of these constructions which are of a specially interesting character. For instance, the butchers' refrigerator has drawers for cut meat, fitted with bottoms made of heavy galvanized wire screens; grocers' refrigerators have roll tops made of double glass for the storage of small cheese and other articles, and the butter refrigerators have sliding trays to enable the contents to be easily drawn out. These refrigerators are both zinc and porcelain lined. A portion of the catalogue is devoted to illustrations and descriptions of the construction of the flues to secure air circulation and other details of fixtures, trap, &c.

The Illinois Roach Trap.

The patent roach trap, herewith illustrated, has recently been placed on the market by J. H. Jones, Streator, Ill. Fig. 1 shows the trap ready for use and Fig. 2 presents a view with the top removed. In form the trap resembles a 2 quart bucket with wire gauze inserted in the lid. The construction is as follows: The bottom is double, thus permitting an opening to be arranged all around the bottom edge, through which the

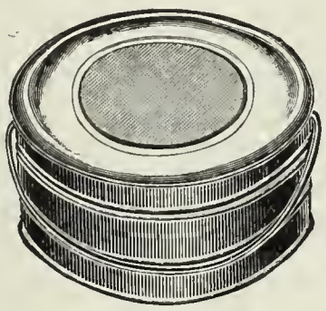


Fig. 1.—The Illinois Roach Trap.

roaches can freely pass into a circular compartment in the center. This compartment has a wire gauze bottom, below which the bait is placed in a tin cup or lid, fitting on the tin wall of the compartment. The roaches are thus unable to get at the bait and cannot return through the openings by which they entered, as these are guarded by sharp prongs. Above the prongs are openings permitting the roaches to pass from the compartment into the top of the trap. They are again unable to escape from this second compartment, as sharp prongs are also placed around the openings through which they en-

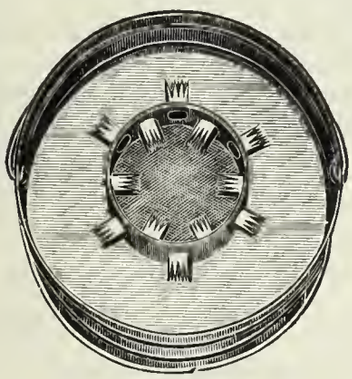

Fig. 2.—Illinois Roach Trap, with Top Removed.

tered. When a number of roaches are caught in the trap they are killed by immersing the trap in water. After the first baiting is done the trap requires no setting or further attention. It is simple in form and is very easily cleaned. The manufacturer states that in more than one instance a single trap has caught more than a quart of roaches in one night. The trap is made of either tin or galvanized iron, as desired.

Stove and Hardware Dealers.

The Enterprise Enameling Company of Bellaire, Ohio, have contracted for an additional plant, 100 x 108 feet, in which they will install all of their stamping machinery. The company's plant is now four times the size it was two years ago, their rapidly increasing trade having made a number of extensions imperative in the interval.

Lyon & Whiting, Milford, N. Y., have been succeeded by the Milford Mfg. Company, who have been incorporated to manufacture the Ball Bearing Egg Beaters and other specialties of the first named firm.

Brock & Co. are a new firm who have bought the stock of J. T. Vance, dealer in Stoves, Furnaces, Tinware, &c., at 20 West Main street, Lexington, Ky. The firm are composed of L. B. Brock, lately coal inspector for the C. N. O. & T. P. Railroad, and Prof. J. H. Connell, director of the Texas Experiment Station. Mr. Brock will have charge of the practical end of the business.

The retail Hardware dealers of East St. Louis, Ill., organized a local association on the 3d inst. All the dealers of that city are members of the association. The officers are as follows: President, Charles Mauer; vice-president, William Goedde; treasurer, Fred. Giessing; secretary, George G. Barbour.

James D. Fleming, who until recently acted as manager in charge of the Chicago branch of the Lalance & Grosjean Mfg. Company, New York, was elected treasurer of the company at the annual meeting, February 13, and will hereafter be in charge of that department at headquarters, 19 Cliff street, New York.

The fourth annual meeting of the Missouri Retail Stove and Hardware Dealers' Association held a two days' session in St. Louis, at the rooms of the Mercantile Club, on Tuesday and Wednesday, the 18th and 19th inst.

The Rochester Stamping Company of Rochester, N. Y., had a fine display Rust Proof Ware, including Nickeled Copper Tea Kettles, Tea and Coffee Pots, Chafing Dishes, &c., at the annual convention of the Illinois Retail Hardware Dealers' Association, at Decatur, last week.

The fifth annual meeting of the North Dakota Retail Hardware Association was held in Fargo, N. D., on Wednesday and Thursday, February 19 and 20.

The third annual convention of the Indiana Retail Hardware Dealers' Association was held at the Denison Hotel, Indianapolis, Ind., on Wednesday and Thursday, February 19 and 20. The convention was a large and successful one. Many new members have joined the association, bringing the membership up to about 300. President W. P. Lewis gave an interesting address and was followed by T. James Fernley, secretary and treasurer of the National Hardware Association. Among the features of the convention were papers on "Hardware Store Arrangement," by J. D. Warren of Chicago, and on "Up to Date Hardware Advertising," by H. P. Townley of Terre Haute.

Efforts for the Abolition of Strikes.

The Executive Committee of the National Civic Federation met in New York City this week and adopted a working basis of operations for the prevention of labor strikes. The main work of the committee was the formation of the Industrial Department of the Federation, which department will deal with labor disputes and endeavor to promote industrial peace and establish harmonious relations between employers and workers throughout the country. The principles expressed in the by-laws of the Industrial Department favor the adoption of mutual agreements and expressly disavow the intention of considering abstract industrial problems. The by-laws contain the following clauses:

Conciliation Committee.—The chairman shall appoint a committee on conciliation, to consist of nine members, three of whom shall be selected from each group, whose duty it shall be, upon notice from the chairman of threatened strike or lockout of more than local magnitude, to use its good offices in restoring harmonious relations, reporting its action to the Executive Committee.

Arbitration.—Should the efforts of the Conciliation Committee prove ineffective, and should both parties to the dispute desire the services of the Executive Committee of this department, they may be invited to select two employers and two wage-earners from said Executive Committee, to serve as an arbitration board. Should the four find it necessary to appoint an umpire to finally decide the dispute they may select a fifth member from the group representing the public.

Emergencies.—Should a controversy seem of such magnitude as to justify such action, the officers shall be authorized to call a meeting of the entire Executive Committee to consider the situation and such action as may, in their judgment, be required.

Auxiliary Committees.—The Executive Committee may appoint auxiliary committees to deal with local disturbances, the rules governing the same to be in harmony with the general purpose of the Industrial Department.

BRITISH HEATING ENGINEERS.

The annual meeting of the British Institution of Heating and Ventilating Engineers was held on Tuesday, January 28, at the Holborn Restaurant, London, with a good attendance. We notice among those who were present several members of the American Society of Heating and Ventilating Engineers, among them being D. M. Nesbitt, W. R. Maguire, J. Nelson Russell, Robert E. Atkinson and Charles F. Hauss, who are also members of the British Institution.

After the election of a number of new members, the election of officers for the ensuing year was then taken up, and the following officers elected:

President, J. Nelson Russell.

Vice-Presidents, F. Dye and E. Taylor.

Secretary, E. Taylor.

Council, the officers, with L. F. Pearson, E. W. Mayner, C. Mason, S. Naylor, J. N. Greenall, W. Yates, G. Crispin and A. B. Simpson.

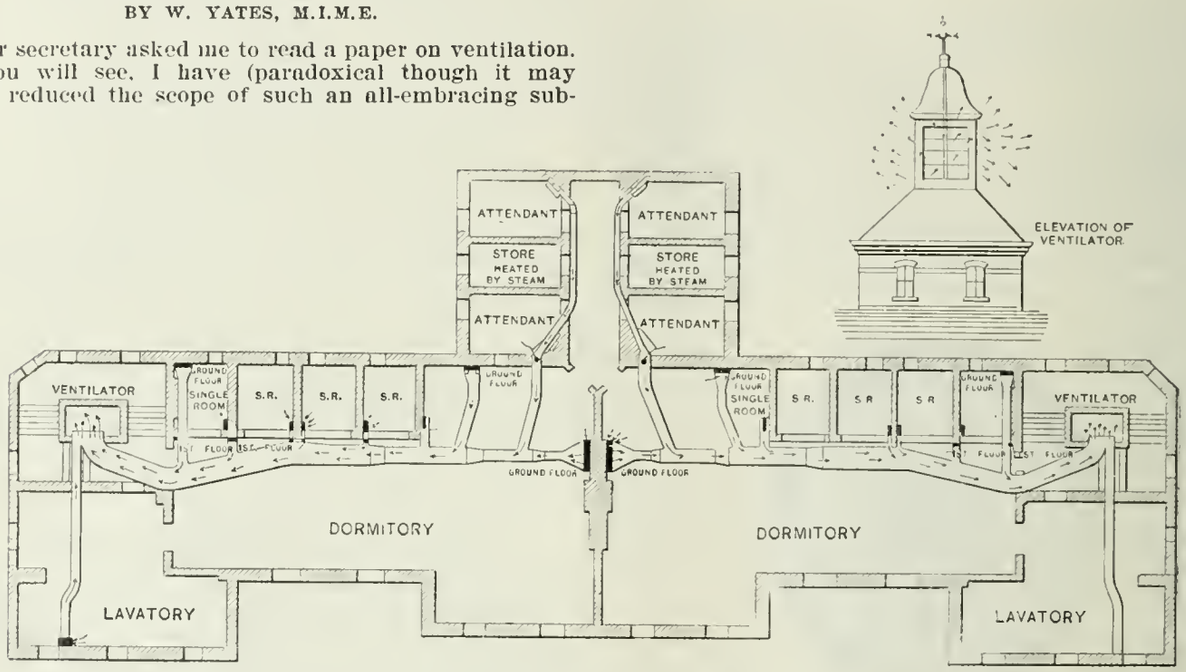
A paper on "Mechanical Ventilation" was then read and discussed.

MECHANICAL VENTILATION.*

BY W. YATES, M.I.M.E.

Our secretary asked me to read a paper on ventilation. As you will see, I have (paradoxical though it may seem) reduced the scope of such an all-embracing subject by adding to the title the qualifying adjective "mechanical." One reason for this is that I am no believer in so-called "automatic" ventilation. Another is that the principal study of my business life has been the application of fans for ventilating purposes; and I take it that the results of our own practical experience are most likely to be useful to the members of the institution. And last, though not least, it is not possible within the limits of a paper like this to treat adequately even ventilation of the mechanical order, to say nothing of the wider field embraced by the general term "ventilation."

I suppose it is not needful, in reading such a paper before the Institution of Heating and Ventilating Engineers, that I should preface it by saying anything as to the advantages to be derived from ventilation. Still, I think the point should not be passed over; and I would go further, and insist on the absolute necessity of not only our factories and workshops being thoroughly ventilated, but that all buildings—public and private—used for human occupation should have some means of clearing out the vitiated air and being supplied with the purest and freshest air obtainable, if health is to be maintained at the highest standard and life prolonged.



I need only point to the new treatment for consumption to show the great value of fresh air as a cure for tuberculous diseases. And if it will cure surely it is good as a preventive. I think it is incumbent upon us, as ventilating engineers, to press this point upon the unthinking or indifferent public, and thus bring about a change in our conditions of living that is so much needed. I think perhaps the subject may be divided under two general heads—viz., vacuum or ventilation by extraction, and plenum or ventilation by blowing in. Let me say at once—and this a point I wish specially to emphasize—that whatever method is adopted, warming should be taken in conjunction with ventilation, or troubles will almost invariably follow.

THE VACUUM OR EXTRACTION SYSTEM.

This in itself may be subdivided roughly into two methods. 1. The ventilation of single rooms, large or small, where a free outlet can be obtained in a suitable position; 2, the ventilation of a number of rooms collectively, or of single rooms, where a suitable free outlet is not obtainable. I take the simplest first. Let us consider a single room where a suitable and free outlet can be had. A free outlet is, of course, an unimpaired discharge for the fan of the full diameter or area of the latter; and here air propellers or open fans are exactly suited for the purpose. But what, it may reasonably be asked, is a suitable outlet? This must be of sufficient size to give free exit for the air, and must be in a position as far removed from the inlet as possible. At this point, therefore, the question of inlet, or fresh air supply, must be considered. And may I here be allowed to emphasize another truth which, while it ought to be self evident, is frequently ignored—viz., that it is useless to attempt to extract air from a room without adequate means for replacing what is taken out?

In other words, if there is no supply there will be no extraction. The fan will simply churn the air within itself; and just in proportion to the supply will be the extraction, up to the full capacity of the fan. I came across a homely illustration of this fact only the other day. A friend who was sick and feared the drafts placed a draft preventer round his sitting room door and found, to his surprise, that the fire would not burn nor the smoke go up the chimney. There you have the principle in a nutshell. I have frequently come across fans which were said to be useless—and certainly they were, as installed—but in many cases they only wanted a supply of air to the room to enable them to accomplish all that was desired. There must be an adequate supply; then it must enter at the right place. This, as stated, must, if possible, be on the side of the room opposite to the fan, and as far from the latter as it can be got, in order that the fresh air may literally sweep the whole room before arriving at its exit—the fan. Having settled the inlet and outlet, the next consideration is what size fan to use. This is, of course, determined by the volume of air to be removed in a given time, or, as frequently stated, the number of times per hour the air of the room is to be changed. This is another pitfall for the ventilating engineer; for some rooms are sufficiently ventilated by a change once per hour, while others necessitate several changes per minute. The latter cases are not frequent, and may be left out of consideration at present.

Following is a table giving the approximate number of changes per hour for rooms ordinarily to be dealt with. It must, however, be understood that this table is only a rough guide or basis, and that each case has to be treated according to the special circumstances and environments:

Mechanical Ventilation.—Fig. 1.—Plan Showing Pipes in Roof and Elevation of Ventilator.

* Paper read at the annual meeting of the British Institution of Heating and Ventilating Engineers, London, England, January 28.

Table Showing the Number of Changes per Hour Usually Required for Satisfactorily Ventilating the Rooms Mentioned.

	Number of changes per hour.
Offices, warehouses, &c., according to number of occupants	2 to 4
Churches	3 to 5
Schools	6 to 10
Theatres	4 to 6
Hospitals, asylums, &c	4 to 6
Smoking rooms	6 to 10
Work rooms, &c	4 to 8
Factories, dusty processes	8 to 12
Hot engine houses, &c	12 to 60

From the foregoing table it will be gathered that the number of occupants in a room affects its requirements, and, in fact, in many instances, the air contents are neglected, and the number of occupants taken as the basis for calculation. This is very generally so in schools, asylums, hospitals, &c. Authorities differ considerably as to the quantity of fresh air required per person, some putting it as low as 2½ cubic feet per minute, while others allow as much as 50 cubic feet per minute.

In a paper on ventilation, recently read before the Incorporated Society of Medical Officers of Health, A. Wynter Blyth says: "The minimum of our requirements has long been known. Men like the late Ed. Parkes, De Chaumont and Douglas Galton have all agreed on standards of purity—as measured indirectly by the carbon dioxide—viz., that the air of living rooms should contain under 6 parts per 10,000 of carbon dioxide of animal origin, which means that each person must be supplied with 3000 cubic feet of good air per hour." This is 50 cubic feet per minute, but I am afraid it will be a long time before such a quantity is accepted as a standard.

In the State of Massachusetts the law regarding school ventilation is that each scholar shall be supplied with 30 cubic feet per minute, and a bill is being considered by the New York State Legislature requiring every public building and school house to have its air changed so as to provide each occupant with 15 cubic feet per minute. When will this country wake up to the necessity for such an enactment? I, personally, should be well satisfied with this 15 cubic feet as a standard, but few public buildings in this country are so well provided for.

As an example, take the class room of a school built according to our education department's schedule. For 60 pupils it would contain, say, 7200 cubic feet, and would have to have extracted from, and be supplied with, 60 × 15, or 900 cubic feet per minute. This means a change of air once in eight minute. On the Massachusetts requirements the change would be once in four minutes, or, acording to Mr. Blyth, once in 2.4 minutes. This latter would require an expenditure, both in initial cost and upkeep, that few people would care to entertain.

Taking, say, the 15 cubic feet per minute as our standard, and the room containing 7200 cubic feet as the one to be treated, we need a fan to give an output of 900 cubic feet per minute under working conditions.

Fan makers invariably state in their lists the duty of the fan in free air—*i. e.*, when doing no work beyond simply moving air through themselves—but immediately a fan is put to ventilate a room it has some resistance to overcome, and its output drops, so that an allowance has to be made for this, varying from 10 per cent. to, say, 30 per cent. in fans fixed without trunks, and to, say, 50 per cent. or more where trunks are used, even though these may be of fair size.

The fan and its position having been selected, as also the position of inlet or inlets—for it is generally desirable to have more than one, the total area being several times greater than that of the fan if possible—it only remains now to say that this incoming air must be warmed, and perhaps the simplest form of doing this is to place radiators in frout of the openings.

It must not be forgotten that these frequent changes of air will necessitate an increase of radiating surface over that required where no ventilation is adopted. Roughly this may be put at about 25 per cent. for each change. The committee rooms of the Houses of Parliament are a good example of the method described above. The average size of these rooms is 32 x 28 x 21 feet, containing, therefore, 18,816 cubic feet. They stand side by side, with windows on one long side, and doors opening onto a corridor on the other. The design of the windows will not permit the use of larger fans than 18 inches diameter, so two are being installed in each room (to change the air about once in seven minutes). They are arranged with sashes on the outside, hinged at the top to permit a free outlet, which at the same time form a sufficient weather protection, and close quite tight when the fans are not required. The sash is operated by a cord from below. The inlets are arranged on one side, and are connected to a duct below, from which a supply of fresh air, warmed in winter, is obtained.

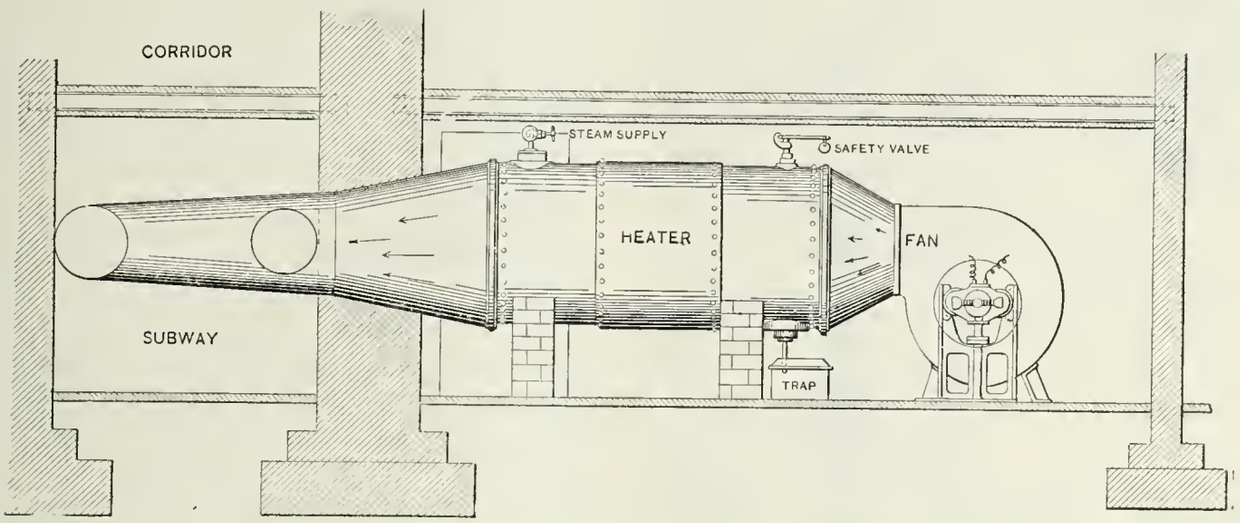


Fig. 2.—Elevation Showing Fan and Heating Chamber.

ROOMS TO BE VENTILATED COLLECTIVELY.

It frequently happens that the conditions assumed in the previous examples are not present or attainable. There may be a convenient situation for the fan, but no place for inlets, other than on the same side, which is useless, unless the air can be conveyed in trunks to the opposite side. Or there may be a good place for inlets, but none satisfactory as an outlet. Again, it may be objectionable, from an architectural or decorative point of view, to have fans showing in an open room at all. And further, in large buildings containing a good number of rooms, the multiplication of fans would mean not only a big initial expense, but a considerable item for attention and maintenance afterward.

In such cases it is generally found desirable to connect several rooms, by means of trunks, to one common center, and place the fan there. This is not always easy in the case of existing buildings, due to the difficulty of placing the trunks where they will not be unsightly, but it has frequently been done. In new buildings, however, trunks can be run between the floors, in the walls, &c.

Air propellers or open fans may be used in these cases, but the objections to their adoption are the loss of efficiency and large trunks required.

It is usually much better to install centrifugal or blower type fans of the single inlet pattern. Trunks may then be reduced to about one-fourth the area required for use with air propellers for the same output. A little more power is required when doing the work with blowers, but the other advantages more than compensate for this. The location of these blowers may be in the roof space, down in the basement, or any other convenient spot. In the case of a large hotel in Leeds just being fitted, the blowers are to go on the roof flats, being, of course, suitably protected there against the weather.

It is better to place the fans above than below, for in

the event of anything happening to them the ventilation, reduced in quantity, goes on automatically.

The size of trunks is an important point, and requires some care in calculation. Our method is as follows: Determine the volume of air to be removed from each room, and figure it on the plan. Total up the amount to be dealt with by one blower, and select one capable of doing that amount, under working conditions, not forgetting the loss to be allowed for. With this type of fan and properly proportioned trunks the loss is about 25 per cent. Ascertain the area of inlet to the blower, and divide this area into the rooms to be ventilated, in the proportion of the air to be removed from each. This will give the area of the branch pipe from each, and the mains must increase in size as the branches feed into them. But this is not the final calculation. Air in traveling through trunks has to overcome friction, and this is very marked in small sizes. It must be provided for by increasing the size. To be exact an algebraic formula would be needed, but for general purposes it is sufficient to add about 10 per cent. on the area for sizes 18 to 9 inches in diameter, and 20 per cent. down to 3 inches in diameter. It is not wise to get below that size.

Many rooms of which it has been said it was impossible to ventilate have been most satisfactorily treated by the use of these blowers, and in our own practice they are taking the place of air propellers for many purposes.

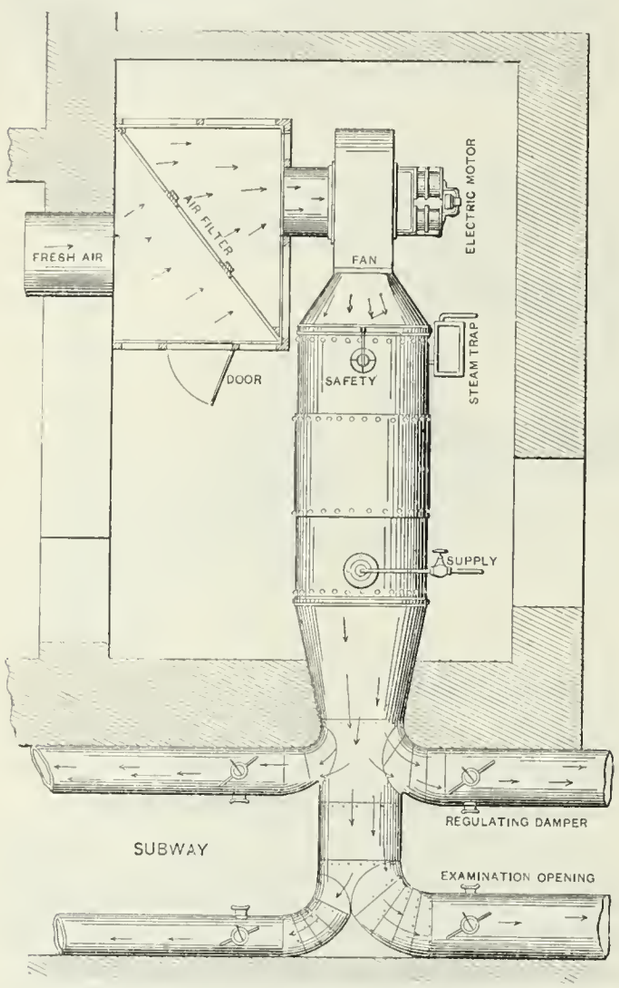

Fig. 3.—Plan Showing Fan and Heating Chamber.

At the new Patent Office Library in Southampton Buildings, Chancery Lane, four No. 5 electric blowers are fixed in the roof space. This is a large building, four or five stories high, but open in the center from ground floor to roof. The floors consist of galleries, running round the building, upon which are the book racks. Radiators stand against the walls, round each gallery, and behind them are air grids. The vitiated air extracted by the fans is replaced by fresh air through these grids, this air being warmed in winter in its passage through the radiators.

Another installation illustrating the application to a single room (in this case an engine and dynamo room) is at the Holborn Restaurant. This room is in the center of the building, in the basement, quite surrounded by other rooms. Here a No. 8 blower, with steam engine combined, is installed. It would have been quite impracticable to have attained to the desired result with an air propeller.

In this, as in ventilation by extraction, both air propellers and centrifugal fans are used, but as my experience has been mainly with the latter, I propose to deal with this plan only.

The arrangement of the blower and trunks is much the same as that last described, but is reversed. The blower must be placed in as central a situation as possible, and in the basement, if there is one. Main trunks are carried horizontally from its delivery in as straight a course as possible to the extremities of the building. From these branch trunks convey the air to vertical ducts in the walls, or tobin tubes on the wall faces, which ducts or tobins carry the air to the several rooms to be ventilated. The method of calculating the proportions of trunks is the same as for extraction. In determining the size of the blower, however, another factor has usually to be taken into consideration. If the scheme were one for ventilation only, the allowance for loss in friction, as mentioned for extraction, would suffice, but a plenum system without heating arrangements would be a failure, and in passing the air through a heater the fan duty falls considerably. It is wise in this case to allow for a loss of 50 per cent. from the free air figures of a makers' list—that is, if 10,000 cubic feet are required by the occupants of a building under consideration a fan listed to give an output of 20,000 cubic feet should be selected.

The warming of a building so ventilated is usually accomplished by placing a heater near the fan, arranged so that the latter either draws its air through the heater or forces it through prior to its entrance into the main trunk or duct. Various kinds of heaters are used. That most in favor in the United States appears to be one constructed of 1-inch wrought iron pipe. Another is the cast iron indirect radiator in its several forms. Cast iron gilled pipes have also been used, and in our practice we have installed a number of wrought iron tubular heaters, with tubes 3 inches in diameter, through which the air passes. Steam is the almost universally adopted heating medium, though many hot water installations have been made.

One important feature of a plenum scheme is the ease with which the air can be purified before being passed through the trunks and into the rooms. A screen is generally inserted at a convenient point between the fresh air inlet and the fan. It may be of coke, held in a wire work frame, or matting, or horse hair, or muslin, &c. It should be so arranged that water may flow over it, and should also be accessible or detachable for cleaning purposes. It must also be of ample size, so that the full volume of air may slowly but surely pass through it, or even 50 per cent. loss will not be enough to allow.

There has yet to be mentioned some detail of the arrangements for the air entering the rooms. The usual plan is to fix louvered air grids at a hight of about 7 feet from the floor, and thus avoid all possibility of the air current being felt by the occupants. This must also be provided against by keeping the velocity of the entering air low. Five feet per second is the usually accepted standard, but I have known cases where 10 feet per second was adopted with complete success. The movement of air at a quicker rate than 5 feet per second is perceptible, but it must be remembered that air entering a room though a grating immediately spreads, and thus loses its velocity.

For the same reason that inlets must be provided in a vacuum scheme of ventilation, outlets must be provided in a plenum system. Where these should be placed, however, authorities are at variance. One says put them near the floor, immediately under the inlet, and make the air travel horizontally across the room, down the wall and back along the floor, almost to the starting point. This sounds well in theory, but air is not so tractable as that at low velocities.

Another says, place the outlet near the floor, on the opposite side of the room to the inlet, because carbon dioxide is heavy and falls, forgetful of the fact that when exhaled by the lungs it is warm, and consequently lighter than the atmosphere, and therefore tends to rise.

Still others advocate the outlets being placed at the ceiling level, opposite the inlets. My own preference is for a combination of the two latter plans—viz., outlets near the floor and ceiling as well, on the opposite side to the inlets, so arranged that either can be used at pleasure, or both in conjunction if desired. The size should be slightly less than the inlets, so as to produce a pressure in the room slightly above that of the atmosphere, and thus prevent inward drafts from doors, &c.

Perhaps a description of an installation on the above lines, which we made at the Antrim County Asylum (Figs. 1, 2 and 3), will enable me to make clearer the general principles already stated.

The architects stipulated for a change of air four times per hour in the hospital blocks and three times per hour in the chronic blocks and dining and recreation halls, the temperature throughout to be 60 degrees F. when 30 degrees outside.

The buildings consist of the executive block (including dining and recreation halls), centrally located. Two

hospital blocks, two chronic blocks (one each for male and female in both cases), with workshops, laundry, boiler house, engine and dynamo rooms, &c.

A main corridor connects all the buildings, and under this is a subway, averaging 6 feet high and 6 feet wide. Branch subways go under each block, and these main and branch subways are utilized for steam, water and air pipes, as well as electric cables, &c. Seven electric blowers are installed, there being one for the central executive block, one for each of the two chronic blocks and two each for the two hospitals. They are all alike in size, having 24 inches diameter inlets, and equivalent area outlets. They run at 380 revolutions per minute, and deliver into the rooms from 6000 to 6500 cubic feet per minute. Their free air output is 11,400 cubic feet per minute. Each motor takes 1400 watts per hour.

In order to obtain the purest air possible, a turret is built in the center of the space between each of the buildings, and from the base of these turrets tile pipes, of 30 inches diameter, convey the air to the fans. Before entering the fans, however, the air passes through screens, made of woven horse hair, over which flows a gentle stream of water, and these abstract the particles of dust, carbon, &c., with which the air may have been charged up to this point. In addition, a little humidity is imparted, which is very beneficial in dry weather. The air is then passed through steam heaters, each of which consists of a wrought iron cylindrical shell, being 8 feet long, 3 feet 6 inches in diameter, and containing 93 3-inch tubes. The tubes are expanded into end plates as in a locomotive boiler, the air passing through them, and steam outside and within the shell. The steam pressure carried is 30 pounds per square inch. Each heater is trapped, and the condensation turned into return pipes, which empty into a tank near the boiler house. From there it is pumped back into the boilers. From each heater, galvanized sheet iron tubes, placed at the ceiling of the subways, carry the air to all parts of the building. It was originally intended that the air should be carried from these tubes, up the walls, in tile pipes, and in some cases that has been done, but in others the buildings had progressed too far before the ventilating scheme was settled, and so the alternative of rectangular tubes on the face of the walls was adopted. These tubes or tile flues, as the case may be, terminate in the rooms in louvered gratings, actuated by loose square keys which are carried by the attendants. Small rooms have one outlet only, but the larger ones have several.

It is interesting to note the air velocities in this scheme. At the fans, and throughout the main trunks in the subways, it is 27 feet per second. As each branch leaves the main a damper is fitted, which reduces the velocity to about 20 feet per second. The vertical ducts are enlarged again to reduce the velocity to about 10 feet per second; and the louvered gratings are large enough, and so constructed, that the air issues into the room at 5 feet per second. A considerable saving in trunks is thus effected.

Another useful purpose served by the dampers mentioned in the last paragraph is that they enable the whole air supply to be fully regulated and properly distributed. If one branch is getting too much, it can be checked in favor of another which may not be getting quite enough.

The temperature of the air entering the rooms in winter averages about 110 degrees F., but tested in any part of the room other than within a few feet of the inlets it registers 60 degrees when 30 degrees outside.

At the foot of each vertical duct, at every bend, and at numerous points in the straight lengths examination openings are fitted, permitting cleaning to be done if required; but so far this has not been needed, due doubtless in some part to the high velocity of the air.

Vitiated air outlets are arranged in all the rooms, to extract the air at the floor or ceiling level as desired or partially at both, a lever actuated by a loose key, working both outlets at once, opening one when closing the other. Tile flues or sheet iron tubes, as in the case of the inlets, convey the air up the walls to main extraction trunks in the roof spaces, and these terminate in ornamental turrets on the roofs.

As to cost, the contract was a little over £4000, which for 400 patients, plus attendants, makes the amount about £10 per head, for the complete system of heating and ventilation, exclusive of boilers, which were in another contract.

The upkeep and cost of working the system is difficult to ascertain, seeing that the same boilers supply kitchen, laundry, hot water service, &c., but a timed test was made of the condensation of the heaters, and this gave 2500 pounds of steam per hour. Calculating on this basis, and that there would be 2691 hours per year requiring heat, we estimate the coal consumption to be 500 tons per year, which at 10 shillings per ton equals £250. Seven blowers, taking 1400 watts each per 3588 hours per year (in suitable weather the fans are stopped and all windows opened), would mean 35,162 units, which at, say, 1 penny per unit, would amount to £146 10s. 2d. for the year. Putting the two together and adding for attendance, incidentals, &c., £104, makes an amount of £500, which is 25 shillings per patient per annum.

ASSOCIATION NEWS.

Ohio Master Plumbers.

The annual meeting of the Ohio State Association of Master Plumbers was opened at 10 o'clock on Tuesday morning, February 11, in the Army and Navy Hall, at Cleveland, Ohio, by President Rolla B. Moodie of Dayton, with a large attendance. The principal theme of discussion was trade protection. An effort is being made to strengthen the association along these lines, and it is reported that the manufacturers and dealers in plumbing supplies are to be asked to refuse to sell material to plumbers who are not members of the association. At the close of the convention Dayton was selected as the place for holding the next meeting, and the following officers were elected for the ensuing year:

President, Eb. Ellen, Cleveland.
Vice-President, A. S. W. Hoffman, Columbus.
Secretary and Treasurer, John Leese, Cleveland.

The name of John L. Riley of Dayton was unanimously selected to be recommended to the National Association for appointment as National State Vice-President for Ohio. On Tuesday night a banquet was tendered to the delegates at the Forest House, at which 275 covers were laid, after which the delegates attended the Empire Theatre in a body. After the theatre a lunch was served in the association rooms in the Chamber of Commerce Building.

Buffalo Master Plumbers.

At the annual meeting of the Master Plumbers' Association of Buffalo, N. Y., held last week, the following officers were elected for the ensuing year:

President, Frank L. Beyer.
Vice-President, Daniel Lund.
Treasurer, Albert J. Batt.
Secretary, John J. Kavany.
Board of Trustees: Charles Geiger, Joseph S. Stygall, Samuel B. Stewart, William H. Martin, John J. Kavany.
Sergeant-at-Arms, Edward P. Franke.

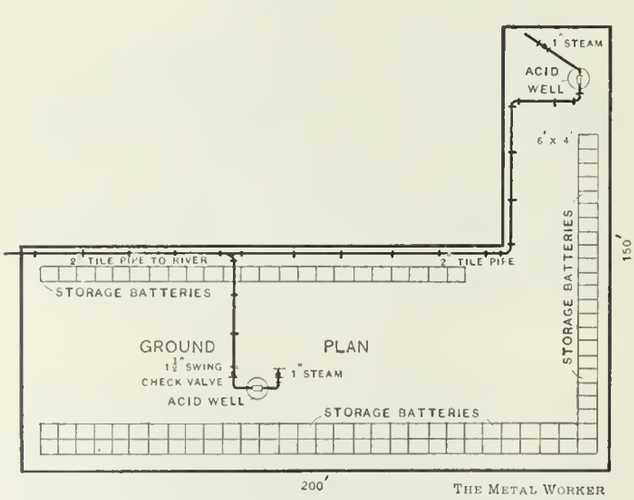
Massachusetts Master Plumbers.

The regular quarterly meeting of the Massachusetts State Association of Master Plumbers was held at Boston last week with the different parts of the State well represented. The official reports showed an increase in membership during the year, the result of the work of Organizing Clerk C. C. Brown. The Cleveland resolution was discussed favorably. After the meeting a dinner was given to the delegates.

Iowa Master Plumbers.

The fifteenth annual convention of the Iowa State Association of Master Plumbers was held at Davenport, Iowa, on February 12. The principal feature of the meeting was the consideration given to the Cleveland Resolutions, which were indorsed. The following officers were elected for the ensuing year:

President, A. H. Walker, Des Moines.
Vice-President, J. L. McCarthy, Clinton.
Secretary, H. W. Noble, Sioux City.
Delegates to National Convention: Robert Clayton, Davenport; John McDermott, Dubuque.



The smaller factory of the Red Wing Sewer Pipe Company, Red Wing, Minn., which was totally destroyed by fire recently, will be rebuilt at once. The loss was fully covered by insurance, which has been adjusted, and a large force of men are now cleaning up the plant. The company advise us that they cannot tell as yet whether the power plant has been destroyed, but the probabilities are that it will be reinstalled, after being rebuilt.

AN ACID WELL EJECTOR.

BY D. F. N.

In one of the large electrical power plants on the river front in New York vaults were built under the sidewalks on one street 200 feet long and about 150 feet long on the avenue, as shown by the plan given in Fig. 1. In these vaults are 350 small tanks for storing electricity, their dimensions being 6 x 4 x 2 feet each. The tanks are lined with 8-pound sheet lead, the seams in the lining being made tight by lead burning, so as to withstand the corrosive effect of the strong acid solution. Under these tanks there is an accumulation of waste water and surplus acid, which finds its way to the center of the concrete floors on the street side and on the avenue side, where there are circular wells 4 feet in depth and 3 feet in diameter. The floors have a pitch to the center, where the wells are located. The floor of the vault being below the level of high tide in the river, the salt water oozes through the walls. The disposition of this water and of the acidulated water from the tanks has been a cause of considerable annoyance. The task of overcoming the difficulty was placed upon the steam fitter in the employ of the company, who was ordered to make an ejector to empty the water out of the wells each time they became filled. The porter in the basement, in connection with his other duties, was in charge of the wells. Ejectors were built from 1½-inch iron pipe with proper steam jet and strainer, and obtaining power from 1-inch steam connections. They seemed to do the work fairly well for about a week or so, after which they were found to act improperly. They were replaced with iron pipe, with a recurrence of the same result in a short time.

The plumber was then called upon to try and remedy the evil. He disconnected the iron pipe in the well, and found it eaten away in several places at the threads which lay in the bottom of the well. After removing the iron pipe ejector he set to work to overcome the trouble by introducing ejectors made of lead as substitutes for those made of iron. In construction, the lead ejectors had to be made so as to be thoroughly accessible for cleaning purposes. In making the ejector an extra heavy cast lead tee 10 inches long and 5 inches in diameter had to be molded, with a jet within the center of the casting tapered to the edge of the suction chamber inlet, the end of the jet having a ¼-inch bore on the inner

An Acid Well Ejector.—Fig. 1.—Plan, Showing Location of Ejectors.

side and 1-inch on the outer side, as shown in Fig. 2. One end of the tee for the discharge pipe had to have a standard thread 1½ inches deep into the inner opening. This thread was cut on a lathe. A piece of 1½-inch 3/A lead pipe, 5 feet long, was next taken in hand and beaten down to the size of 1¼-inch 3/A lead pipe for a space of about 4 inches from the end. This pipe was also placed on the lathe and threaded 2 inches long to fit snugly into the thread in the tee. The same work was performed on the end of another piece of pipe to receive the steam, excepting that the pipe was 1-inch beaten down for a ¾-inch thread. The branch end of the tee for the suction pipe and strainer was increased in size to receive 2-inch 3/A lead pipe and beaten down to 1½-inch pipe size for a space of 4 inches from one end. The other end was beaten up to close the pipe tight, forming a half globe at the extreme end. This piece of pipe was 11 inches long, and had five rows of ⅜-inch holes drilled out clean on the length to make a strainer. In making up the joints it was found necessary to cover the threads with plumbago, as the lead to lead connection had a tendency to stick on the pipe entering into the tee. The upper ends of the 1-inch and 1½-inch lead pipes

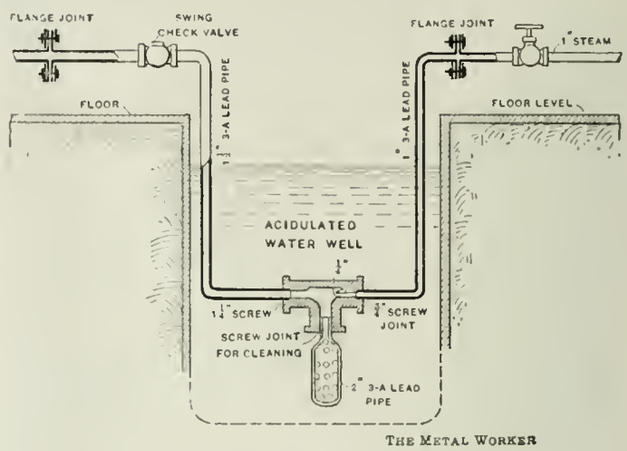


Fig. 2.—Elevation of Ejector and Connections.

had heavy brass collars slipped over them. Then the lead was beaten out to form a flange, and a union was made by means of bolts through the two brass collars. One of the brass collars on the steam end was threaded on the inside to receive the iron pipe. These ejectors have been in operation for some time, and are doing the work required successfully.

The Public Comfort Question.

The following pertinent article by Joseph A. Lord of New York, which will apply to most of the large American cities, is reprinted from the New York *Times:*

Scene: New York City. Time: 1902. Mr. Primrose suddenly finds himself forced by nature to seek a retiring place, enters one of the shops in the vicinity, and is very courteously directed to the *café* on the corner.

After some hesitation, he decides to act upon the information, although he is at home an advocate of prohibition. He is both surprised and pleased to find a well appointed, properly ventilated toilet room, with wash basins, hot and cold water, towels, soap, &c. As the *café* proprietor is not in business for his health, he expects that those who patronize the sanitary department will do likewise at the *café* end. Mr. Primrose, however, being a man of mind and opinions, goes away without doing the latter.

Michael Monnihan is at work on a building in the course of erection. Having a call of the same nature he finds himself between two fires, as it were. A nuisance committed in the building will result in his discharge, if detected. If he leaves the building during working hours he will be discharged. In the ordinary flat buildings contractors rarely make provision for the men. In the large skyscrapers a trough affair, a very crude arrangement, is placed in the cellar, and soon becomes so foul that the average man either waits until noon or evening in preference to using it.

Another point: Imagine a man ten, fifteen, or even five stories up, starting for the cellar. The result is he goes to a saloon where he knows he will be clean and comfortable. Not being as strong minded, and possibly more fair minded, he shows his appreciation by patronizing the *café*.

Mrs. Primrose or Mrs. Monnihan, placed in the same position, is to be pitied, for unless they happen to be in the vicinity of one of the department stores, a foundation is laid for possible sickness.

Less talk about prohibition, Sunday closing, &c., and some practical attempt to remedy these conditions would render the task of the Sir Joseph Bowleys and other friends and fathers of the poor, yes, and the semi-poor, much easier, and I might add that it could be done on the same philanthropic per cent. basis that model tenements, coffee inns and other estimable projects are conducted. The few places now provided by the city are anything but inviting, and are not made use of by the average man for reasons that can easily be imagined.

I would be pleased to communicate with those who

are interested in this matter looking toward the formation of a committee to take up the question of bringing about a change, as space does not permit the publishing of many things I might discuss in connection with this subject. The many years' study of these conditions causes the belief that the majority of men receive their first introduction to the saloon through the reason above stated.

Some will say this is a delicate question for public discussion. Well, we must admit that a surgeon called to the scene of disaster does not ask those hurt many questions, but starts at once to put in shape broken bones, even though the victim does resent the seemingly rough treatment.

CONSOLIDATION IN THE RANGE BOILER INDUSTRY?

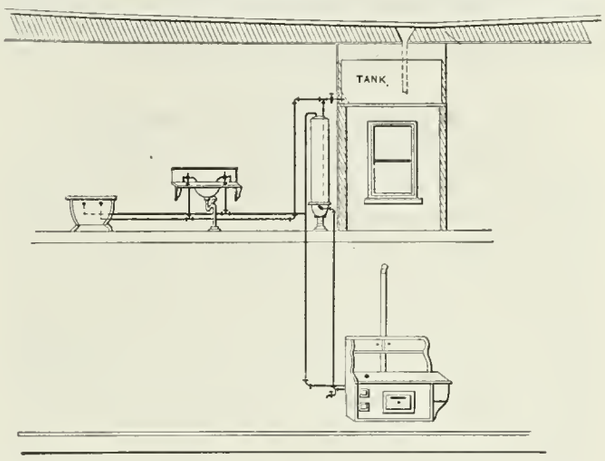
The Range Boiler Association have been holding meetings in New York City since Tuesday of this week, but up to the present no news of a definite character as to the result of their deliberations has reached the trade. The meeting on Tuesday was of a routine nature. Several of the members of the association have been accused of violating the rules, and the hearing of the arguments in these cases occupied the attention of the association during the whole of Wednesday. The discussion of these complaints was continued on Thursday. There is a feeling among the members of the association that more stringent methods of conducting the affairs of the association will have to be devised, in order to keep some of the weak kneed members in line.

There is a proposition before the association, whereby the various plants of the members are to be absorbed by one company, which will take over the manufacture and control the sales of the entire product in this country. What success the promoters of this scheme will meet with is very problematical. It is understood that this proposition has been made several times previously, but upon examination it was found that the promoters did not have the proper backing. The people who are behind the scheme this time, however, are said to be in a position to make a definite arrangement; consequently the scheme may meet with the favorable consideration of the members. It is claimed that this will be the only way of eliminating the trouble from the range boiler industry.

The New Eagle Pipe Wrench.

Since the introduction of the Stillson pipe wrench a number of years ago no radical improvement or change has been made in this style of tool. The design of the Stillson wrench was so perfect that it has been universally adopted throughout the world, and nearly every

The New Eagle Pipe Wrench.



other wrench subsequently introduced has been more or less of a copy of the principal features of the Stillson construction. The new Eagle pipe wrench that is just being manufactured and placed on the market by the Frank Mossberg Company, Attleboro, Mass., an illustration of which is given herewith, is probably the first radical departure from the construction of the standard pipe wrench above referred to. The wrench derives its name from the peculiar shape of its jaws. It is simple in construction, and is said to work with absolute success. The tool adjusts itself instantly to any size of pipe or rod, from the largest to the smallest, and the harder the operator pulls on the handle the more firmly the jaws will grip the pipe, while a backward motion will instantly release the hold. In this respect it can be operated very much the same as a ratchet wrench. In designing this wrench the manufacturers had in view the production of a pipe wrench that should be quick and convenient to operate and which would have a firm grip without slipping, which objects they claim to have accomplished in a most satisfactory manner. The wrench is especially adapted for the use of gas and steam fitters, plumbers and machinists, as well as of all who have occasion to use such a tool. It is made from the best drop forgings of finely finished and well tempered steel.

COLD WATER FROM A HOT WATER FAUCET;

HOW IT WAS REMEDIED.

BY OLIVER TWIST.

The range boiler was full of hot water, but nothing but cold water could be got out of it at any of the fixtures. It is true that there was no fire in the range at the time; but, if the pressure be on the system and the boiler full of hot water, then of course it should be "on tap" at any hot water faucet. Fig. 1 shows how the boiler was connected, the system being supplied from a

Cold Water from Hot Water Faucet.—Fig. 1.—The Original Pipe Connections.

tank near the ceiling of the second floor of a dwelling having a flat roof, which is graded to a point immediately over the tank, into which the rain water is collected. This tank is placed just below the joists, a manhole being provided in the roof for cleaning and repairs. It is supported by partitions at both ends which form a nice litle room for the storage of linen, &c. The range boiler is located in the bathroom, which leaves more room in the kitchen, and also helps to heat the bathroom in the winter. It is supplied through a ¾-inch pipe, which also connects to the range, and from thence to the top of the boiler, the idea being to have a quick

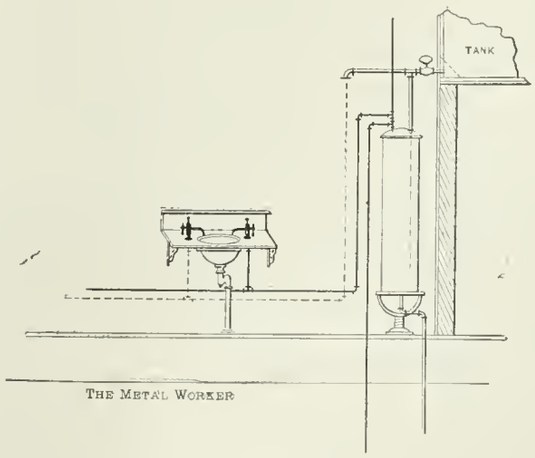


Fig. 2.—The Altered Piping.

heating system, so that hot water might be used at the fixtures a few moments after the fire is started. This, of course, could not be done if it was connected to the side of the boiler, as is usually the practice. The hot water supply to the fixtures was taken from a tee placed in the circulating pipe between the range and the boiler about 8 inches above the bathroom floor.

In Fig. 2 is shown how the trouble was overcome. The tee just mentioned was removed and a ½-inch pipe

was run directly to the top of the boiler, where it was connected to the side of a ¾ x ½ tee. A ⅜-inch pipe from the top of this tee was taken to the top of the tank for a relief pipe to the system. The dotted line in Fig. 2 is the cold water supply to the fixtures, with the exception of the water closet, which is supplied direct from the street pressure. A hose bib is placed at the lower tee near the range, which answers two purposes. The system may be emptied by it for repairs, and should the tank run dry in an unusually dry summer it may be refilled from the street pressure by means of a hose attached to the sink bib. A strainer should also be placed over the outlet of the tank, so that any danger from sediment blocking the pipes may be removed.

This method of using soft water for the range boiler has several advantages to recommend its use. It is economical, because water rates are reduced considerably, and the trouble so often met with on account of pipes being filled with lime is entirely removed, which every one will admit is a good feature. Hot water can now be obtained so long as there is any in the boiler, whether there is any fire on at the time or not.

The National Radiator Company.

The announcement is being sent to the trade by the National Radiator Company that they have succeeded to the entire business, good will and franchise of the Fowler Radiator & Mfg. Company of Johnstown, Pa., and have organized with Samuel B. Waters as president, and John H. Waters as secretary and treasurer. The announcement states that the company are now enlarging their plant and providing it with new equipment in order to fill promptly the increasing orders which the demand for their wall and regular styles of radiators is bringing to them. They also state that they are bringing out a number of new patterns of radiators, which will be presented in a new catalogue, which is now in course of preparation. The new company state that the goods produced by them will be of the same standard of excellence heretofore maintained by the old concern, and that their patrons will receive liberal treatment in all dealings.

Heating and Plumbing Notes.

Some time ago it was reported that an acetylene association, similar to that in existence in Germany, was to be organized in Great Britain, for the regulation of the acetylene trade. The movement, however, fell through at that time; but recent advices from London indicate that it has again been taken up, and that a definite formation of an acetylene association has taken place, with a full list of directors and officers, who are said to include men of importance in the industry, as well as of scientific prominence outside of the trade. The aim of the association is said to be for trade protection, and also for the advancement of acetylene engineering, and for the publication of information on this subject.

The Anderson Coupling Company, Portland, Conn., are sending to the trade a circular showing their patent Beer and Ale Tap Couplers. With these substantial and well finished brass fittings and the tools which they provide for connecting them with block tin and tin lined lead pipes any ingenious mechanic can make the connections with beer and ale barrels in a cellar and lead them to the faucets under bars on a floor above.

Thomas Scatchard died of paralysis on February 13, at his home at Little Falls, N. Y. For many years he conducted a large plumbing business in that city, but was compelled to retire on account of ill health four years ago. He was born in England about 50 years ago, and came to this country when quite young. He is survived by a wife and two children.

Under an order of Judge Halsey, the plumbing in the Court House at Milwaukee, Wis., has been subjected to a test, and has been found so bad that most of it will have to be taken out.

The Board of Examiners of Plumbers at Grand Rapids, Mich., have found it expedient to amend the rules and regulations governing the granting of licenses, so that now any person forming a new firm or joining an old one must qualify and secure a master plumbers' license.

The council of the village of Granby, near Montreal, Canada, has passed a by-law to be submitted to the ratepayers authorizing a loan of $15,000 to the Granby Supply Company for ten years without interest, and exemption from taxes for 20 years. The company, of whom Edward Bradford is the promoter, undertake to have an annual payroll of $15,000, and expect that it may be much larger than that sum.

Peter Adriance & Son are placing a steam heating plant in the residence of Samuel Thorn, at Poughkeepsie, N. Y.

The Argon Mfg. Company, Denver, Col., are sending to the trade a four-page circular devoted to the Argon Air Valve, which is said to work automatically on steam or hot water heating systems under all conditions. The Valve is of the float character, and is constructed so as to operate quickly.

John Beatty Gordon, a well-known master plumber of East End, Pittsburgh, Pa., died at his home, 525 Park avenue, on February 11, aged 40 years.

The Board of Education of South Bend, Ind., awarded the contract for heating the Oliver and Perley schools, in that city, to MacGinn, Bradley & Co. of Chicago, at their bid of $14,600.

The Penn Radiator Company, Corry, Pa., have completed arrangements to double the present capacity of their plant. Plans are ready for the new buildings, and they will be started as soon as the weather permits. This is the second time the company will have doubled their output since they were organized a year and a half ago, having finished putting up a new foundry, core room and cupola less than six months ago.

A card issued by the Estate of E. F. Keating, 452 Water street, New York, announces that Samuel G. McFarland, who has been prominently identified with the plumbing supply trade of New York City for many years, has become connected with the Keating establishment, and will hereafter represent it in the boroughs of Manhattan and the Bronx.

The Committee on Public Property, Newburyport, Mass., will receive bids until February 28 for heating and ventilating the Putnam School Building, in that city.

Libby & Blinn, Hartford, Conn., are installing a Cottage Boiler at Osborne Station, Newington, Conn.

J. L. Bixby, Jr., of the Bixby & Eddy Company, 215 Franklin street, Boston, Mass., dealers in Steam, Water and Gas Specialties, was a visitor at *The Metal Worker* office this week.

One of the largest warm air heating plants that has been installed in the West for some time was placed recently in a school building at Walla Walla, Wash., by W. G. McPherson of Portland, Ore. The building is two stories in hight, and is 30 x 50 feet in size, having eight rooms. It is heated by four 60-inch casing furnaces set in brick. The outflow of foul air is produced by means of four stack heaters, the air in each room being changed five times per hour. The system has been subjected to test, and is said to heat and ventilate the building perfectly in the coldest weather, reflecting great credit on Mr. McPherson, who designed and installed the plant.

Barlow Brothers, Waterbury, Conn., are busy with a number of plumbing contracts, and are installing an automatic sprinkler system for the Waterbury "American."

Joseph Zane, one of the pioneers in the plumbing business in Boston, Mass., died at his residence, in that city, on February 14, aged 85 years. He was born in Baltimore, Md., and there learned the plumbing trade, after which he worked in New York, making the acquaintance of P. T. Barnum. He afterward did business in Bridgeport, Conn. Later, on the advice of Mr. Barnum, he went to Boston, where he had been in business for half a century. Mr. Zane was widely known as the inventor of the Zane Water Closet and a number of other plumbing specialties. He is survived by his wife.

The Federal Boiler & Supply Company have

opened offices in the Federal Building, 88 and 90 Centre street, New York, in charge of E. E. Baker and A. E. Pfahler, where their varied lines of Boilers and Radiators and a full line of Steam Fitters' Supplies and Specialties can be supplied.

C. V. KELLOGG has moved his office in New York to the Federal Building, 88 and 90 Centre street, where he has a fine suite of rooms.

MAYOR KNIGHT of Buffalo, N. Y., has appointed Frank L. Beyer a member of the Examining and Supervising Board of Plumbing.

A HOT BLAST heating system has been installed in the City Hall of San Francisco, Cal., which is claimed to be the largest plant of the kind in the world, being designed to furnish 10,000,000 cubic feet of air per hour. A 14-foot fan is used, driven by a 45 horse-power engine.

THE Board of Public Improvements of St. Louis, Mo., has approved the sewerage system of that city submitted by Sewer Commissioner Hermann. When completed, this will increase the demand for the services of the local plumbers.

A BILL to compel gas companies to place on all gas meters automatic valves to prevent the escape of gas in case of fires has been favorably reported to the New York State Legislature.

AUGUST GEIGER, Philadelphia, Pa., will install a low pressure steam heating plant at 310-312 Vine street, in that city.

New Firms and Changes.

THE BICKFORD HEATING & ENGINEERING COMPANY have been incorporated at Tiffin, Ohio, with a capital of $25,000.

C. G. KUNNEEN, who has been traveling for Fairbanks, Morse & Co. of Chicago for several years, has resigned his position and entered into partnership with Barnett & Richards, on West Bridge street, Grand Rapids, Mich. The new firm will be known as Barnett, Richards & Kunneen.

THE THERMOGRADE VALVE COMPANY have been incorporated at Syracuse, N. Y., with a capital of $10,000 by Hiram Thompson, E. L. Chaney and Joseph L. Brindley to manufacture Steam Valves, Traps and Heat Controllers.

THE ALDENS PLUMBING & HEATING COMPANY, 48 Bloomfield avenue, Passaic, N. J., have been incorporated, with a capital of $10,000, by Levi Aldens, George S. Aldens and Charles E. Aldens, to do a plumbing and heating business.

A Threatened Famine in Foundry Iron?

There are indications of a buyers' scare in foundry pig iron, since apparently some consumers, large and small, are ordering iron in excess of their usual requirements, having grown nervous over the possibility that their raw material may not reach them in the quantities and at the times desired. During December, in particular, and in January, to some extent, production and deliveries were seriously interfered with, the former by a scarcity of coke and the latter by the prevailing troubles in transportation. Quite recently these distributing influences have again made themselves felt, and apparently have contributed to emphasizing the danger.

While these troubles eloquently prove how enormous is the consumption, and how closely, with the light stocks in furnace yards, we are sailing to the wind as to supply, they do not necessarily foreshadow an actual famine. With the coming of spring we may expect that the railroads will be able to do justice to the demands of the iron industry for prompt conveyance of raw materials and of products.

Production is not only likely to be less hampered in the future, but is expected to expand quite considerably. During the next few months a number of furnaces are to resume, after an idleness more or less prolonged. Among these are, in the South, Trussville, which has just started; Lady Ensley, which is to go in in April; the second Woodward, probably in the same month; Talladega and Allegheny af an early date, and No. 2 Sloss, remodeled and enlarged, in April or in May. Max Meadows in Virginia, has just blown in, Gem in Virginia and the second Middlesbrough in Kentucky will probably produce in April. A large new producer, the fine new furnace of the Republic Company, in the Birmingham district, will be added to the ranks in March.

In the East we have Durham, Pequest, Allentown, one Brooke and later on Cedar Point, which will all contribute their quota.

From the Central West, on the other hand, come reports that several furnaces are to swing off from foundry to basic or Bessemer iron, and it is this fact which has created some uneasiness. But it is in this great region that we may most expect an improvement in the production of the plants which have suffered most from the coke and car embargo.

The Southern producers, of course, are the largest single factor in the foundry trade, since they make nearly one-half of the entire product of the country. Their position is well illustrated by that of the eight leading interests in Alabama, Tennessee and Virginia. We understand that these concerns have in the aggregate on their books orders for 700,000 tons of foundry pig iron scattered for delivery during the year, the bulk of course for the first half. They do, however, run to the end of the year. The same furnace interests have unsold a capacity of 700,000 tons of pig iron for the balance of the year, so that, so far as the principal source of foundry iron is concerned, there is a large tonnage still available.

Unfortunately data are not available for the other producing sections, but with such a reserve it seems somewhat hasty to conclude that there will not be pig iron enough to go around.

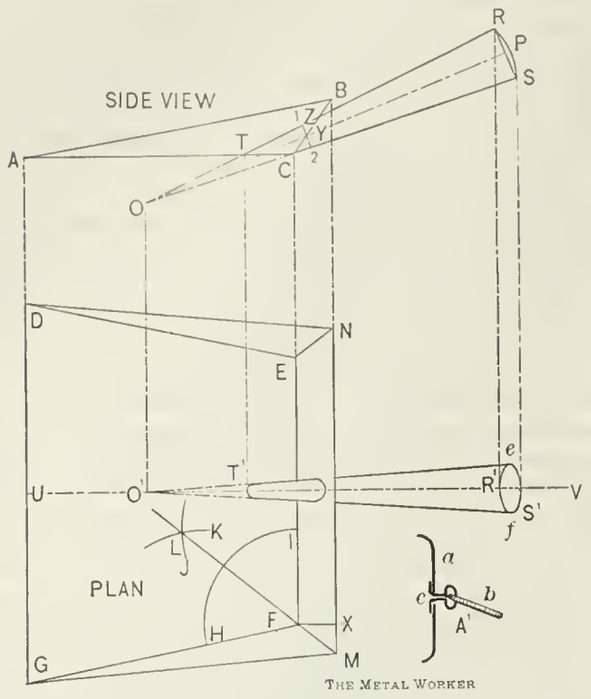
There remains one point to which attention should be called, and that is the possibility of importations of foreign pig iron, should prices be advanced unduly by a buyers' stampede. That this is not so remote is proven by the fact that to-day 5000 tons of No. 3 Middlesbrough foundry pig iron was purchased for importation.

It must not be forgotten either that the second half of the year will bring into the market a number of new blast furnaces. It is true that the greater number of them, either the three stacks at Clairton, Pa.; the two furnaces of the Lackawanna Company, removed from Scranton to Buffalo; the two Colorado furnaces, the new La Belle and others will serve the steel trade. But they will relieve the situation in that direction and will thus favorably influence matters in the foundry iron trade proper.—*The Iron Age.*

A Solar Motor.

From an engineering point of view, says A. G. Miner in *Shop Talk*, the solar motor erected at the ostrich farm at South Pasadena, Cal., is of quite an interest. This means of utilizing the heat energy which comes from the sun is the outcome of many investigations and experiments in that line and is only one of the various means that have long been experimented with to utilize the earth's natural forces. Tidal machinery is another one of these power developing ideas. Properly utilized this form of motor should serve to somewhat allay the fears of those who predict the exhaustion of the world's coal supply and the subsequent end of the world.

The reflector is in the shape of a huge open umbrella, 32 feet in diameter. The parabolic reflecting surface, 640 square feet, is always automatically turned toward the sun by means of clock work, so that the rays are focussed in rings on the central tube or boiler, which takes the place of the stick in the umbrella. The boiler is a tubular one holding about 100 gallons of water. At a test, 192 pounds of water per hour was evaporated, forming steam of 150 pounds pressure. The boiler is used to supply steam for pumping water, for irrigating purposes, and at this test the pumps delivered 1400 gallons of water per minute against a head of 12 feet.



Naturally, the efficiency of the motor is decreased in the absence of direct sunshine, but it generates steam nevertheless, and is located in a country where the sun is to be depended upon. It is rated at about 15 horsepower and cost approximately $2500.

PATTERN FOR A DUST PAN

Without Allowance for Lap.

A square cornered dust pan is a simple article that can be made in any shop out of IX tin. The method for cutting the patterns is not difficult.

In Fig. 1 let A B C represent the side of the pan, and D E F G the view of the bottom on the line A C in side view. It is now necessary to obtain the miter line of the

Pattern for a Dust Pan.—Fig. 1.—Plan and Side View.

corners in the plan. With F in the plan as a center, describe the arc H I, so as to intersect the sides of the pan G F at H and F E at I. Then with H and I as centers, and with any convenient radius, describe the arcs K and J respectively, intersecting each other at L. Then through L and F draw a line, extending it outward toward M. Intersect this by a line projected from the point B in side view. From M draw a line to G, thus completing the side of the pan in plan, as shown by G F M. In similar manner draw the opposite side D E N.

In the side view draw O P, the center line of the

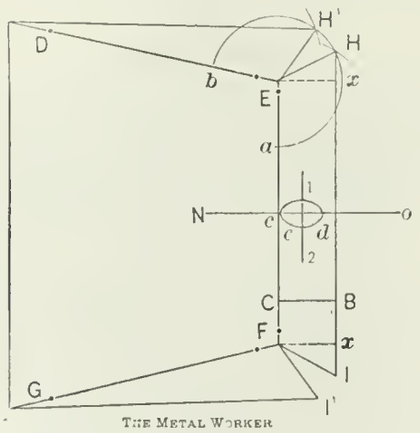


Fig. 2.—Pattern for Pan.

handle, so as to intersect the bottom of the pan and also the back at Y. At right angles to O P draw the line R S of the proper dimensions, and from R and S draw lines to the center O intersecting the back and bottom of pan at Z and T and the bottom at C respectively. To obtain a view of the handle in plan, which, however, is not necessary in the development of the pattern, proceed as follows: Through the center of the pan draw the line U V, then from the points O, T, R and S in side view drop lines intersecting the center line in plan at O¹, T¹, R¹ and S¹. Now take the distance from P to R in side view, and place it in plan, as shown on either side of the center line by *e* and *f*, and from these points draw lines to the center point O¹. The solid lines shown give the plan view of the handle.

For the pattern for the pan take a tracing of D E F G and place it as shown by D E F G in Fig. 2. Now take the distance from C to B in side view in Fig. 1 and place it as shown at right angles to E F in Fig. 2 by C B. Through B parallel to E F draw the line H I. At right angles to E F and from points E and F draw the lines E *x* and F *x*. Now take the distance from X to M in plan in Fig. 1 and place it as shown from *x* to H and *x* to I in Fig. 2, and draw lines from H to E and I to F. Now with E as center and E H as radius describe the arc *a b*. Now with *a* H as radius and *b* as center intersect the arc *a b* at H¹. Draw lines from E to H¹ to D. Trace similar miter on the opposite side, as shown by F I¹ G. Then will D H¹ E H I F I¹ G be the pattern for the pan.

Referring to the side view in Fig. 1, it will be noticed that the handle passes through the back of the pan and is soldered to the bottom at T C. For the opening to be cut into the back of the pan proceed as follows. Bisect the line E F in Fig. 2 by N *o*, then take the distance from C to Z in side view in Fig. 1 and place it as shown on the line N *o* in Fig. 2, from *c* to *d*. Bisect *c d* and obtain the point *e*, through which at right angles to *c d* draw 1

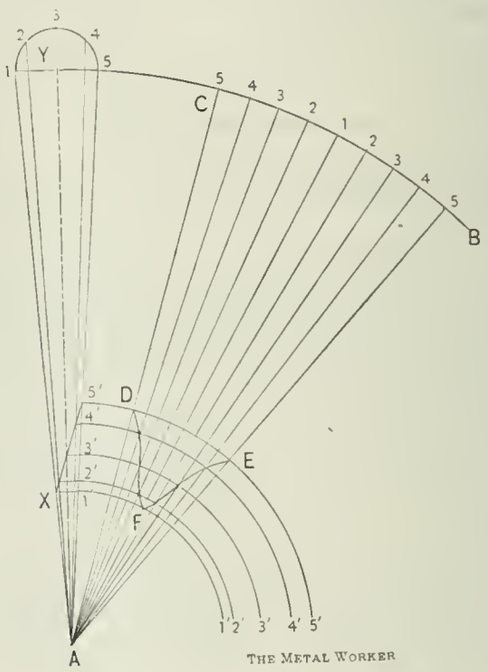

Fig. 3.—Pattern for Handle Enlarged.

2 indefinitely, as shown. Now at right angles to O P in side view in Fig. 1 and through the intersection Y draw a line intersecting the sides of the handle at 1 and 2. Now take the distance from Y to 1 or 2 and place it in Fig. 2 from *e* to 1 and *e* to 2. Through 1 *d* 2 *c* draw the ellipse, through which the handle will pass.

In Fig. 3 is shown the method of obtaining the pattern for the handle, which has been drawn on a slightly enlarged scale to better show the principle. Let A 5′ 5 1 *x* be a reproduction enlarged of O C S R T in side view in Fig. 1. Place the semicircle 1 3 5 at the end of the handle in Fig. 3, which divide into equal spaces, as shown by the small figures 1 to 5. From these points at right angles to 1 5 drop lines intersecting the base line 1 5, as shown. From these intersections draw lines to the apex A intersecting the line X 5′, as shown. From these intersections at right angles to the center line 3 A draw lines intersecting the side of the handle 5 A at 1′ to 5′, as shown. Now with A as a center and radii equal to A 5, A 5′, A 4′, A 3′, A 2′ and A 1′ draw arcs, as shown. Draw any radial line, as C A. From C on the arc C B step off twice the number of spaces shown in the semicircle Y, as shown by the small figures 5 to 1 to 5 on C B. From these points draw lines to the center A intersecting arcs having similar numbers, as shown. Trace a line through these intersections, as shown by D F E. Then will C B E F D be the pattern for the handle.

P in Fig. 1 shows a button on the handle slightly

raised, on which a wire riug can be fastened to hang up. The wire ring can be fastened as shown in diagram A¹, Fig. 1, in which *a* is the raised button, *b* the wire ring, around which a strip ¼ inch wide, shown by *c*, is fastened. A slit ¼ iueh wide is eut into the button with a small ehisel, the strip passed through and turned over, as at *c*, whieh completes the pan.

The corners can be double seamed, and the edge wired or a hem edge put on, if so desired.

Stove Pipe Statistics.

Some curious statisties on the amouut of human energy expended in the manufaeture of stove pipe were recently given to a representative of the *Press* of Carthage, Mo., by Frank Stephens, an expert sheet metal worker in the employ of Keim & McMillan of that eity. "Few realize," said he, "the amount of work required to make one joint of stove pipe. I have figured the amount out about this way:

"The first thing the sheet iron is unloaded ou our back walk, put on the elevator, hoisted to the third floor, unpaeked and put on the cutting bench. Then it requires two motions of the feet and four more of the arms to cnt each joint, four motions of the arms to edge, eight revolutions of the erank to form it, four of the arms to feed the rollers, six motions to operate the grooving maehine, four motions of the arms and six strokes of the hammer to rivet it; four motions of the arms and four revolutions of the erimper erank, six more to join two joints together (to see if they will fit) aud four more motions to pnt them on the shelf.

"Thus there are 56 motions required for eaeh and every joint. Our yearly output for eaeh fall is about 20,000 joints, which represents 1,120,000 motions of the human body. A joint of 6-inch pipe is 20 ineches wide, 24 inches long and contains 280 square ineches, eonsequently the output of 20,000 joints requires 5,600,000 square inches of steel surfaee."

The Sparse Distribution of Tin.

A writer in one of the recent publieations of the Geological Survey of Australasia, quoted in the *Journal of the Franklin Institute* of Philadelphia, ealls speeial attention to the singular faet—well known to metallurgists though not to the non-expert—that tin is the most sparingly distributed metal in common use. While there is scarcely a eountry in the world in which gold might not be profitably obtained, or from whieh it has uot been obtained in the past, there are at the present time probably not more than a dozen distriets in the world from whieh tin is obtained. The tin deposits of Cornwall, famed in history as the souree from whieh the Phœnicians obtained their tin supplies and whieh have yielded immense quantities eontinuously down to the present time, are now practically exhausted, and the same may be said of the condition of the ore deposits of Bohemla, Tuseany, Southern Spain and the Pyrenees.

In all the vast area of Asia but two distriets are known in whieh workable deposits of tln exist—namely, the Hunan district of China and the Straits Settlement and adjaeent prineipalities, from the latter of which by far the largest quantity of the metal has been obtained for many years.

Thus far no workable tin deposit has been discovered in Africa. In North Amerlca at present there is not a single tin mine in operation, though promising deposits have been located in at least three widely separated localities—viz., Vlrginla, Dakota and Callfornla, which, however, proved unprofitable. In Mexieo extensive deposits of tin are known to exist in the provinee of Durango, whieh one day, when faeilitles for transportation are provided, will doubtless add greatly to the world's supply. At present, however, they remain untouched. Brazil, Bolivia and Peru, in South Amerlea, have paying tin ground, but the yield thus far is comparatively small and is eonfined to the two last named States. Lastly, Australasia is the souree of a eonsiderable supply of tin from lately diseovered deposits ln Australia and New Zealand. At present the product is only about one-tenth that of the Straits, but it is increasing.

HISTORIC WEATHER VANES.

A eentury or two ago weather vanes were held in higher estimation aud were more generally used than at the present time, when the daily papers give a forecast of the weather—correet or not, as may be—for several days in advance. No little skill and taste were displayed in the design and construction of these vanes, as may be readily seeu from the two historie specimens now in the possession of the Washington Association, at Morristown, N. J., and whieh are shown in the aeeompanying illustratiois. Fig. 1 represents a weather vane that was used on the estate of Lord Stirling, at Somerville, N. J. Whlle lt probably oeeupied a neutral position in the matter in dispute between the Continental troops and King George's soldiers, like many other non-eombatants, it did not escape injury. The two bullet holes shown in the tail of the vane are mementos of its experience in the little exehange of eompliments that took place in

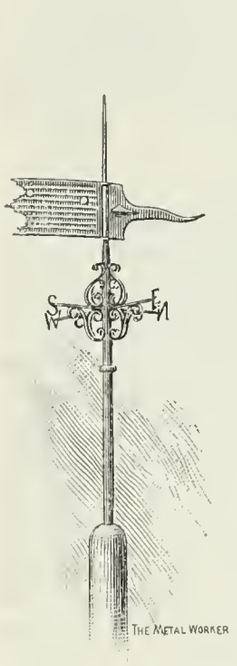

Fig. 1.—Lord Stirling's Vane.

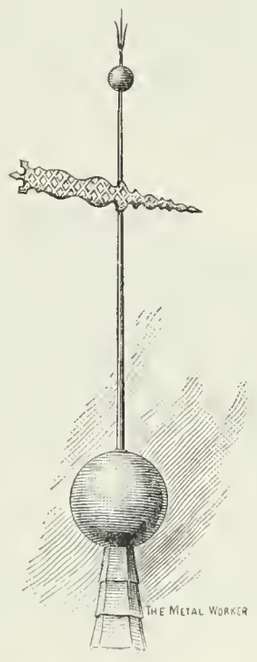

Fig. 2.—The Old Church Vane.

Historic Weather Vanes.

1777. The staff supports an ornamental irou construction, whieh gives the points of the compass.

The seeond vane, shown in Fig. 2, did service on the top of the First Presbyterian Chureh of Morristown, from 1791 until reeently, when the new ehurch was built. It is preserved as a relic at the "Headquarters" maintained by the Washington Association ln the suburbs of Morristown, where many other historie relies are also preserved and on view. Partieularly interesting to readers of *The Metal Worker* would be a visit to the old kitchen of the headquarters, with its equipment of a century and a quarter ago, and also the dining room and parlor with the antique fire baeks, which were among the first manufaetured in the United States. The vane in Fig. 2 still rests in the apex of the old ehureh steeple, whieh was sawed off several feet below the top. A few feet above the wood work is a eopper ball. Our temperanee readers will find pleasure in the faet that this ball was made from three distillers' kettles. It still retains a remarkable trueness of form, testifying to the skillful handieraft of the eoppersmith who produeed it. Above the ball is a weather vane, iu the design of whieh the enrved line of beauty has been used with considerable taste. Above the vane is another eopper ball. The upper ball is probably 9 inches ln diameter, whlle the lower ball is about 2 feet ln dlameter. The top of this spire terminates ln au graeeful trident.

The Interstate Roofing Company.

We have received from the Interstate Roofing Company, Anniston, Ala., a copy of a circular letter dated February 12, announcing that they have succeeded to the roofing and heating department of the Anniston Supply Company. The latter company, in which the present members of the Interstate Roofing Company owned two-thirds of the stock, operated in two lines of business—viz., selling mill and furnace supplies and contracting for roofing, sheet metal cornice work and steam heating. The business having grown to considerable proportions it was deemed advisable to divide it. John H. Frye and G. G. Britton accordingly sold their stock in the supply company and purchased their roofing, metal cornice and steam heating business, which in future will be handled by the Interstate Roofing Company. Attention is called to the fact that the management of these lines under the new company continues the same. G. G. Britton, who handled the roofing business for the Anniston Supply Company for ten years, will continue in charge of this work. The business of the concern in this line has grown in ten years from being a purely local one until at the present time it covers four States. A new line, which is being handled by L. F. Bellengrath, is contract steam heating and sprinkler work. The company are financed by John H. Frye, who was the largest stockholder of the supply company. The officers of the new concern are John H. Frye, president and treasurer; G. G. Britton, vice-president and manager, and John R. Sweets, secretary.

Abolishing the Mill Committee.

According to Theodore Shaffer, president of the Amalgamated Association, a recommendation will be made at the annual convention of the organization, in Wheeling, W. Va., in May, for the total abolition of the "Mill Committee." The Mill Committee is the mill representation of unionism and settles all disputes between the men and the officials, unless they are so serious that a general strike is ordered. It has been claimed that where members of this Mill Committee are biased or inclined to be unjust they can cause no end of trouble to the manufacturers and keep the mill in a state of disorder all the time. The plan is to substitute for this committee a salaried district official, who is to go to all mills and settle all disputes as the representative of the men. This change will be one of the most radical that the Amalgamated Association has ever attempted.

Waterbury Brass Company.

Waterbury Brass Company, with factories at Waterbury, Conn., have lately moved their New York branch to 122-130 Centre street, where they occupy the two lower floors of the building, which is 72 x 100 feet in dimensions. This step has been taken in view of the large increase in their business, and the materially larger quarters now occupied will enable them to carry a much more complete stock than ever before, thus putting them in an excellent position to fill orders promptly and efficiently. In addition to sheet brass, brass wire and rods, German silver sheets, rods and wire, &c., they have added seamless drawn brass and copper tubes, including iron pipe sizes, and intend soon to install a complete stock of cornice copper and hot rolled copper, as well as braziers' sheets. They will also carry yellow metal rods of all sizes. In addition to their sheet metal, rods and wire they will handle finished goods, such as eyelets, special brass wares of various descriptions, including also shells and brass ferrules. The new quarters have been laid out with special care and are admirably adapted to the requirements of the business. The offices are finely equipped and the whole establishment reflects much credit on the company. It is hoped that all friends of the company will make this store their headquarters when in New York, where they will find every convenience and courtesy extended to them.

This company were incorporated in 1845 and received a special charter in 1881. Their New York branch was established in 1846 at 15 Platt street, where they remained for several years, when they moved to 14 Platt street, directly opposite. Here they continued until 1856, when they removed to 52 Beekman street, where they were located for a period of 20 years. The business was then moved to 296 Broadway, where they remained another 20 years. The company then located at 60 Centre street, where they continued until recently, although these quarters were inadequate from the first. During all these years the business steadily expanded, necessitating with each removal increased space for the accommodation of their business.

During the past 38 years the New York store has been under the efficient management of John Sherman, who has been associated with the company since the opening of their branch in this city, a period of more than 54 years, and who is widely and favorably known in the trade. Mr. Sherman will continue to identify himself with the New York house, but he will not be so actively connected with its management as heretofore.

General Fire Proofing Company.

The General Fire Proofing Company of Youngstown, Ohio, have been incorporated with a capital stock of $500,000. The officers are Myron I. Arms, president; W. H. Foster, secretary, and W. A. Kingsley, treasurer and general manager. The new concern have purchased the business of the International Metal Lath Company of Niles, Ohio, and the plant will be removed to Youngstown to be rebuilt on a larger scale and operated in connection with a new works, to be built by the new concern. The company will manufacture general fire proofing and the Herringbone expanded metal lath. The building to be erected will be of steel and brick and the entire plant will be completed with modern machinery throughout. W. A. Kingsley, who is treasurer and general manager, was formerly at the head of the Pomeroy Iron & Steel Company. W. H. Foster, who is secretary, holds the same position with the Youngstown Iron, Sheet & Tube Company. The General Fire Proofing Company and the Youngstown Iron, Sheet & Tube Company, although two separate and distinct concerns, will work very closely together, much of the output of the Youngstown Iron, Sheet & Tube Company being consumed by the General Fire Proofing Company. Work on the new plant will be started as soon as necessary plans can be made.

May Erect Sheet and Tin Plate Plant.

The Marietta Sheet Steel & Tin Company, a concern projected by Laken C. Taylor of Cambridge, Ohio, and others, intend building a sheet steel and tin plate plant upon a site recently secured east of Norwood, a part of Marietta, Ohio. The plant is to contain four hot mills and is to cost about $150,000. A large tract of land, upon part of which the mills are to be located, has been purchased and will be named East Norwood. This has been arranged in plots, and according to the contracts signed with the Marietta Board of Trade, as soon as the requisite number of lots have been sold the company to commence the erection of the mills, and 30 days after completion are to receive a bonus. If the project is successfully launched the Marietta Electric Company, whose power house is located at Norwood, are to extend their line to the new works. The Government dam, just below Marietta, the construction of which has already been provided for, will give water facilities, and running through the tract are the tracks of the Pennsylvania Railroad.

The Frank Mossberg Company, Attleboro, Mass., are sending out an illustrated pamphlet calling attention to their Bicycle Bells, Automobile Bells, Sterling Wrenches and Eagle Pipe Wrenches. The company are prepared to design and construct any kind of special Tools and Dies for sheet metal stampings. They also have a machine shop for the manufacture of special Machinery and Tools for light work, and have installed a complete modern equipment for the purpose. The company are making a specialty of the development of experimental machines. In addition to manufacturing Dies and Tools for sheet metal stamping they are prepared to contract for the manufacture of the finished product from such machines.

THE INDEPENDENT SHEET MILL MEETING.

A second meeting of the independent sheet and black plate mills convened in the Hotel Lincoln, Pittsburgh, on Tuesday and Wednesday of this week. About a dozen or more concerns were represented in person, while three or four of the independent sheet mills were not present. The call for this meeting was sent out on February 11 by A. F. Baumgarten, vice-president of the Maryland Sheet & Steel Company of Cumberland, Md. An organization was effected by the election of W. L. Glessner of the Laughlin Nail Company, operating a sheet mill at Marin's Ferry, Ohio, as president, and A. F. Baumgarten, secretary.

The principal question discussed was the advisability of the independent sheet mills building a basic open hearth steel plant to supply their own steel and make them independent of the market. It was the opinion of some of the independent sheet mills that for each individual mill to build a small open hearth plant is not a wise policy, for the reason that when a reaction comes in the iron trade, as it will some time, the cost of making steel in so many small plants will be so high that the investment will not be a profitable one. It was contended that if the principal sheet mills would go together and build a large open hearth plant with their own blast furnaces, they would be in position to make steel as cheaply as any of the large steel plants that are now in operation.

It was further proposed to make the price of sheet bars the same at all the mills that would have stock in the steel plant, putting them all on an equal basis as regards cost of their bars. However, a few of the sheet mills that now have their own open hearth steel plant, and others that are covered on sheet bars for some months ahead, are not favorable to the project, and the ultimate action to be taken in regard to the matter is still in doubt.

The Biersach Fire Proof Window.

Biersach & Niedermeyer, Milwaukee, Wis., are manufacturing a fire proof window under a patent recently granted to Louis D. Biersach. This fire proof window covers a special construction of the window frame and the sashes. The window frame is so designed that portions of it may be readily removed for the purpose of reaching the sash balance weights and cords. The frame is further so constructed that the sashes are held and guided when raised or lowered by non-corrosive flanges and grooves. In the third place, a special arrangement is employed for forming a tight joint at the upper and lower edges of the sashes. The removable plate arranged for the purpose of reaching the weights and cords is formed with two recesses or grooves which receive sheet brass or other non-corrosive guiding flanges, which are so folded that the outer edge presents a smooth rounded surface upon which the bearings of the sash can slide. Grooves on the sash are arranged to correspond with these flanges, and are provided with a brass or similar non-corrosive bearing surface or lining. Gulding flanges of fire proof sashes and window frames have heretofore usually been formed of one continuous piece with the galvanized sash and frame, and the parts thus constructed are liable to rust and break, especially owing to the fact that when galvanized iron is bent at the sharp angles necessary to form beads and grooves the galvanized surface peels off and the metal is soon destroyed by rust. The close joints at the upper and lower edges of the window sash are secured by the construction of similar sheet brass flanges which enter corresponding grooves. Special means have also been devised for holding the glass in the metal sashes and for easily slipping the glass into place.

The Midland plant of the American Sheet Steel Company, at Muncie, Ind., is being equipped with special machinery for the manufacture of high grade Sheets. A new trimming house is also being erected and the plant is being materially improved in a number of directions. It is at present almost wholly devoted to the production of specialties in Sheets.

FLASHINGS.

Citizens of Elwood, Ind., are reported to be organizing a company for the erection of Tin Plate works at Kokomo, Ind., on a site near the new Steel mill at that place.

The Consumers' Can Company, Baltimore, Md., who were recently reincorporated with a large increase of capitalization, are reported to have made more sales since the first of the year to date than were made by the company in the entire season last year. E. F. Kirwan is president of the concern. The company are the strongest competitors of the American Can Company at the present time.

Oliver H. Burgham, formerly superintendent of the Humbert plant of the American Tin Plate Company, at South Connellsville, Pa., who has been transferred in a similar capacity to the company's mills at New Kensington, Pa., was presented by the South Connellsville Lodge of the Amalgamated Association with a fine gold watch as an expression of the esteem of his former associates. Mr. Burgham is succeeded as superintendent of the Humbert plant by W. Jones.

It is announced that the report referring to an agreement between the Amalgamated Association and the American Steel Hoop Company and the Republic Iron & Steel Company to operate the mills continuously pending the adjustment of the wage scale, is incorrect so far as it included the American Steel Hoop Company.

Thomas Reese, vice-president of the Amalgamated Association of Iron, Steel and Tin Plate Workers for the Niles district of Ohio, died on February 9. He is survived by a widow and two children.

The Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, have acquired 40 acres of land at Struthers, Ohio, where their new plant is under erection. The property has been purchased in order to provide sufficient room for extensions to the company's plant, which may be required in the future. The concern are now in possession of 172 acres of land at Struthers. The Bar and Sheet mills of the new plant were placed in operation last week and the puddle furnaces will shortly be started.

John Schwing. Bridgeport, Conn., has made a fine metal sign for the new store of Foster, Besse & Co. The letters are made of metal covered with gold leaf, and are of such a size that they can be readily seen for more than a block in the distance. Mr. Schwing is also putting the sheet metal work on the new St. John's Church in Bridgeport.

W. T. D. Hardesty, superintendent of the Falcon Mills of the American Sheet Steel Company, at Niles, Ohio, has been appointed division superintendent and will have charge of the company's plants at Niles and Struthers, Ohio. Charles L. Thomas has resigned the superintendency of the Struthers plant. He is succeeded in the local management of that plant by W. H. B. Ward of Niles.

The foundry of the Frank-Kneeland plant of the United Engineering & Foundry Company, at Pittsburgh, is to be enlarged by an addition of 100 x 100 feet.

The G. Drouve Company, Bridgeport, Conn., have the contract for the sheet metal and copper work for the residence of Charles Mallory, at Port Chester. The company are also making the Cornices and Skylights for the new Art Gallery Hall in Southamptou, L. I.

The plant of the Waukesha Sheet Steel Company, Waukesha, Wis., recently completed, is to be increased to 12 Sheet mills, trebling the present capacity. There will also be added four galvanizing pots, a Bar mill and a corrugating department, contracts for the necessary equipment of which have already been placed. The company have recently been obliged to shut down a portion of their capacity on account of lack of fuel.

H. Weiss & Co., 20 Cliff street, New York, are sending to the trade a circular devoted to the Superior Tinners' Gas Soldering Furnaces, adapted for either artificial or natural gas, and made with either one or two burners, one provided with a cover at the top for melting metals. The circular also shows a Bending Machine

adapted for the use of cornice makers. This machine will bend all kinds of metal bars to a circle, bevel, ogee or square. The machine is said to have a capacity of bending heated angle or tee bars 1½ and 1¼ inches and smaller sizes of metal cold. The machine can be regulated by two thumb screws.

James E. Kelley & Son, gravel roofers, New Haven, Conn., have just completed a number of important contracts throughout the State, among them being the following: Connecticut State Prison, Wethersfield; block for Samuel Taylor, Hartford, and the Union Metallic Cartridge Company, Thomas P. Taylor's block, Connecticut Web Company and the Nichols block, all of Bridgeport.

Henry Weyand, Waterbury, Conn., has the contract for the sheet metal work on two buildings in course of erection at Torrington by George L. Lilley.

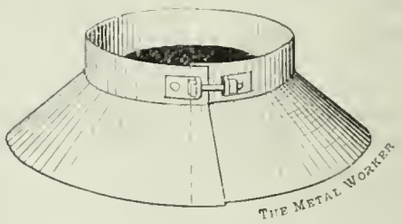
The American Sheet Steel Company, New York City, contemplate some substantial repairs to the W. Dewees Wood plant, at McKeesport, Pa., and will replace with new mills some of the worn out machinery. The work of improvement, however, will be of a modest character.

The report that the American Rolling Mill Company, at Middletown, Ohio, had recently bought a plant at Sandwich, Ill., is incorrect. This works was bought by the American Rolling Mill Company of Chicago. The American Rolling Mill Company of Middletown operate at that place a basic open hearth steel plant and Bar mill. They roll Black and Galvanized Steel Sheets, Service Pipes, Sheets and Sheet Steel Building Material of all kinds. George M. Verity is president and general manager; W. T. Simpson, vice-president; R. C. Phillips, secretary, and James B. Strawbridge, general superintendent. Mr. Strawbridge was formerly connected with the Pittsburgh Tin Plate Company, at New Kensington, Pa., prior to that plant being taken over by the American Tin Plate Company.

We have received from the Maire Paint Company, 242 First avenue, North, Minneapolis, Minn., a package of advertising matter calling attention to Maire's Indestructible Roof Preserver. This preparation is adapted for use on iron, wood, tin or metals of all descriptions. It is claimed to be a perfect protector and preserver, which will not crack, peel nor blister, and is guaranteed to stand any climate. The Preserver is described as being made entirely of minerals and contains no oil. It is recommended for stopping leaks, rust and decay on a roof, and is claimed to be unaffected by acids, gases or fumes. Only one coat is necessary on most surfaces. Attention is also called to Maire's Roof Cement for stopping leaks in roofs, and to Maire's Smoke Stack Preserver and Boiler Preserver for boilers, steam pipes and other hot surfaces. The company are also manufacturers of the Hercules and Climax Mineral Paints and the M. P. C. Prepared Roofing.

As the season is approaching when special attention is paid to leaks and defects in roofs that have been developed by the winter storms, George Callahan & Co., 218 Front street, New York, use the opportunity to call attention to the Elastic Paint Oil and Roof Cement, of which they are the manufacturers. These goods, they state, are highly recommended by all who have used them. Tinners and roofers are realizing the importance of having an oil that is elastic to withstand contraction and expansion in the metal used for roofing purposes. The Elastic Paint Oil takes the place of Linseed Oil for roofing purposes at a less cost. It requires no drier or thinner, and is immediately ready for use. The Oil has been on the market for eight years and the demand for it is constantly increasing. The fact that Callahan's Rubber Roof Cement can be readily applied to a wet roof gives that material a great advantage over other preparations for roof mending purposes. The fact that it has maintained its reputation for 15 years speaks highly in its favor.

A general strike of workmen is threatened in Italy. Labor meetings on a large scale are being held in Rome and other cities and the Government has taken extraordinary military precautions to preserve order.



THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

COST OF FLANGES AND VENTILATOR.

From C. A. H., West Point, Neb.—In reply to the inquiry of "R. & B." in *The Metal Worker* of January 25, I would say that if they first cut the pattern for the roof flange it will be an easy matter to estimate the price for making the job, as they will then be able to tell within a few ounces how much material will be required. Then, certainly, any experienced tinner should be able to estimate how long it would take to make a roof flange of this kind, and also the ventilator, as shown by the sketch. In regard to riveting a small flange to a smoke stack, I would advise "R. & B." not to do it. A far better way is to make the small flange open and rivet to the top edges two angle irons, with holes through which a bolt can pass to draw the flange tight around the smoke stack by means of a set nut. The flange can

Cost of Flanges and Ventilator.

be made a little longer than is necessary, so that the ends will overlap, and the opening can be left at the back, or anywhere most convenient. I have tried this plan and know it works to perfection.

CAN ALUMINUM CASTINGS BE SOLDERED?

From E. S., Mahwah, N. J.—Will *The Metal Worker* or some of its readers advise me as to whether there is any method by which aluminum castings may be soldered? We understand that there is a solder which can be used for this purpose, but have been unable to find out its nature. Any information you can give us on this subject will be greatly appreciated.

MAKING SEWER CONNECTIONS.

From H. W. C., Elizabeth, N. J.—Please advise me if it is good practice to tap a trunk sewer in the manner described by "J. N. S." in *The Metal Worker* of February 1? I have always considered it better to tap the sewer below the turn of the arch.

Answer.—In all probability it was the intention of our correspondent to show the connection at the turn of the arch, and the slight variation in presenting the sketch may differ from his views on the subject. However, there can be no doubt that it is better to tap the sewer too high rather than too low, the main object being to keep the house drain as far as possible below the surface of the ground to avoid the effect of frost.

THE DURHAM SYSTEM OF HOUSE DRAINAGE.

From B. F. L., Stockton, Cal.—Will *The Metal Worker* be so kind as to inform me as to the character of the Durham system of plumbing?

Answer.—The Durham system of plumbing consists of the use of wrought iron pipe for the house drainage system and special fittings instead of the usual cast iron pipe fittings. These fittings have the same diameter on the inside as the inside diameter of the pipe, a recess being made at the ends for the threads for connection with the pipes.

WHO MAKES SELF FEEDING FURNACES?

From Great Falls Hardware Company, Great Falls, Mont.—We have a call here for a self feeding hot air or combination hot air and hot water furnace. We desire to learn the address of the manufacturers of such goods in which soft coal may be used.

PATTERN FOR TRANSITION PIECE.

From E. G. R.—Would you kindly explain the method for cutting the pattern for a transition piece round at one end and rectangular or square at the other? In this case the round end is 14 inches in diameter, and the other end 8 x 12 inches by 10 inches high.

Answer.—In Fig. 1 let A B C D be the diameter of the round end, shown in elevation by E F, and G H I J the plan of the rectangular end, shown in elevation by K L, the hight of the article being 10 inches, as shown by *a b*.

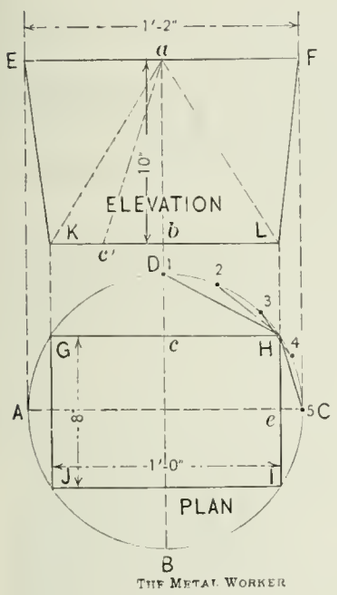


Fig. 1.—Plan and Elevation.

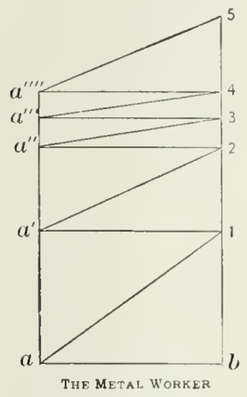

Fig. 2.—Diagram of Triangles.

Draw the diameters A C and B D in plan, as shown. As the rectangular opening is central over the circle, it will then only be necessary to obtain the quarter pattern, *c* D H C *e* in plan, and then join four of these patterns together for the whole pattern. Therefore, divide the quarter circle, D C in plan, into an equal number of spaces, as shown by the small figures 1 to 5, and from these points draw lines to the corner H, as shown. Then will these lines represent the base lines of triangles, which will be constructed, whose altitudes are equal to *a b* in elevation. For the diagram of triangles proceed as shown in Flg. 2.

Draw any horizontal line, *a b*, equal to the hight of *a b* in elevation in Fig. 1. At right angles to *a b* in Fig. 2 and from points *a* and *b* draw vertical lines indefinitely, as shown. Now take the various distances in plan in Fig. 1, H 1, H 2, H 3, H 4 and H 5, and place them on the vertical line in Fig. 2, as shown from *b* to 1, 1 to 2, 2 to 3, 3 to 4 and 4 to 5 respectively. From these points at right angles to 5 *b* draw lines intersecting the vertical line *a a''''* at *a'*, *a''*, *a'''* and *a''''*. Then draw the slant lines 1 *a*, 2 *a'*, 3 *a''*, 4 *a'''* and 5 *a''''*, respectively, as shown, which will represent the true distances on the finished article on similar numbered lines in plan in Fig. 1.

As F L in elevation represents the true flare on C *e* in plan, then obtain the true flare on D *c* in plan by taking the length of D *c* and placing it as shown from *b* to *c'* in elevation. Draw a line from *c'* to *a*, which will give the true flare.

For the pattern draw any line, as 1 *c* in Fig. 3, equal in length to *a c'* in elevation in Fig. 1. Now take the distance from *c* to H in plan, and place it at right angles to 1 *c* in Fig. 3, as shown by *c* H, and draw a line from H to 1, which should be equal to *a* 1 in Fig. 2. Now with radii equal to *a'* 2, *a''* 3, *a'''* 4 and *a''''* 5, and using H in Fig. 3 as center, describe arcs 2 2', 3 3', 4 4' and 5 5', as shown. Now set the dividers equal to the spaces in the quarter plan D C in Fig. 1, and starting at 1 in Fig. 3, step from one arc to another having similar numbers until the point 5 has been obtained. Trace a curve through the points 1, 2, 3, 4 and 5, and draw a line from 5 to H. Now with H *c* in plan in Fig. 1 as radius and H in Fig. 3 as center describe the arc *e*, which intersect by an arc struck from 5 as center and F L in elevation in Fig. 1 as radius. Draw a line, in Fig. 3, from 5 to *e* to H. Then will 1 5 *e* H *c* be the quarter pattern. If the half pattern is desired trace opposite the line 5 *e*, as shown by 5 1' *c'* H' *e*. If the pattern is required in one piece trace opposite the line 1 *c*, as shown by 1 1" *c"* *c*.

INK FOR MARKING TINWARE.

From C. A. H., West Point, Neb.—Will *The Metal Worker* or some of its readers give me a receipt for making an ink for using to mark tinware?

Note.—A good ink for marking tinware is made by reducing asphalt or black varnish with turpentine to the desired consistency. It should be kept in a corked bottle, and, when wanted for use, the bottle should be shaken thoroughly. On withdrawing the cork enough of the marking fluid will adhere to it so that when the pen is applied to the cork it will fill with the fluid. This ink can be used for marking any bright article, as well as tinware, and it can be removed by means of a cloth dipped in coal oil or turpentine. Another ink is made by reducing shellac varnish with alcohol and adding a sufficient quantity of the finest lamp black. This forms a jet black lusterless ink, which is insoluble in water, but can be removed by a drop of alcohol.

A QUESTION OF BOILER POWER.

From G. D. H., New York.—In reply to the inquiry of "T. N. R." in *The Metal Worker* of February 15 I would calculate as follows: If the boiler is rated at 10 horse boiler power, or equal to an evaporation of 35 pounds of water per nominal horse-power per hour, it should supply 3600 feet of 1-inch pipe used as radiating surface in a heating chamber for evaporating moisture from goods; which I infer is meant by your correspondent. Much depends upon the size of the chamber and its required temperature and ventilation as to whether the capacity of the boiler will supply a greater or less quantity of radiating surface than above stated.

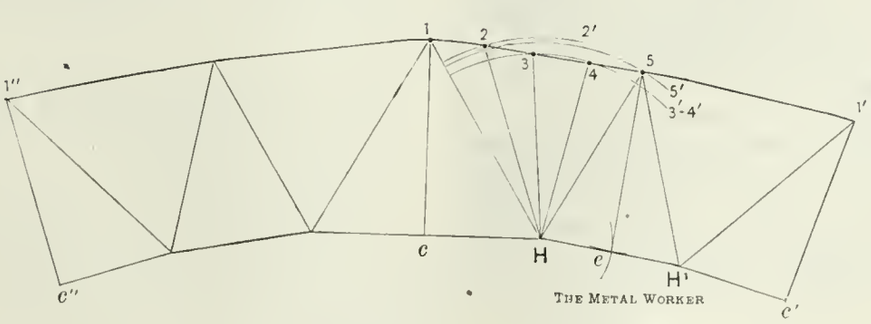

Fig. 3.—The Pattern Shape.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin has advanced ¼c., and is in light demand.

Copper has declined about ¼c.; buying is tame.

Pig Lead is in good demand and firm in price.

Spelter has stiffened about ⅛c., but demand is light.

Antimony is unchanged.

Nickel is in good demand at former prices.

Aluminum is active at unchanged prices.

Tin Plates are firm and without new feature.

Sheets are very strong and active.

Sheet Bars are very scarce, and prices tend upward.

Sheet Copper is in good demand and firm in price.

Scrap Iron is active and higher in price.

Foundry Iron is becoming very scarce, and prices are higher for spot.

Hardware is in good demand, with prices well maintained.

Cast Iron Soil Pipe and Fittings are strong, with probability of an advance in prices.

Galvanized Range Boilers are active and firm, and higher prices may be made before long.

Sanitary Earthen Ware prices have been reaffirmed for another year.

Sash Weights are firmer.

Wire Nails are active and firm.

Cut Nails are steady in price

Window Glass may advance in price.

White Lead is in good demand and prices well maintained.

Linseed Oil is more active with prices firm.

METAL MARKET.

New York, February 21, 1902.

Pig Tin.—Controlling influences in London have brought about another sharp advance in that market. The rise in London had very little effect on this market, however, as prices here have persistently remained below the parity of London quotations. Business here is very slow, most of the consumers being supplied for some months to come. Jobbers' prices rule about ¼c. higher than those of a week ago, Straits Pig, in small lots being quoted at 25¾c. to 26¼c. per lb.

Copper.—Business is very quiet. It is apparent that the consumers are well supplied at low prices, as no business whatever is being transacted for consumptive account. Interest is centered solely in the sparring of the speculators, who have a good supply on hand and are bickering among themselves in an endeavor to unload. There are a good many resales in the market, but owing to the general dullness the metal is not disposed of. When the market looks soft offers are freely made, but as soon as matters stiffen up slightly these offers are withdrawn. The wholesale market price declined about ½c. since last week. Lake Ingot, in small lots, rules at 13¼c. to 13¾c. per lb., and Casting Copper at 13¼c. to 13½c.

Sheet Copper.—The demand for Sheet Copper keeps up in good volume and prices rule firm on the basis of 18c. per lb. from store.

Pig Lead.—A good demand for Lead is reported, and the metal is firm at unchanged prices. Jobbers quote American Pig in small lots at 4.45c. to 4½c. per lb. It is reported that the American Smelting & Refining Company have announced that hereafter no stock of Lead will be carried in New York. In this way nothing better than prompt shipments from the West can be obtained by consumers here. This move is looked upon as another step to force the consumer to carry the surplus stock. While prices were at a fixed basis, with no inducements for the consumers to carry stock, they have simply purchased spot according to their immediate requirements. The present tactics, it is hoped, will bring back transactions in futures. St. Louis advices report a halting tendency in the Lead market at that point with prices showing no change.

Spelter.—The market on Spelter is somewhat firmer. There is, however, a noticeable lack of demand, consumers apparently being well supplied. Retail prices rule at 4½c. to 4⅝c. per lb. for small lots. St. Louis advices indicate that sales are light in the Spelter market, and the price movement is within narrow limits.

Sheet Zinc.—The demand for Sheet Zinc is about of average volume. Jobbers quote 600-lb. cask lots at 6¾c. per lb., and smaller quantities at 7¼c.

Antimony.—There has been no change in this market. Hallett's and U. S. in small lots are quoted at 8¼c. to 8¾c., and Cookson's at 10¼c. to 10¾c. per lb.

Nickel.—The market is unchanged, small lots being quoted at about 55c. to 60c. per lb.

Aluminum.—The demand for Aluminum continues active and prices remain at the level they have held for a long time past. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates is entirely unchanged. The larger consumers are filling their wants for the first half of the year at present prices, and a fairly active demand from smaller consumers is reported in this market by jobbers. Retail prices are unchanged. American Bessemer Coke Plates, IC, 14 x 20, in small lots, delivered at New York and corresponding points, are selling at about $4.80 to $5 per box. Supplies from mills are coming in rather more freely, but there is no superfluity of Plates in this market. In fact some of the more popular lines are still scarce to obtain for spot delivery. A further advance of 1½ pence per box took place this week in the price of Welsh Plates.

Sheets.—The meeting of the independent Sheet mills, held this week in Pittsburgh, is reported in another column. An active demand is noted for both Black and Galvanized Sheets. The Sheet mill capacity of the country is fully employed on orders sufficient to keep the mills running for the next couple of months or more. A few cases of unevenness in prices are reported among jobbers who have stocks bought when prices were lower, who in some cases are said to be naming lower prices than the mills. The market for both Black and Galvanized Sheets, as a whole, however, is very strong, and the pronounced scarcity of Sheet Bars is likely to still further strengthen the position of the finished material. Jobbers' quotations are firm and without change. No. 27 One Pass Cold Rolled Soft Steel Sheets rule at 3.90c. to 4c., and Galvanized Sheets at 67½ and 5 per cent. to 70 per cent. off the list.

Chicago advices are as follows: The situation from the standpoint of the mills is very satisfactory, as orders are improving and the independent mills are not disposed to make concessions. Heavy Sheets are particularly firm, and the most desirable orders do not tempt any departure from regular rates. Small lots of Black Sheets are selling at 3.35c. to 3.45c. The competition on Galvanized Sheets among jobbers is still sharp, but it is expected that this condition of affairs will shortly improve. The usual price on small lots is 70 and 5, but a lower rate has been made by some houses.

Old Metals.—The demand for Scrap Iron continues active on account of the scarcity and high price of Pig and prices have stiffened. Other Old Metals are moving pretty freely. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	10¾c.
Light and Tinned Copper	per lb.	9 c.
Heavy Brass	per lb.	8¾c.
Light Brass	per lb.	6¼c.
Lead	per lb.	3⅝c.
Tea Lead	per lb.	3½c.
Zinc	per lb.	3 c.
No. 1 Pewter	per lb.	15¾c.
No. 2 Pewter	per lb.	8 c.
Tin Plate Scrap, per gross ton		.... to $5.00
Wrought Iron Scrap, per gross ton		$12.75 to 13.00
Heavy Cast Scrap, per gross ton		11.75 to 12.00
Stove Plate Scrap, per gross ton		9.50 to 10.00
Burnt Iron, per gross ton		7.00 to 7.50

THE PIG IRON MARKET.

NEW YORK.—There has been a good deal of activity in this market. The Iron available at old prices is lessening in quantity from day to day, and an increasing tonnage is being placed at the higher figures, which quite a number of sellers insist upon. There is a good deal of trouble about deliveries and some anxiety concerning the next month or two. We quote for Northern Irons: No. 1, $18 to $18.50; No. 2 X, $17 to $17.75; No. 2 Plain, $16.75 to $17; Tennessee and Alabama brands, No. 1 Foundry, $16.50 to $17; No. 2 Foundry, $16 to $16.75; No. 1 Soft, $16.50 to $17; No. 2 Soft, $16 to $16.50; No. 3 Foundry, $15.50 to $15.75; No. 4 Foundry, $15 to $15.50.

CHICAGO.—Orders for Pig Iron placed during the past week aggregated a very large tonnage. These orders came from all classes of consumers and covered deliveries running through the last part of the year. Constant pressure is brought on the furnaces to ship Iron faster than the terms of the contract, and premiums of 50c. to $1 per ton are being paid for any kind of Iron available for early delivery. An advance of $1 was made this week on local Iron, but this does not check the demand. Inquiries continue to be received in great number, and the demand is the largest in the history of some of the local sales agents. The coke supply is running so short that no stock can be accumulated. We quote as follows:

Lake Superior Charcoal	$20.50 to $21.50
Local Coke Foundry, No. 1	17.50 to 18.00
Local Coke Foundry, No. 2	17.00 to 17.50
Local Coke Foundry, No. 3	16.50 to 17.00
Local Scotch, No. 1	17.50 to 18.00
Ohio Strong Softeners, No. 1	19.50 to 20.00
Southern Silvery, according to Silicon	16.90 to 17.15
Southern Coke, No. 1	16.40 to 16.65
Southern Coke, No. 2	15.65 to 15.90
Southern Coke, No. 3	15.15 to 15.40
Southern Coke, No. 1 Soft	16.40 to 16.65
Southern Coke, No. 2 Soft	15.65 to 15.90

PHILADELPHIA.—It is useless to attempt to quote prices on Pig Iron, and it is a "go-as-you-can" market. Sellers give no heed to what others may quote, but make their own prices, which depend upon when the Iron is wanted and how much can be delivered. For prompt shipment $17.75 to $18 would be quoted for No. 2 X Foundry. The outlook for more liberal supplies is by no means encouraging, owing to the shortage of cars and Coke, and the snowbound condition of many railroads. The extreme range of prices will be about as follows for Philadelphia and nearby deliveries: No. 1 X Foundry, $18.25 to $18.50; No. 2 X Foundry, $17.25 to $18; No. 2 Plain, $16.75 to $17.

PITTSBURGH.—The United States Steel Corporation have bought 100,000 tons of Standard Besemer Iron for delivery in August and September. This purchase has naturally further strengthened the Pig Iron market, and there is every indication that Iron prices will be higher. Negotiations for the importation of one lot of 5000 tons of Foundry Iron have already been closed. Foundry Iron is active and higher in price. No. 2 is sold in small lots for prompt shipment at $17, furnace. We quote No. 1 Foundry at $17.25 to $17.50, and No. 2 at $17, f.o.b. cars, Pittsburgh.

CINCINNATI.—The past week was a remarkably active one. Orders for all grades of Iron and from all classes of consumers have simply poured in from all sections reporting to the agency headquarters here. A good many orders for large lots of Iron have been booked, and at this writing the movement is unchecked. The leading Southern interest still quotes $12, Birmingham, for No. 2, while some furnaces are asking and obtaining up to 75c. advance over that figure. The general market, however, is based on a range of from $12 to $12.50, Birmingham, for No. 2. The market is very strong, and were it not for troubles in delivery would be almost an ideal one. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$15.25 to $15.75
Southern Coke, No. 1	14.75 to 15.25
Southern Coke, No. 3	14.25 to 14.75
Southern Coke, No. 4	13.75 to 14.25
Southern Coke, No. 1 Soft	15.25 to 15.75
Southern Coke, No. 2 Soft	14.75 to 15.25
Southern Coke, Gray Forge	13.75 to 14.25
Southern Coke, Mottled	13.75 to 14.25
Ohio Silvery, No. 1	17.75 to 18.25
Ohio Silvery, No. 2	17.25 to 17.75
Lake Superior Coke, No. 1	18.10 to 18.35
Lake Superior Coke, No. 2	17.60 to 17.85
Lake Superior Coke, No. 3	16.35 to 16.85

ST. LOUIS.—Actual inquiry and demand are good. Sales are of a heavier order than in recent weeks, for the very good reason that Pig Iron in any quantity gets more difficult to secure from day to day. Many furnaces are refusing to sell at the present Birmingham basis, and are expecting to realize more money for deliveries during the first half of the year. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$15.75 to $16.00
Southern, No. 2 Foundry	15.25 to 15.50
Southern, No. 3 Foundry	14.75 to 15.00
Southern, No. 4 Foundry	14.25 to 14.50
No. 1 Soft	15.75 to 16.00
No. 2 Soft	15.25 to 15.50

CHICAGO REPORT.

Scrap Iron and Steel.—Cast Scrap is in strong demand, and prices are a little higher. Rolling mill stock is not moving, as mills will not pay the prices now asked. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$13.00 to $13.50
Machinery Cast	12.00 to 12.50
Malleable Cast	11.00 to 11.50
Stove Plate (free from burnt)	9.50 to 10.00
Burnt Iron and Grate Bars	7.00 to 8.00
Sheet Iron and Hoops	7.00 to 8.00
Plow Steel	10.00 to 11.00
Breaking Stock	10.00 to 10.50
No. 2, such as Shovels, Hoes, &c	.... to 7.00
Old Boilers—whole (Iron)	6.50 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings	10.00 to 11.00
Old Gas Pipes and Boiler Tubes	11.50 to 12.00
Cast Borings	5.50 to 6.00
Turnings	11.00 to 11.50
Horseshoes	12.00 to 12.50

Old Metals.—The demand is heavy, but stocks held by local dealers are small, as the country dealers are holding for higher prices. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	9½c.
Copper Clips	10 c.
Red Brass	10½c.
Yellow Brass	8 c.
Red Brass Borings	9 c.
Yellow Brass Borings	7¼c.
Light Brass	6 c.
Pipe Lead	3.50c.
Tea Lead	3.25c.
Zinc	2.90c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.
Aluminum	20 c.

Old Rubber.—Business is light, consumers not buying to any extent. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6.40c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6½c.
Black Rubber	....	4 c.
White Rubber	....	8 c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—A continued heavy demand is reported, with much difficulty in getting shipments, because of car shortage. Nut size is very scarce. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE COTTLES HARDWARE COMPANY succeed A. J. Cottle in the Hardware, Stove and Tinware business, at Hartsville, Ind.

THE HARDWARE TRADE.

The trade in several sections is feeling the effect of severe winter weather, which tends to reduce slightly the volume of current business, which, in spite of this influence, continues large and steady. The jobbers and others who visit the rcail trade are fully occupied, their travelers sending in well filled order sheets and reporting an excellent feeling among business men at iarge. It is evident that labor is well employed, factories in almost all lines running to their full capacity and new enterprises being engaged in with a confident and liberal spirit. The demand for structural iron and the reports of architects and builders, as well as those from manufacturers and merchants, agree that building during the present year is going to be exceptionally active, as buildings of aimost all classes are being projected with unusual enterprise. The demand for Builders' Hardware is already large and beyond the capacity of manufacturers to supply promptly. There does not seem to be an immediate prospect of a change in this respect. In quite a good many iines the manufacturers are finding their factories overtaxed and delay is occasioned in the execution of orders. On the other hand, some of the factories are catching up with orders and are making shipments more promptly than for some time. In only exceptional cases is this causing anything of a softening in prices, which are given firm tone by the condition of the iron market, the large demand and the gradually increasing cost of production on account of advances which have taken place in wages. The cost of living being also materially increased as the result of the higher prices ruling for food and practicaiiy all the necessaries of iife is a fact underlying the growing cost of goods. The gradual changes in the values of Hardware during the week in review are comparatively unimportant. Changes are for the most part in the direction of a revision of quotations, which often results in the withdrawal of concessions which have heretofore been made.

NOTES ON PRICES.

Cast Iron Soil Pipe and Fittings.—The market for Cast Iron Soil Pipe and Fittings continues in a very strong position. The demand is heavy, and the output of the various foundries is pretty well contracted for for some time to come. The meeting of the Association of Manufacturers of Cast Iron Soil Pipe and Fittings, to be held on February 26, at Milwaukee, Wis., is expected to bring some important developments and the impression prevails in the trade that higher prices will be announced after that meeting, on account of the high price and scarcity of Pig Iron. Some of the Pipe foundries, especially in the South, are considerably hampered in their operations, because of their inability to secure a sufficient supply of Pig Iron. The condition of the market for the raw material holds out little prospect of relief either in the matter of more liberal supplies or lower prices for a long time to come. Consequently it is reasonable to expect an advance in the price of Cast Iron Pipe.

Galvanized Kitchen Range Boilers.—Reference is made in another part of this paper to the meeting of the Range Boiler Association in New York City this week, and to the proposition for consolidation in that industry. The association has been very successful in maintaining prices as a whole, very few cases of price cutting having come to light. The demand for Range Boilers has been active, and the outlook is favorable for a good business and remunerative prices this year. It is said that if a certain few members of the association can be definitely kept in line, new prices on Range Boilers may be announced that will show an advance over those now in effect.

Sanitary Earthenware.—The Sanitary Earthenware Association held meetings the first three days of last week, and from what can be learned the discussion of affairs became so bitter at one time that the association was on the verge of disruption. For some time past it has been a matter of common knowledge that some of the newcomers in the manufacture of Sanitary Ware have been cutting prices in order to build up business and establish their Ware. This the older established potteries tolerated for a while, because it was practiced to no great extent, and the combined output of the new concerns did not aggregate enough to cause any serious trouble, but so many new concerns have started in business recently and the cutting became so general that several of the older manufacturers thought the only remedy by which the abuse could be stopped was by disbanding the association and making an open market for Sanitary Ware. This, however, did not take place. The association has been held together and the newcomers are in. Allotments have been made which are satisfactory to everybody, forfeits have been posted, and the manufacturers have agreed to maintain prices for another year. Consequently there is little prospect of any change in price for some time to come.

Sash Weights.—The manufacturers of Sash Weights are working together with a good degree of harmony and have recently been giving careful attention to the question of the cost of production and the relation which costs should bear to the selling price. As the result of this we understand that some of them who were making exceptionally low quotations have withdrawn their prices, and the market is thus somewhat more even than heretofore. The high price of the raw material and the difficulty in many cases of obtaining it has also a tonic effect on the market.

Wire Nails.—The general demand for Wire Nails is large and active, but the recent snow storm, which greatly interfered with local transportation, caused a falling off in the store demand in New York during the week. The market is strong. Small lots of Wire Nails from store, New York, are quoted at $2.25 to $2.30 per keg.

Cut Nails.—The Cut Nail market continues firm and steady at former quotations. The local demand was somewhat interfered with by the storm during the week. Small lots from store are quoted at $2.20 per keg.

Window Glass.—The situation in the Window Glass market remains unchanged. One result of the cut in prices by the Independent Glass Company has been to restrict buying to immediate needs. While there is a possibility of higher prices being made by the American Window Glass Company later in the season, there is no evidence of increased buying. Glass from store is quoted by the Jobbers' Association at 90 and 10 per cent. discount.

White Lead.—The demand for White Lead in Oil continues good for the season, and prices are well maintained. Lots of less than 500 pounds are quoted at 6½ cents per pound, and smaller quantities at 6¾ cents.

Linseed Oil.—Buying in Linseed Oil has been more active for the past two weeks. Prices which have been in force since January 29 continue to rule. Small lots of City Raw are quoted at about 64 cents per gallon, and Boiled Oil at 65 cents.

TRADE NOTES.

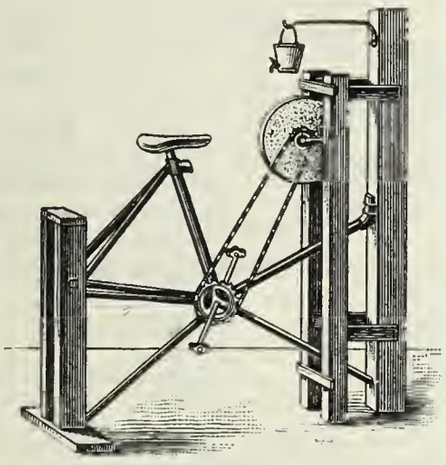
The Maydole Hammers form the subject matter of an illustrated catalogue of 40 pages that has just been issued by the David Maydole Hammer Company, Norwich, Chenango County, N. Y. The illustrations in the catalogue are beautifully done in natural colors, and show the large variety of Crucible Cast Steel Hammers manufactured by the concern, the reputation of which is world wide.

E. W. Putnam, Hartford, Conn., Pattern and Model maker, is very busy at his plant. Mr. Putnam learned the trade with the United States Rolling Stock Company, and was for 12 years with the Pope Mfg. Company and the Pratt & Cady Company. His shop is fully equipped with modern tools and is centrally located at 187 Pearl street. Mr. Putnam started in business last December and is now employing six experienced men.

The factory of the Hamden Corundrum Wheel Company, Springfield, Mass., was almost entirely destroyed by fire February 16. The loss, about $50,000, is mostly

covered by insurance, and the plant will probably be rebuilt.

Joseph T. Ryerson & Son, 18 to 22 Milwaukee avenue, Chicago, have established an office at 22 and 24 State street, foot of Broadway, New York City. This has been found necessary on account of the rapidly growing Eastern business of the house, particularly on specialties in which they have built up a large trade throughout the United States and Canada.



The Amalgamated Graphite Company of New York have been incorporated with a capital of $400,000. The principal office of the concern is at Johnsburg, Warren County, N. Y. The directors are: Wilber F. Whitney of South Ashburnham; Robert Simpson, O. O. Greenwood, S. D. Rowland and Marcella Greenwood of Lowell, Mass.; Charles W. Noble of Johnsburg and J. O. Cunningham of Chestertown.

Edgar A. Jones and Louis J. Cherrier have purchased the retail Stove and Tinware business of Hendriek A. Currier, at Franklin, N. H. Mr. Currier has been in business in Franklin since 1879, when he bought out his brother, J. H. Currier. The members of the new firm are well known business men of Franklin, Mr. Jones having been for years bookkeeper at Walter Aiken & Sons' mill, and Mr. Cherrier having been engaged in the plumbing business in that town.

A Grindstone Scorcher.

A new use for bicycles has been discovered. It is to run grindstones with them. John Arrowood, who claims to be the first to transform the wheel into this useful piece of mechanism, tells the *American Blacksmith*, as follows, how it is done:

I had the frame of an old bicycle and used it in connection with the stone. I first cut out the middle brace

A Grindstone Scorcher.

of the bicycle, and with a 2 x 4 timber made the rear support. Next I stapled the front of the bicycle to a stout post and then made the frame of the grindstone. I braced the bicycle frame underneath. By cutting the spokes out of the rear wheels I secured the small sprocket. I then fitted a small piece of wood into the square hole of the grindstone, bored a hole in the wood the size of the sprocket axle and fitted the axle to the stone. I cut notches in a piece of iron for the axle to rest in and nailed the iron to the frame. As the stone was quite high, it was necessary to obtain two chains and put them together. The machine is now a handy ball bearing grindstone, which runs at lightning speed and cost but little to make.

At the annual meeting, on January 23, 1902, of the Engineers' Club of Scranton, Pa., the following officers for the ensuing year were elected: President, H. H. Stoek; vice-president, B. F. La Rue, professor of civil engineering in the International Correspondence Schools; secretary, A. E. Lister; treasurer, F. J. Platt; corresponding secretary, A. B. Dunning; librarian, H. M. Lane, professor of mechanical engineering in the International Correspondence Schools; directors, W. M. Marple, C. C. Rose and H. W. Rowley. President Stoek is the able editor of "Mines and Minerals," the well-known mining publication, issued by the International Textbook Company, Scranton, Pa., proprietors of the International Correspondence Schools.

The City Council of Chicago recently blocked temporarily the construction of eight new skyscrapers, including seven 16-story and one 14-story building, on which the builders expected to expend about $12,000,000. The action of the Council was taken on account of a strong opposition which has sprung up to these high buildings by the inhabitants of other parts of the city, the claim being made that the lofty structures in the business district tend to confine all trade in the downtown part of Chicago to the detriment of other portions of the city.

Analysis No. 72,339. NEW YORK, Dec. 7, 1896.
We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.
The enamel coating is homogeneous, of extra thickness, and great purity.
It is *entirely free from arsenic, lead* and *antimony*—metals so often found in enameled goods.
Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

{ Pierre de P. Ricketts, E.M., Ph.D.
{ John H. Banks, E.M., Ph.D.

Analysis No. 14,180. NEW YORK, May 6, 1897.
LALANCE & GROSJEAN MFG. CO.:
GENTLEMEN—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.
We find this enamel is *absolutely pure and free from Arsenic, Antimony, Lead and other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,
RICKETTS & BANKS,

TINSMITHS HELPER *and* PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop.

An elementary manual for the young tinsmiths A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion **$1.00**

Section 1 ~ Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.
Materials Used in Galvanizing.

Metal Ceilings for Offices.

Berger's Classik Metal Ceilings are just as suitable for Offices as they are for Stores, Churches, Schools, Restaurants, Halls, etc. They are economical, mechanically excellent, and of great artistic beauty.

They can be had in plain or ornamental patterns; can be decorated to harmonize with finish of room and of furniture. They have valuable constructional features which simplify their erection, are easy to keep clean, stand wear and tear; ***STAY UP.***

"BERGER'S Classik METAL CEILINGS"

are High Art ceilings, handsome in design, correct in style and stamped with a clearness which brings out the details in bold relief.

If you have only seen the ordinary run of stamped ceilings, it is more than likely you do not realize how much better and more attractive Berger's Classik Metal Ceilings are.

Write for our handsome Catalogue and full particulars.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

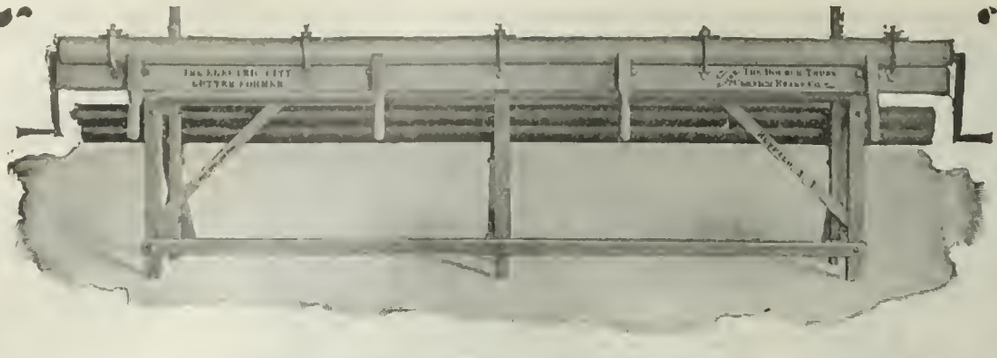
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

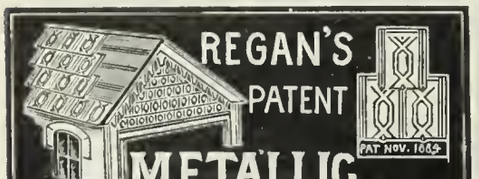
THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims. Ask us about it. We gladly furnish information and price on request.



THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

QUICK MEAL

Wickless Blue Flame Oil Stoves.

"Quick Meal" Blue Flame Oil Stoves are simple, durable and easy to regulate. Their perforated burner drums are stamped out of one piece of heavy steel. Their drip cups are also stamped and drawn out of one piece of heayv brass. These parts being made of one piece makes them strong and durable and leaves no creases for the dirt to gather in.

"Quick Meal" Blue Flame Oil Stoves have only one valve for each burner, which makes them simple and easy for the operator to understand. Their frames are strong and their design attractive. This makes them easy to sell. Catalogues are now ready. If you have not received one write for it.

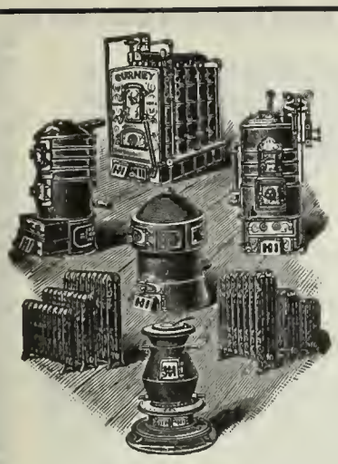
The Leading Line of Heating Apparatus.

HOT WATER,
STEAM,
HOT AIR.

Be Careful, Mr. Contractor

You'd better be a bit careful when you're putting a heating plant into a customer's house. You're helping your reputation, or hurting it, in the easiest place in the world to do either.

If you don't make a good job of it your customer won't forget it.



If you're not sure of the heating apparatus used he'll lay it up to you just the same.

You'd better put in a Warm Air, Steam or Hot Water Heater that there isn't the least question about—one that you know can be depended upon to do the work required of it, that you are sure will wear well, that you are certain will not be causing continual annoyance to its owner—and to you

You may be certain that a MAGEE Heater will never go back on you.

HENRY N. CLARK CO., 56 and 58 UNION ST., Boston, Mass.

THE average manufacturer of Furnaces, when getting out a new Furnace, thinks it necessary to have special talking points; something different from his competitor.

Perhaps, if he works on it long enough and dwells upon the why and wherefore of some complicated flue construction, massive front, artistic ornamentation, he really believes he has the great and only best heater and coal saver that ever was, and wonders why you can't pay him extra dollars for it.

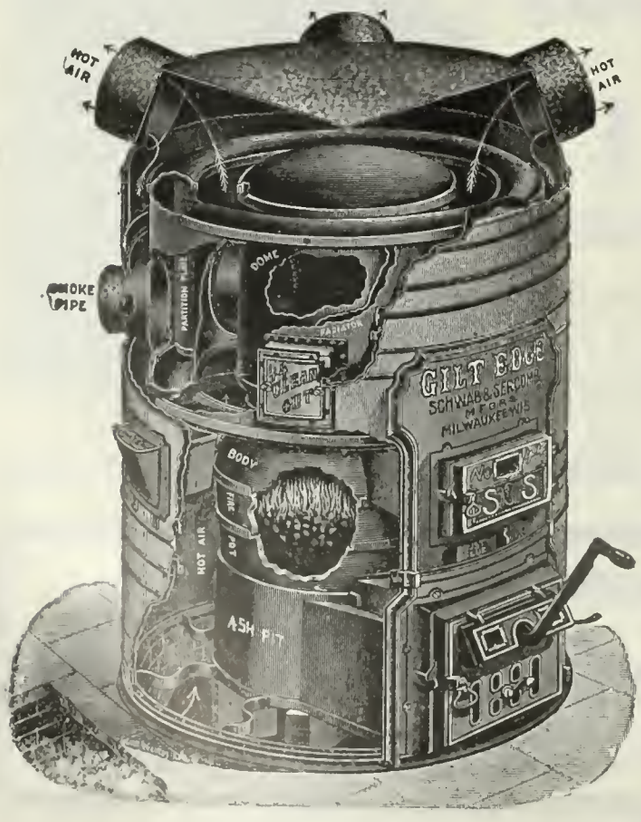
The average dealer has already learned a lot about theory; it's results that count.

Set a *"DIGHTON"* in the next house or same block of houses where there is a chance for fair comparison, ask your customer how many rooms are heated, how much coal was used, how many months he had a fire; if at the end of *one*, two, five or ten years your customer don't think the *"DIGHTON"* the best value of any furnace on the street, let us know about it.

Name, sentiment, theory or ornamentation don't count so much as results.

Compare *"DIGHTON"* results with any other Furnace, no matter what the price of it may be.

DIGHTON FURNACE CO., - - Taunton, Mass.



For a swell job

You ought to know our line—many a dealer loses an opportunity to make a good profit because he knows only heating stoves and furnaces.

We can post you concerning steam and hot water heating, so you can get a share of what is due you.

KEWANEE BOILER COMPANY

The Stanton Seamless Heater,

PORTABLE CASED.

LOUISVILLE, KY., Apl. 5th, 1901.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst. is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly,
ROBINSON-HUGHES & CO.

Martin's Ferry, Ohio.

See our advertisement next week.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

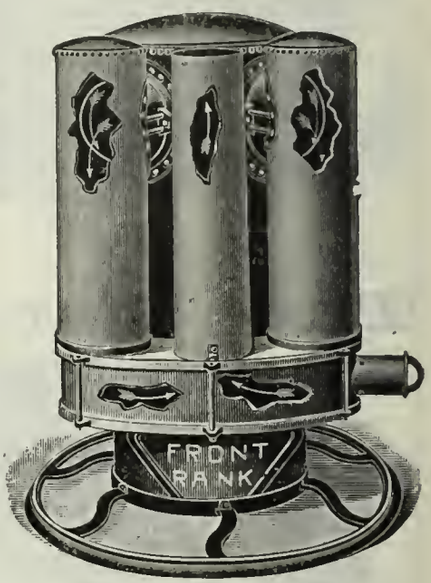
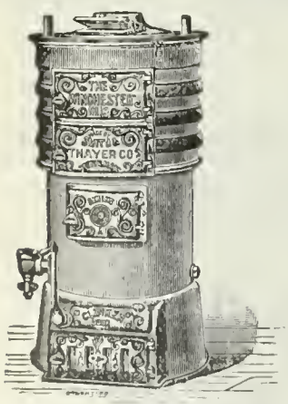
THATCHER FURNACE CO., 240 WATER ST., N. Y.

Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.



The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.



The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

JEWEL GASOLENE STOVES

"Do not last."
"Wear out too quick."

If you do not believe it read the following letter.

W. W. MONTAGUE & CO.,
San Francisco. Los Angeles, New York.

Los Angeles, Feb. 11, 1902.
Messrs. George M. Clark & Co.,
72-76 Lake St., Chicago.

Gentlemen:

We are having some trouble with the JEWEL GASOLENE STOVES; THEY DO NOT LAST; THEY WEAR OUT TOO QUICK. A gentleman who lives in Los Angeles called to-day and got a rubber ring for a Jewel. Says he has used that stove continuously since 1888, and during that time has only had to buy one new generator.

Yours truly,
(Signed) W. W. MONTAGUE & CO.,

Common Sense Circulator AND Radiator.

A FUEL SAVER.

This heater is so simple that its superiority over all others is plain. Being open at each end, the cold air is taken in at the bottom, passing out heated at the top, producing a constant circulation unequaled by any radiator, is easily cleaned out and if necessary can be repaired by any tinner. Takes the place of a joint of pipe 6 or 7 inch, outer casing 10 and 12 inches in diameter. Made of Wood's Refined and American Russia Iron. Can be used on pipe in back of stove, or room above, with any kind of fuel. It is the best heater made. Patronage of Stove and Hardware Jobbers solicited. If the house you buy of cannot supply you send direct to me. I am not looking for Department Store or Mail Order trade. Patent applied for.

Practical Hints on Joint Wiping,

FOR BEGINNERS IN PLUMBING.

SIXTH EDITION, ENLARGED.

With forty-one illustrations; 66 pages. Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

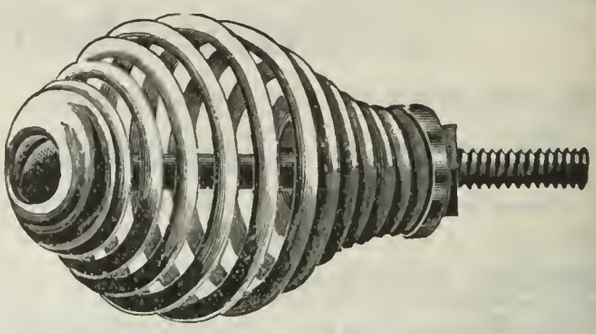
Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.



Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

SENT, POSTPAID, ON RECEIPT OF PRICE, $1.50

Anderson Coupling Co.

PORTLAND, CONN.

Our remarkable recent inventions enable us to offer the public an intensely brilliant, smokeless gas at much less cost than city gas, better, safer, and cheaper than electricity, and costing but one-fourth as much as acetylene. Most durable and least expensive apparatus to maintain in effective perpetual operation. Gives services of lighting, cooking, and heating, and operating pumping engines. Fullest satisfaction guaranteed, and easy terms. The very apparatus for suburban homes, institutions, etc. We construct special apparatus also for fuel gas for manufacturing, producing gas equivalent to city gas at 50 cents per 1,000 cubic feet, and made to respond to very large demands; also for lighting towns, etc. Cooking by gas rescues a person from the intolerable heat experienced with other stoves. *Send for Catalogue.*

The Kelsey Warm Air Generator.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

Acetylene and Electricity.

Many of the recent disastrous fires have, on investigation, been traced to the use of electricity, and the public is not by any means satisfied that the methods of electric illumination and electric motive power have yet been developed to the point of perfection. Yet, great as have been the loss and damage resulting from this cause, there is no doubt that the popularity of electricity for lighting and other purposes will continue. The acetylene people, however, are taking these electrically caused fires as a text for arguments in support of the interests of their form of illumination. They urge that while the bright white light produced by acetylene gas is of itself a strong argument in its favor as a substitute for the yellow and dull red of the incandescent electric light, the element of safety is a far greater inducement. The advocates of acetylene point out that the losses sustained last year by fires directly traceable to electric wiring amounted to over $20,000,000. On the other hand it is claimed that not a single fire loss amounting to $1000 was reported as being caused by the use of acetylene gas, notwithstanding that there are in use over $200,000 worth of acetylene gas generators of more than one hundred different makes and of good, bad and indifferent construction. That there is still room for improvement in the installation of electric systems is acknowledged, and the same is true of the acetylene lighting apparatus and its construction. The plumber and general mechanic, however, is more interested in acetylene lighting, as the field for its use is not confined to cities but is found wherever a fine residence or small village exists. As an individual system for an isolated building requiring, say, one thousand lights, as in the various rooms of a summer hotel and its grounds, the acetylene system has proved acceptable, as well as for lighting the streets of small towns. It is equally well adapted for the small cottage of the suburban resident or the farm house. These features, together with the superior light afforded, have already made the light popular, and it only requires a greater familiarity with it on the part of the public to greatly increase its use. The installation of acetylene apparatus may be readily effected by mechanics engaged in the trades to which our columns are devoted and their attention is commended to a study of acetylene with a view of securing the benefit that may be derived from a more general use of this system of lighting. There are certain principles that have been discovered in connection with the generation and use of acetylene gas that must invariably be observed. These must be learned and impressed upon customers in order to avoid the accidents that were incidental to the early use of lighting plants of this class. Where these principles are thoroughly understood and the apparatus used accordingly, the comparative immunity from fire losses referred to above is likely to be maintained where acetylene gas is used.

Furnace Air Supply.

Laws to compel the change of air, in school buildings in particular, by taking fresh air from out of doors, warming it and then sending it into a building, with provision to exhaust the air previously contained therein, have had a noticeable influence in the East on the method of supplying furnaces with air. It is quite a common custom, and one that is growing, to provide the furnace with a duct connected at the bottom and leading to a point outside of the building, so that the exterior air can readily flow in, to pass over the heated surface of the furnace and be distributed through the building by means of the hot air pipes. The size and location of this air supply duct have remained an unsolved problem to many in the furnace trade, although experienced men favor running it from the most exposed side of the building and providing it with a capacity equal to from two-thirds to three-quarters of the area of the combined hot air outlets from the top of the furnace. Evidently this custom is by no means universally observed, at least in some sections, in the West. The conditions there are somewhat different from those obtaining in the Eastern part of the country. The Western winters are apt to be more severe throughout their entire length, and the period at which the mercury ranges below zero is much longer extended. Consequently the heating of buildings with furnaces is a somewhat more difficult problem in that section. Quite a strong favor is shown to the use of return air ducts in the West. In many instances provision is made to take some air from out of doors, but the damper in this section of the air supply duct is frequently closed as soon as severe weather is experienced and the supply of air for the furnace is taken from the inside of the building. Whatever may be urged against this practice from an advanced sanitary standpoint, the arguments are strongly in its favor from an economic point of view. There is no question but that the building in which the heating is so arranged can not only be more readily warmed and the temperature more evenly maintained, but also with a much smaller consumption of fuel than if the entire air supply was taken from out of doors with the mercury from zero to 20 or 40 degrees below. The fact that this method of using furnaces has been customary for many years also strengthens the position of those who advocate it. When the question of the purity of the atmosphere in such buildings is raised it is pointed out that the buildings are occupied by comparatively few people to vitiate the atmosphere, and that a sufficient change to maintain a satisfactory purity is effected through the natural leakage around the crevices of the windows and the building generally, in addition to the large amount of air that will naturally be admitted through the open-

ing and closing of the doors. In this connection we present elsewhere in this issue an article from a furnaceman who has had a long experience with the return air system of furnace heating, which should prove of special interest to the trade.

Progress of a Century.

Some very striking comparisons, illustrating the changes that have come about in the United States in the course of a century, are presented in the statistical abstract just issued by the Treasury Bureau of Statistics, and which is founded upon the census returns from the years 1800 to 1900. In the first place the remarkable growth of the country is shown in the fact that the gross area of the United States, exclusive of Alaska and Hawaii, grew from 827,844 square miles in 1800 to 3,025,000 square miles in 1900, while the population increased in the same period from 5,308,483 to 75,693,724. That is, the area of the country, exclusive of the territories mentioned, was more than three and one-half times as large and the population fifteen times as great at the end as at the beginning of the nineteenth century. One of the most remarkable contrasts is that of the foreign commerce of the country. In 1800 the imports were valued at $91.000,000 and the exports at $71,000,000, the imports exceeding the exports by $20,000,000. In 1900 the imports were valued at $823,000,000 and the exports at $1,487,000,000, the exports being $664,000,000 in excess of the imports. In other words, while the annual imports grew in value more than nine-fold in the century the exports of the last year of the century were twenty-one times as great as those of the first year. The comparisons as to the wealth of the country are also very impressive. Thus the total deposits in savings banks in 1820—the first time when such statistics were gathered—amounted to only $1,138,576, and the depositors numbered 8635. In the year 1900 the depositors had increased in number to 6,107,083, and the amount of money on deposit to $2,449,547,885. Thus the number of the depositors in savings banks was 700 times as great and the amount of deposits over 2150 times as great at the end of the century as at the beginning. Similar contrasts could be extended to great length, but those above quoted will serve to give some idea of the extraordinary measure of material progress secured by this country in the course of the past century.

Hardware Consolidations.

The subject of consolidation has of late been obtruding itself on the attention of the trade. Speculation is rife in regard to the movement among the jobbers to effect a unifying of their interests. While it is known that negotiations to this end are being continued, those connected with the project have not taken the public into their confidence, notwithstanding certain mysterious intimations that developments may be looked for before long, with possibly the announcement of the successful conclusion of the negotiations in some form. In the manufacturing field more evident progress is being made. The coming together of the axe manufacturers in an agreement which looks toward consolidation of their interests is familiar to the trade, who are thus confronted by a market of even and somewhat confident tone instead of the uncertain and disturbed condition with which they have had to do. This action of the axe manufacturers was in good measure anticipated by those in close touch with trade movements, but the announcement made in this issue of the uniting of the interests of two great companies manufacturing builders' hardware will be received with a sensation of genuine surprise, as the matter was consummated so quietly that very few were aware that negotiations were being conducted to this end. This consolidation will be generally recognized as an eminently wise move on the part of the great corporations whose interests are thus harmonized, and it should do something to induce a better condition of things in the disturbed line of trade to which their products belong. If it should be followed by efforts to eliminate or diminish the confusion which prevails in the selling of builders' hardware and the methods which make it unprofitable to all classes in the trade, it will be a matter for general congratulation.

The following, received this week from our London correspondent, gives added point to the editorial on the subject of insufficient postage printed in our last issue: "American export firms," he remarks, "who are in the habit of sending catalogues and other communications to this country would be well advised to give specific instructions to their office boys as to the proper amount of postage required. Twice a week there comes into this office a batch of catalogues from various American firms, and it is a very rare occasion when I do not have to pay excess postage. This morning I have paid out no less than 90 cents excess postage on these catalogues. If the same sort of thing is happening in private counting houses, I am quite sure that considerable irritation is created. It gives the impression of carelessness. It is one of the little idiosyncrasies of the Englishman that he loves correctness in small matters, and it is just as well to humor him."

PROGRESS WITH PLAN TO AVERT STRIKES IN THE BUILDING TRADES.

In a recent issue we referred at some length to the work which is being done by William H. Sayward, secretary of the National Association of Builders, looking to the establishment of a permanent Court of Settlement and Appeal in connection with the building trades. It is gratifying to be able to record the fact that Mr. Sayward is meeting with consistent encouragement in his efforts to permanently harmonize the interests of employers and workmen in these trades in New York City, although up to the present time his labors have been limited to the presentation of his plan to organizations of employers and to securing their approval. Nearly all the organizations in the metropolis have been addressed on the subject and approval has resulted in every instance.

As soon as the plan has been presented to the remaining employers' organizations, it is Mr. Sayward's intention to pursue the same course with relation to the workmen. He will present the plans to the unions as rapidly as possible, until the whole field is covered and both employers and workmen have become thoroughly familiar with the scheme, its proposed details and the method of operation. No attempt will be made to put the plan into actual operation until the entire field has been thoroughly canvassed and sufficient support has been pledged to secure the success of the undertaking.

A large number of union workmen have been interviewed in an unofficial capacity by Mr. Sayward, and all have expressed themselves to him as heartily in favor of the plan and willing to do all in their power to aid its establishment.

A bill has been introduced into the New Jersey Legislature amending the general incorporation laws of that State, so as to compel New Jersey corporations to furnish to the public more information in regard to their operations. It calls for the publication of practically the information embodied in the recent annual report of the United States Steel Corporation. The measure is said to be strongly backed and to have a good prospect of enactment.

BUYING STOVES EARLY IN THE WEST.

The Western stove manufacturers are finding not only a good seasonable demand for their products, but are further enjoying a large inflow of orders for stoves to be shipped next fall. While this is customary in some special lines of goods, it is not usual for general orders for fall shipments to be placed so early. The conditions now governing the iron trade are of such an extraordinary character that stove dealers believe they are fully warranted in placing orders now, as they may thereby avoid the payment of considerably higher prices. The demand for iron and steel is observed to be running beyond the capacity of the country, although the production at present is in excess of anything before known. While it is appreciated that the leading interests in the iron and steel trades are endeavoring to keep prices down, yet experience teaches that a wave of phenomenal consumption is likely to overcome all efforts to stay such a commercial movement and that unless a great change occurs in the temper of consumers it is exceedingly probable that a considerably higher level of prices may be obtained. Under the circumstances, therefore, it is only prudent for dealers to fortify themselves against such a contingency. It is believed that the only adverse influence now to be feared is a failure of some one of the important crops of the country. Barring this contingency, on which all merchants must take their chances, the year promises to be one of magnificent trade in every respect.

MAKING LONG FURNACE PIPES WORK.

BY I. E. D.

In reading over the last issues of *The Metal Worker* I notice that some of the readers are having trouble with warm air furnaces and long pipes. I have been very successful with warm air heating, but my experience out here in Iowa is only with one and two-story buildings. It is immaterial to me where the furnace is located under the building. All I care for is to have the shortest and straightest possible run for the smoke pipe, which I always see is plenty large enough. I am also particular that the chimney works perfectly before I connect with it. Then I dig a pit under the furnace about 2 feet deep, never less than 2 feet. I then locate the cold air pipes, for which I dig a trench of the same depth as that of the furnace pit. If I have a long run of pipe, such as one of your readers has, I always take a cold air pipe from the same room that the long warm air pipe goes to. Then, in order to make the cold air pipe feed the return warm air pipe, I lay up a partition across the furnace pit and brick it up to the bottom of the furnace so as to have a complete circulation on that side or part of the furnace. The pit must be divided into as many parts as there are cold air pipes and in proportion to the cold air pipes. Where the long run of warm air pipe is connected to the furnace I have the cold air inlet directly underneath the warm air outlet. The cold air return is brought down from the room on the far side as far away from the furnace as possible and is conducted to the pit along under the floor of the basement, so that the basement floor may be cemented over and not interfere with the cold air pipes. I never place dampers in the warm air pipes in the basement, as I am always able to control the heat by closing the registers. I find in heating dwellings that it is not advisable to use cold air from the outside, because, with the opening of doors and the window, I have all the supply air that is needed without any outside dust and cold air.

I have just taken out a hard coal furnace which the owner has condemned as no good. When I first called on him I told him that his furnace was not properly set. He informed me that he had had that furnace "monkeyed with" for four or five years and by as good furnacemen as I was, and that he would not spend another dollar on it. So I sold him a new one, set it according to my ideas, guaranteed the job, and have never been called on to go back since the furnace was set. He is quite satisfied and has paid for his furnace, and all because I gave the furnace all the good cold air it could use. I took the old furnace and sold it to a merchant here who has a larger house than the first owner and he has always used a furnace. When he paid his bill he said that was the best furnace he ever saw and the only one in which all the warm air pipes worked alike.

Too many of the "boys" in setting furnaces have the idea that all the pipes of a furnace should have the same pitch from the furnace. This is wrong, as the pitch or rise in a warm air pipe must be determined by the distance the heat has to travel and the amount of heat that the pipe is required to carry, and every pipe should be put up on this theory.

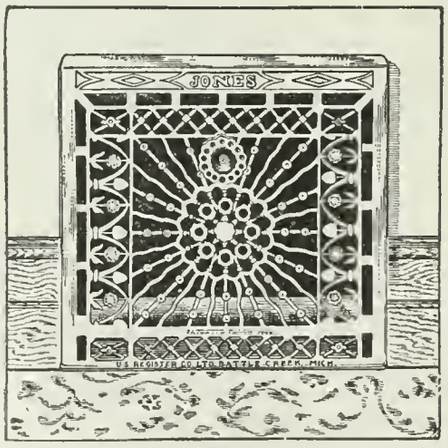
I never use less than 8-inch round pipes and those only to bedrooms and for short runs. I always try to take the cold air from bedrooms or halls into which bedroom doors can be opened, for we spend nearly half of our time in bed, where we need a more perfect circulation than when we are stirring around. I am never bothered with dust in the rooms through the warm air pipes, as I have the cold air pit deep under the furnace and a thin coat of cement all over the bottom and out in the bottom of the cold air inlet. In order to find how much cold air a furnace should have I first find how many warm air registers there are and their capacity, and then make my cold air inlets of the same capacity. I am then sure that the furnace has all the cold air it needs. Never make the cold air pipe smaller than the warm air pipe, for the warm air travels faster than the cold air; therefore it equalizes the flow, although the heated air has expanded.

Acme Gas Appliances.

H. Adler Company, Pittsburgh, Pa., are sending to the trade a very neatly printed and illustrated catalogue and price-list of 16 pages, printed in two colors, relating to the Acme gas ranges, which they manufacture in several varieties. The Acme ranges are shown with handsome exterior, cast ornamentation being largely used in the external decoration. The constructive features are of the latest type, and the fuel may be artificial or natural gas. The sides of the cast ranges are made perfectly plain, but are heavily ribbed at the weak points. The ranges are full asbestos lined, tightly cemented, so that no air whatever can come between the asbestos lining and the iron, therefore avoiding condensation between them, which would rust the oven in a very short time. This feature of construction, the manufacturers claim, can only be successfully used where the parts are perfectly flat, and that is the reason why they do not use an ornamental side. The plain cast side can be made lighter than the ornamented, and the less iron there is in the body of the range the less heat it will absorb and the better the test with the oven for the amount of gas consumed. Extra heavy needle valves are used on all ranges, excepting for artificial gas, where the lever cock is used. The closed top ranges are provided with a flue system, by which each burner has a separate flue for supplying it with fresh air, and also an exit flue for carrying off the burnt gases. The manufacturers state that all the burners in the Acme ranges are constructed and adjusted in such a manner that they will operate perfectly, on the lowest or highest pressure, without the gas catching at the valve orifice on the lowest pressure or burning yellow on the highest pressure, and without changing the valve orifice in any of the valves after the mixer collars have been properly set for the gas on which the range is to be used. The Acme range is made with combination broiler and water heater attachment, as well as plain. The pamphlet also gives attention to what are known as the Acme and Perfect cookers, the Perfect Cooker Junior, the Acme baker, the Improved Acme and Perfect ovens and the Acme hot plates. A telegraphic code is a feature which will be found of interest and value by dealers desiring to order goods by wire.

A FIRE which occurred on the evening of February 17 practically destroyed the plant of the Dauntless Stove & Burner Company at Massillon, Ohio. It is stated that the loss is largely covered by insurance.

SOME SHORTCOMINGS OF FURNACEMEN.



BY G. M.

It has given me pleasure to read some of the articles on furnace setting in *The Metal Worker*, as it indicates that the trade is waking up on some good practical points. Having had 20 years' practical experience in setting furnaces and superintending some high class work I feel at liberty to point out some of the shortcomings of the furnacemen. In some instances they have recommended a class of work merely for the sake of receiving a contract at the hand of the architect or builder, which action, in the end, has been detrimental to the whole trade. Since the manufacturer of furnaces has advanced the portable furnace to take the place of the brick set furnace, furnacemen have followed in the wake and left trailing behind them some work that is not very creditable. From my experience, there is nothing in the portable furnace that will recommend it as a heater. By the force of the same circumstances we have accepted the conditions as they have been found by using rectangular and oval pipes to convey hot air up through partitions, which of itself will not recommend the sale of the furnace for heating buildings.

There is yet another feature of which I wish to speak. The most important thing of all in hot air heating is the cold air supply, and it should be treated as such. I have seen the air box taken from all sides of the building at or below grade; sometimes from the garbage yard, or near the cesspool; which is all wrong. This is a matter which, in my experience, I consider has not had proper care with a view to the health of the occupants of the house and to good results from the furnace. I should like to see, through the agency of *The Metal Worker*, some discussion and arguments as to the first principles, and then we can advance to the practical features.

The Jones Side Wall Register.

A register that is said to materially increase the efficient capacity of hot air flues is presented in the Jones side wall register, patented by A. O. Jones, and made by the United States Register Company, a new corporation recently organized at Battle Creek, Mich., with a capital of $100,000. The officers of the company are L. Moblo, president; G. Redner, vice-president, and A. O. Jones, secretary and treasurer. Boyd Redner and William S. Jennings, with the officers, form the Board of Managers.

The Jones Side Wall Register.—Fig. 1.—General View.

In the accompanying illustrations Fig. 1 gives a general view of the register, from which it can be seen that the face is of a very open pattern, presenting little obstruction to the outflow of the warm air. Where but one room is to be heated, the register sets flush with the base board; where two rooms are to be heated, it projects into the room 1½ inches at the bottom. The register is designed to set in a cast iron collar, and a space between the register proper and the collar allows air to flow in through the outer openings in the face plate, while the space around the hot air flue is made available for ventilating purposes. This is clearly indicated in the sectional illustration, Fig. 2, which also shows a valve for opening and closing the register whereby no obstruction is presented to the passing air, while the supply can be regulated in quantity as desired, and the course of the flow be thrown naturally in the direction desired. The register box included with each register enables it to be set flush with the wall or swung forward at the bottom by means of lugs. The provision of this register box leaves the register ready to be installed and saves the time and material used in making register boxes. The registers are made in a variety of sizes and finishes. In operation they are said to aid the flow of air from the furnace, by avoiding friction and thereby substantially increasing the heating capacity. This register is the subject of a four-page circular, which presents it in a most attractive manner.

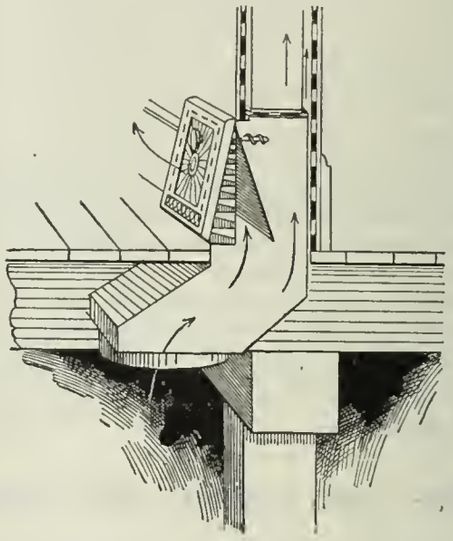


Fig 2.—Sectional View, Showing Valve and Ventilating Feature.

Robinson Furnaces.

The new 64-page catalogue of the Robinson Furnace Company, 107 and 109 Lake street, Chicago, gives full details regarding the line of furnaces which this company now have on the market. These furnaces embody some special features which are original and are fully protected by patent. Prominent among these features are the construction of the Tubular furnace and the hot blast for soft coal. Additions have been made to the original points from time to time, as conditions seemed to demand, and the line is claimed to be up to date in every respect.

The leading place in the catalogue is given to the Robinson Tubular furnace, which is constructed with vertical tubes surrounding the combustion chamber. The air to be heated passes through these tubes, which are directly exposed to the fire, and it thus becomes thoroughly heated by positive action. The Tubular furnace is built with a radiator having cast iron tops and bottoms, and the vertical flues incased in a heavy sheet of refined steel in one piece, or with a radiator wholly made of cast iron with no joints in the top. It is so constructed that it has a full revertible flue to secure the perfect extraction of the heat units from the products of combustion.

The Robinson Hot Blast furnace for soft coal is constructed with a gas ring passing around the upper part of the fire pot. This gas ring has eight sectional linings, which form its inner part and can be replaced through the feed door without dismounting the furnace. The gas ring has numerous holes through which the heated air can be discharged into the fire pot to secure perfect combustion of soft coal to which it is specially adapted. This furnace is also constructed with a radiator having vertical tubes through which the air passes to be heated.

The Reliable line is constructed with steel radiator and sectional fire pot, and is adapted to either hard or soft coal. The dome is extra heavy and large at the bottom and drawn in at the top. The air passes close to the fire pot, then over the bottom of the dome between it

and the radiator, thus getting full benefit of all the heated parts of the furnace. The radiator is made of heavy steel, and so constructed that the products of combustion make a complete circuit before entering the smoke exit.

The Robinson Tubular wood furnace is built for the use of wood exclusively. It has a horizontal fire box made of cast iron, heavily corrugated, with a feed door extra large to admit almost any kind of wood. The radiator is built of heavy steel, with cast iron top and bottom, and is furnished with a number of vertical flues for the passage of the air to be heated.

The Robinson Tubular hot water and warm air heater is a combination furnace, consisting of the tubular furnace fitted with an Eclipse water heater. This is a powerful heater, which will carry from 50 to 700 square feet of direct water radiation according to the size.

The Eclipse combination grate is a construction specially designed for the use of either gas or coal, and is supplied with all Tubular furnaces, if desired. With a grate of this kind gas can be used for ordinary winter weather, and if the supply of gas is weak coal can be used to add to the heat in extreme weather.

An illustration is given of a cast iron smoke box with a damper which is used on all Robinson Tubular furnaces. This smoke box is placed between the furnace and the smoke pipe. When the damper is drawn back the smoke enters the pipe directly, but when it is closed the smoke divides at the rear and makes two complete circuits of the radiator around the flues before entering the exit. This smoke box is also furnished with a check draft, to be connected by chains to the chain plate in an upper room.

The catalogue further contains illustrations of furnace fittings, instructions for setting furnaces and numerous testimonials from those who are using the Robinson line.

WHAT SHOULD A FURNACEMAN KNOW?

BY O. N. E.

We look upon this subject as entirely too large to give even a synopsis of it in one article, so we will be content at this time to confine ourselves to the cold air duct, and possibly we may at some future time work backward from that to the furnace.

Now we often hear that the air box should be of ample size, but to many of us that word ample has a varied meaning. So let us see if by the use of a little reasoning we may not be able to arrive at the proper meaning of the word in this connection. As a basis for this calculation let us suppose the outside temperature to be zero and the air escaping at the register to be 140 degrees above zero. Now we find that 1 pound of air at zero occupies a space of about 11½ cubic feet, and at 140 degrees above about 15 cubic feet, or an expansion of about one-third. So that at zero we would say that a cold air duct of two-thirds the area of all the warm air pipes would be the proper size.

But then we must remember that we do not at all times have zero weather; so to provide for warmer weather we would advise that the cold air duct should never be made less than three-fourths the combined area of all the warm air pipes. Again, we must remember that the duct must be built smooth, as we have made no allowance for loss through friction, and there must be no contractions that will reduce the size of the duct at any point below the dimensions figured on.

Now let us see that the inlet to this duct is in some good position—not near some dirty slop sink, or other damp, foul smelling place. We must also have the duct made perfectly tight if we would have good, pure air, free from dust. We would place a nice, smooth working damper in the duct, so that it may be partly closed off in case of strong winds blowing into the mouth or in case some of the registers are closed. In this instance, of course, we should not need such a large volume of air.

Now that we have provided for an ample cold air supply we must, if we wish a good job, provide some means for the exit of the cold air from the rooms above. This can be easily and cheaply done by the use of ventilating faces placed in the base boards of each room in which we have a warm air register. We have found a face 6 x 15 inches a very good size for this purpose, and it can be placed so as to take up the space between the studding. We have a ventilating flue already made for us to the garret, only we must be careful not to place the faces in the same line of studding. This will provide an easy outlet for the cold and vitiated air to the attic, when, as a rule, it will easily find its way from there to the outer atmosphere.

Common Sense Heat Circulator and Radiator.

A new drum or radiator, which is herewith illustrated, is being manufactured by the inventor, A. C. Selleck, 755 and 757 West Madison street, Chicago. It is named the Common Sense heat circulator and radiator, and is offered to the trade as a device representing the thorough utilization of natural laws in securing the additional heat to be obtained from the application of the principle of the well-known drum. Fig. 1 is an exterior view of the radiator, and Fig. 2 exhibits it with a portion of the casing removed to show the interior construction. This drum is of such length that it is only necessary to

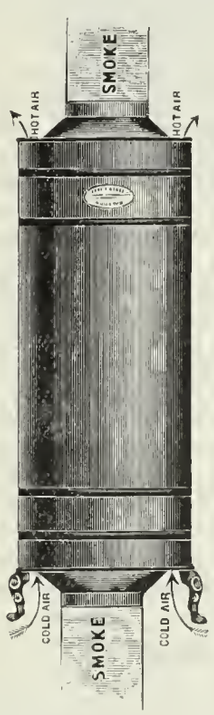

Fig. 1.—Exterior View.

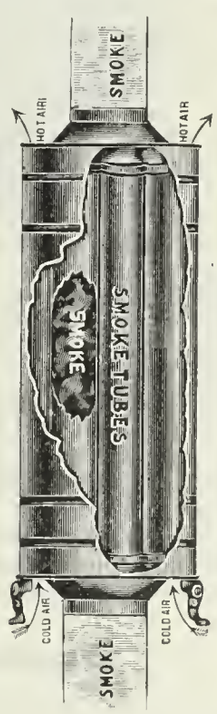

Fig. 2.—Broken View.

Common Sense Heat Circulator and Radiator.

remove one joint of pipe. It is constructed so that the smoke is divided and passes through a number of vertical tubes, thus securing a very large radiating surface against which the air comes in contact, being admitted at the bottom of the drum and expelled at the top. The difference between this actual construction and that described by an error in our last issue will be readily seen. The arrangement provides a number of passages between the tubes and the casing, through which the air to be heated is drawn. It is claimed that this construction secures a constant circulation of heated air in the room, which equalizes the temperature. This heater, being open at both ends and having vertical passages for the air, undoubtedly secures vastly better results than a construction having horizontal passages. It is as easily cleaned as a joint of pipe and does not affect the draft. It is made of Wood's refined and American Russia sheet iron and is very neat in appearance. While this is a superior article in every respect, it is sold at a very moderate price.

The Art Stove Company, Detroit, Mich., have in process of construction a large power house, in which when completed they will install new engines, boilers, blowers, &c. The addition has been rendered necessary by their largely increased business.

The Pittsburgh Stove & Range Company.

The Pittsburgh Stove & Range Company of Pittsburgh, with main offices in Allegheny, Pa., purchased some time ago 23 acres of land in Beaver, Pa., near the Pittsburgh & Lake Erie Railroad and will extend the manufacturing operations at that place. The concern have been negotiating for some time with the Board of Trade of Beaver Falls, Pa., with a view of locating in that district. Satisfactory arrangements have been made between the two parties, and the Board of Trade have given bond to the amount of $100,000 for the faithful performance of their contract. Among the terms of the latter is the agreement that the Board of Trade shall sell, at $300 each, 250 building lots embraced in the land acquired by the company.

Plans for the new plant are being prepared by a Pittsburgh engineer, but have not yet been completed. The number of buildings and their size are still to be decided upon. But on the whole the plant will cost in the neighborhood of $300,000. Work on the construction of the buildings is to be started as early in the spring as possible. The new industry will employ from 800 to 1000 men. The output of the centralized plants will be the same as that of the plants abandoned—gas ranges, furnaces, cooking stoves, gas and coal stoves and ornamental grates for coal and gas.

The nine stove manufacturing plants to be abandoned by the Pittsburgh Stove & Range Company are the original ones absorbed when the combine was organized. These include five in Allegheny—the plant of Anshutz, Bradberry & Co., on Preble avenue; that of De Haven & Co., Preble avenue; that of Crea, Graham & Co., Rebecca street; that of Bissell & Co., Darrah and Robinson streets, and that of F. & L. Zoegtly, Preble avenue. The other plants to be abandoned are those of Graff & Co., Monongahela; Walters, Walker & Co., Sharpsburg; Baldwin & Graham, New Castle, and A. Bradley & Co., Wood street, Pittsburgh.

Each of these nine plants is to be dismantled. The work now done by them is to be transferred to the big plant at Beaver Falls. Some of the machinery in the plants to be abandoned will be taken to the new works, but most of it will be sold. The properties will be placed upon the open market for sale. In short, these nine industries will soon cease to have any existence. The combined works now employ possibly 800 men.

Enameled Steel Ranges.

The St. Louis Enameling Company of St. Louis, Mo., are a reorganization of the Artistic Enameling Works, the pioneers in the manufacture of enameled steel ranges well known under the name Artistic. New and ample capital has been secured, and the plant, at the old location at the corner of Ninth and Monroe streets, St. Louis, has been overhauled and several new and improved machines have been added to the equipment, enabling the company to largely increase their productive capacity. In addition to ranges they make a complete line of enameled signs and do general enameling work on steel specialties. A revised price-list and catalogue is on the press, and in about 60 days a large and complete general catalogue of their entire line is to be ready for distribution. It is stated that all demands for immediate shipment can now be complied with. The company will be glad to send their catalogue to all interested parties.

The Peninsular Stove Company, Detroit, Mich., are making preparations to increase their facilities by the erection of a six-story addition on Fort street, west, between Eighth and Tenth streets. The plans, which have been drawn by Architects John Scott & Co., call for a structure with a frontage of 200 feet on Fort street and a depth of 50 feet. There will be a basement under the entire building, and a brick subway will connect it with the present foundry on River street. While the structure will be largely used for the storage of finished goods, it will also contain several offices. The contracts for the steel and iron work, the carpentry and the mason work have already been awarded.

ODD PLATES.

Frank G. Gardner, who for many years has been connected with the Chicago house of the Michigan Stove Company, in their advertising department, has been transferred to the home office, and has therefore removed his residence to Detroit.

The Dauntless Mfg. Company recently held their annual stockholders' meeting at Beaver Dam, Wis., and voted to change the name of their corporation to the Malleable Iron Range Company. They also decided to increase their capital stock from $65,000 to $100,000. The officers elected for the current year are as follows: President, J. W. Miller; vice-president and general manager, Silas McClure; secretary, Peter Beule; treasurer, John C. Zander; superintendent, A. C. Terrell.

Prior to his departure last week for China, to take up a lucrative business position in that country, W. P. Millar, who for the past three years has had the management of the Stove and Furnace department of the James Smart Mfg. Company, Limited, of Brockville, Ont., was the recipient of a gratifying testimonial of the esteem of his fellow employees, in the shape of a handsome cabinet of silver ware, together with a complimentary address containing expressions of their regret at his departure and good wishes for success in his new sphere of labor.

The new addition now being made to the Abram Cox Stove Company's plant at Lansdale, Pa., was damaged by a recent storm to the extent of $600. The 32-ton cupola has been put in place, and the new building is progressing rapidly.

The Michigan Stove Company have improved their line of Fireside-Garlands by the addition of an entire cast iron plate in the front; the improvement of the back linings for the purpose of protecting the entire sheet iron body, and the addition of a smoke guard to prevent the smoke from coming out when the feed door is open. These improvements have necessitated a change in the prices upon this line of Stoves. The company have therefore issued a new list of prices to take the place of the former list. They state that this improvement makes the Fireside-Garland one of the most serviceable Stoves of this class on the market. Last year they were unable to supply the demand for this line, but they are now prepared to manufacture them in large quantities.

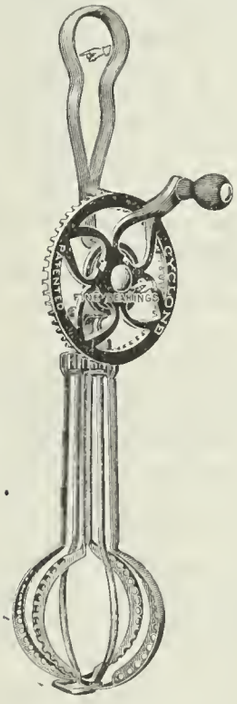
George M. Clark & Co., Chicago, are favoring the trade with a match book, consisting of a number of paper matches conveniently arranged in a cover bearing the company's trade-mark, a picture of a Jewel Gas Range and other references to their well-known line. Each match also has its own reference to the Stoves.

A. W. Glessner, president of the Excelsior Steel Furnace Company, Chicago, Ill., was elected president of the Inland Press Association at the meeting of that body in Chicago last week. He is also a member of the Associated Press. Mr. Glessner called at *The Metal Worker* office this week while in New York attending the banquet given to Prince Henry of Prussia.

The Ohio Stove Pipe & Mfg. Company, New Philadelphia, Ohio, are sending out a pamphlet illustrating and describing their Nested Stove Pipe, which in putting together requires no tools or hammering down of the seams. In addition the company manufacture Four-Piece Elbows and Adjustable Thimbles.

An instructive suggestion of the progress of a half century in the science of Stove construction was given recently by Murray & Dugdale of Haverhill, Mass. They exhibited in their windows a Stove cast at South Newmarket, N. H., in 1852, and with it a Sunshine Oak cast in 1902. The former is small and antiquated, but the proprietors assure us that it is just as ready to work, if necessary, as in 1852.

The Gurney-Tilden Stove Mfg. Company, Hamilton, Ont., have recently established an agency for their goods in Vancouver, B. C., which will be under the charge of a man thoroughly familiar with local conditions. John H. Tilden, the head of the concern, recently made a trip to Vancouver for the purpose of completing the necessary arrangements.



At a recent meeting of the stockholders of the South Pittsburg Stove Works, held in South Pittsburg, Tenn., it was decided to sell the plant, machinery and stock on February 20. The plant was located in South Pittsburg about 14 years ago, and is said to have cost to erect and equip between $250,000 and $300,000, and to have a capacity of something like 40,000 Stoves per annum. The works are in good running order and can be started on short notice.

At a recent meeting of the stockholders of the Parrot Stove Company, Carthage, Mo., it was decided to sell one-half of the stock to C. E. Weeks of the Weeks Hardware Company of Carterville, and to lease the other half to him, on the payment of certain royalties, for two years. It appears that the question has been under consideration for some time, and now that it has been decided in his favor by a majority representing over two-thirds of the stock Mr. Weeks will, as soon as possible, take charge of the plant and put the goods on the market. The castings and steel used in the construction of the Stoves will, it is said, be purchased of a foundry in Gerard, Kan. It is intimated that Mr. Weeks may possibly resign his position as manager of the hardware company and move to Carthage, in order to be better able to look after his interests in that place.

The Odin Stove Mfg. Company of Erie, Pa., have just issued from the press their price-list for 1902, relating to Gas Ranges, Hot Plates, Water and Tailors' Iron Gas Heaters, together with other gas appliances which they manufacture. It is an interesting publication of 24 pages, profusely illustrated with leading lines, including the Eric Gas Range, offered in several sizes; the Eric, Odin and Viking Hot Plates, ranging from one to four burners; the Eric Gas Ovens and Tri-Odin Three and Four Way Burners.

The Cyclone Egg Beater.

William G. Browne, Kingston, N. Y., is offering the trade the egg beater shown herewith. The perforations in the wings are referred to as the most prominent feature of the beater, as it is explained that by them the egg is caught, held and thrown from one flange to the other, and in passing through the perforations is quickly and thoroughly beaten. Among other points of excellence the following are mentioned: That the handle fits the hand; that the bearings are long and the holes are all drilled; that both the blades an dthe shanks are flanged, making them rigid; that the crank handle is of good size and that the foot at the bottom helps to steady the beater when in use. The manufacturer states that it is an excellent cream whip, and is strong enough to beat cake.

The Cyclone Egg Beater.

Rippley's Whitewash and Painting Machine.

The Rippley Hardware Company, Grafton, Ill., are offering the trade the whitewash and painting machine shown in the accompanying illustration. It has an agitator to keep the solution mixed that works at each stroke of the pump. The top of the can is removable, so that it can be easily cleaned. The body is made of No. 24 galvanized steel, and is fitted with a ball valve brass cylinder pump, which, it is explained, will produce a high pressure. It is pointed out that it is not a compressed air machine. When not in use as a whitewashing machine it can be used, it is stated, for spraying trees, gardens, washing windows, buggies, &c.

Rippley's Whitewash and Painting Machine.

Pennsylvania Retail Hardware Dealers' Association.

J. F. Frye, Charleroi, Pa., secretary of the Pennsylvania Retail Hardware Dealers' Association, announces that a meeting of this association will be held March 26 at the Monongahela House, Pittsburgh. It was originally intended to hold this meeting early in February, but the date was put back so as to give the Committee on Programme more time to arrange its work. This is a recently formed association, and the initial stages of the work have been rather difficult, as the members are more or less strangers. There is now good ground for the hope that the programme will be a very useful and entertaining one, with representative merchants taking conspicuous parts.

Enterprise in Marketing Novelties.

Various expedients are resorted to by enterprising manufacturers, who, having evolved a good article in which they have confidence, seek to get it before the buyers or general public in the most effective and expeditious way, even at the cost of considerable effort and expense. Such an undertaking was begun a few months ago by a Pennsylvania manufacturing company, whose specialty is household and kitchen novelties and labor saving utensils, many of which have been shown in these columns. After discarding several plans as ineffective, they decided to send, with their compliments and express charges prepaid, one of their latest novelties, a cherry stoner, to the buyers in concerns handling such classes of goods at their home addresses, together with a sealed can of cherries with which to make at once a practical test in the presence of the housekeeper or cook, although the article works even better with fresh fruit. A large number of these were sent out in the United States, but the intention is to exploit it in the same way abroad where such fruit is raised.

INDIANA RETAIL HARDWARE DEALERS' ASSOCIATION.

The meeting of the Indiana Retail Hardware Dealers' Association, held last week in Indianapolis, was in all respects a most successful convention and thoroughly representative of the retail hardware interests. There was a large attendance of the membership, to which many accessions were made during the meeting. The programme was an admirable one, carefully prepared and carried out with unflagging interest to the close. The counsels of the association were directed largely to the correction of trade abuses, and many valuable suggestions were received by the members.

At the opening session, on Wednesday morning, February 19, Mayor Bookwalter of Indianapolis welcomed the delegates in a graceful address, which was ably responded to by President W. P. Lewis.

The president appointed the following committees:

COMMITTEE ON PRESS: E. C. Minus, Hammond; Mr. Price, Marion; H. J. Trueblood, Washington.

COMMITTEE ON RESOLUTIONS: E. E. Schenk, Mt. Vernon; W. L. Hubbard, Scottsburg; F. M. Smith, Ft. Wayne; W. A. Shipley, Lafayette.

COMMITTEE ON NOMINATIONS: Chas. F. Boonshot, Petersburg; A. W. Smith, New Pass; T. M. Layne, Cloverdale; Chas. B. Frame, North Manchester.

AUDITING COMMITTEE: N. R. Stoner, Rochester; M. Meyer, Jr., Covington; M. P. McDaniels, Winchester.

A. H. Burkett of Goshen was appointed sergeant-at-arms.

At the afternoon session, President Lewis delivered his annual address, and at the close of the address I. A. Sibley, chairman of the Executive Committee, presented him on the part of the members with a handsome gavel, accompanying the presentation with words of hearty appreciation of the valuable services rendered by Mr. Lewis to the association.

Several interesting and able papers were presented and discussed, among which was one on "Window Display and the Art of Selling," by H. W. Beagle of the Robeson Cutlery Company, Rochester, N. Y., and one on "Hardware Store Arrangement," by J. D. Warren of Chicago. H. P. Townley of Terre Haute discussed "Up to Date Hardware Advertising."

On Thursday morning the proceedings were of an executive character, and during them attention was given to many matters of a somewhat confidential nature, relating to the work of the association. Subsequently the report of Secretary M. L. Corey of Argos was presented.

One of the subjects which demanded special attention was the competition of catalogue houses. Other forms of competition to which the hardware trade are subjected were also considered by William R. Powell of Converse, who spoke on "Illegitimate Competition." The treasurer's report showed the treasury of the association to be in a flourishing condition.

The Question Box was then opened, and a number of trade questions discussed at greater or less length. Among these were the following:

Should Stove dealers furnish repairs for Stoves purchased from catalogue houses?

Cries of No, No.

Why should not manufacturers confine themselves to 6 or 7 inch Stove Pipe Collars?

Mr. Sibley offered a motion to the effect that all the manufacturers of stoves are requested to make their stove collars to fit either 6 or 7 inch standard pipe. The motion was seconded, and unanimously carried.

What percentage does it cost you to do business?

One member stated that it cost him 10¼ per cent., another estimated that it cost him 10 to 15 per cent., another 11 per cent., including salary to the proprietor. A member said that figuring salaries and all expenses, including interest on the investment, he calculated it cost 16 1-10 per cent., and the losses from bad debts were one-quarter of 1 per cent.

Mr. Layne, for the Nominating Committee, reported that they had decided to recommend the re-election of the officers who had served so efficiently during the past year, and on motion they were unanimously chosen, as follows:

PRESIDENT, W. P. Lewis, New Albany.
VICE-PRESIDENT, James L. Fulton, Portland.
SECRETARY-TREASURER, M. L. Corey, Argos.

President Lewis, in a graceful speech, expressed his appreciation of the compliment paid him in re-electing him to office.

The Nominating Committee reported the selection of James Fulton and Howard Burkett as delegates to the national convention at Chicago, and Messrs. Jones of Richmond and Bush of Evansville were selected as alternates.

On the call of President Lewis R. R. Williams, hardware editor of *The Iron Age*, then addressed the convention in regard to trade conditions and association work.

Among the features of the convention was a smoker arranged by the merchants and manufacturers of Indianapolis, which was held on Wednesday afternoon, and which proved a most enjoyable occasion.

MISSOURI RETAIL STOVE AND HARDWARE DEALERS' ASSOCIATION.

The fourth annual meeting of the Missouri Retail Stove and Hardware Dealers' Association was held at the rooms of the Mercantile Club, St. Louis, on Tuesday and Wednesday, February 18 and 19. The convention was opened with an address of welcome by President B. F. Naylor of Marshall, who then proceeded to deliver his annual address, in which he briefly and gracefully gave the conditions as they exist in the organization.

Following the president Secretary Frederick Neudorff of St. Joseph presented his annual report. Mr. Best of Palmyra made a motion to appoint a committee to amend by-laws, and it was carried. The chair named as the committee Messrs. Best, Poland and Kansteiner.

At the afternoon session, on Tuesday, a paper on the "Evolution of the Hardware Business, 1850 to 1901," by William Kansteiner of Hannibal, was read by F. A. Kansteiner of St. Louis. Co-operative insurance and other interesting topics were discussed, and an address was given by R. W. Shapleigh of St. Louis, ex-president of the National Hardware Association.

At the Wednesday morning session a number of amendments to the constitution and by-laws of the association were reported by J. W. Poland of Carrollton, chairman of the Committee on Revision, and were adopted by the convention.

The election of officers and committees for the ensuing year resulted in the choice of the following persons:

PRESIDENT, Taylor Frier, Louisiana.
VICE-PRESIDENT, Edw. L. Wachter, St. Louis.
SECRETARY, Fred'k Neudorff, St. Joseph.
EXECUTIVE COMMITTEE: J. W. Poland, Carrollton; F. A. Kansteiner, St. Louis; Frank H. Mayer, Macon.
COMMITTEE ON TRADE ABUSE: B. F. Naylor, Marshall; M. A. Welgart, Kansas City; R. H. Myers, St. Louis.
AUDITING COMMITTEE: M. C. Post, Brookfield; W. T. Shoop, Richmond; Louis Boehl, St. Louis.

In accepting the office of president Mr. Frier expressed appreciation of the honor conferred and pledged hearty and loyal work in the interest and affairs of the association. It was decided to hold the next annual meeting also at St. Louis.

The St. Louis committee having in charge the arrangements for the entertainment of the visiting delegates comprised the following gentlemen: Louis Boehl, A. H. Gruendler, A. F. Geschwinder, F. A. Kansteiner, R. H. Myers, G. A. Pauley, Frank Salomo, August Steinmeyer, E. L. Wachter, Theo. C. Wirtz, who discharged their duties in a most efficient manner. On Tuesday evening a banquet was tendered to the association, which was much enjoyed.

The Buck's Stove & Range Company, St. Louis, through their representative, F. A. Spielman, on Wednesday evening tendered a theater party to some of the members. Those who enjoyed the hospitality of the company were Taylor Frier, John Best, J. M. Kenyon, B. F. Naylor, J. W. Poland, M. C. Post and W. T. Shoop.

The Charter Oak Stove Company, St. Louis, distributed a neat and useful souvenir paper cutter.

Among the representatives of manufacturers, jobbers and others present at the convention were the following:

E. C. Kempfer, Wheeling Corrugating Company, St. Louis.
George R. Barclay, E. H. Simmons, J. S. Payne, Simmons Hardware Company, St. Louis.
H. G. Koenig, Peninsular Stove Company, Detroit.
T. L. Watson, Schneider & Trenkamp Company, Cleveland, Ohio.
F. C. Shays, American Sheet Steel Company, St. Louis.
J. G. Beegle, Rochester Stamping Company and Robeson Cutlery Company, Rochester, N. Y.
C. H. Bishop, T. J. Nonne, C. Sidney Shepard & Co., Chicago.
G. W. Dana, George A. Fry, J. W. Jacobs, F. P. Haus, Charter Oak Stove & Range Company, St. Louis.
S. Y. Buckman, Henry Seagur, F. L. Sweeney, Berger Mfg. Company, St. Louis.
C. L. Hayden, W. H. Sawyer, Estate of P. D. Beckwith, Dowagiac, Mich.
W. A. Lockwood, Ringen Stove Company, St. Louis.
Edward J. Fox, Karl W. Pfeffer, Ralph Buck, Henry Hoerner, Bridge & Beach Mfg. Company, St. Louis.
F. A. Spielman, Buck's Stove & Range Company, St. Louis.
G. W. Simons, Hibbard, Spencer, Bartlett & Co., Chicago.
James T. Newell, *The Iron Age* and *The Metal Worker*, St. Louis.

NORTH DAKOTA RETAIL HARDWARE ASSOCIATION.

The fifth annual meeting of the North Dakota Retail Hardware Association was held in the Loyal Knights' Temple, Fargo, on February 19 and 20. The attendance was the largest in the history of the association and the meeting was profitable to all concerned. In addition to the members there were present representatives from many of the jobbing houses in the West and a number of manufacturing firms.

The meeting was called to order on Wednesday morning by President Helgesen and was addressed in a speech of welcome by Mayor Johnson of Fargo. After a reply by President Helgesen the following committees were appointed:

TRANSPORTATION: H. Harrington, Fargo; H. F. Emery, Fargo; C. N. Barnes, Grand Forks.
NOMINATIONS: H. F. Strehlow, Casselton; I. L. Newgard, Grafton; W. R. McIntosh, Bottineau.
RESOLUTIONS: H. S. Diesem, La Moure; H. N. Joy, Hamilton; C. A. Heegard, Mandan.
QUESTION BOX: H. B. Allen, Jamestown; H. H. Walters, Casselton; O. A. Gallup, Edgeley.

At the afternoon session H. P. Allen of Jamestown read an entertaining and instructive paper on "Fakes and Fakirs, or Leg Pulling," which was followed by a general discussion. H. F. Emery of Fargo then read an interesting paper on "Some of the Difficulties Which Hardware Dealers Have to Contend With."

At the morning session on Thursday President Helgesen read his annual address, which was an exceptionally able and interesting document. C. N. Barnes followed with his annual report as secretary.

At the evening session the following officers were chosen for the ensuing year:

PRESIDENT, H. N. Joy, Hamilton.
VICE-PRESIDENT, H. F. Emery, Fargo.
TREASURER, W. H. Pinkerton, Lakota.
SECRETARY, C. N. Barnes, Grand Forks.
EXECUTIVE COMMITTEE: Anton Enger, Cooperstown; Frank Lish, Dickinson; H. F. Strehlow, Casselton; I. L. Newgard, Grafton; H. Harrington, Fargo; W. W. Jamieson, Wahpeton.

The following delegates to the annual meeting of the National Retail Hardware Dealers' Association were chosen: H. N. Joy, Hamilton; H. T. Helgesen, Milton; C. N. Barnes, Grand Forks.

Papers were read on "One Way to Compete with Supply Houses," by O. A. Gallup, Edgeley; "Dealers' Associations, Their Effect and What They May Accomplish," by Jas. McPhail, Langdon, and "The Practical Hardwareman," by L. B. Hanson, Sheldon. Grand Forks was selected as the next place in which the next annual convention should be held.

Just prior to the final adjournment the convention, by a rising vote, put itself on record as greatly appreciating the valuable services rendered by retiring President H. T. Helgesen, who has so ably and efficiently conducted the affairs of the association during the past two years.

Letters From the Trade.

Defective Goods.

The following communication from a New York house touches on a question concerning which they desire suggestions from the trade:

Kindly present this question in the columns of *The Metal Worker* to decide an argument, viz.:

A dealer bought a combination plier, which was not warranted. He made a sale of it to a customer who tried it in his presence and it snapped in two while handling it. The dealer gave the customer another plier in place of it, and later on called upon the house he had bought it of to replace same, and they refused upon the ground that the article was not warranted. The dealer claims, notwithstanding the fact that the article was not warranted, that no matter how cheap the article is it is meant to be used a few times for the purpose for which it is intended, and when at the first attempt to make use of the article it breaks, that it is not even up to the standard of an unwarranted article, and should be replaced by the wholesaler. The wholesaler claims that when a buyer purchases a tool without any warranty he is supposed to assume all risks, and therefore declines to replace the article in dispute.

Keeping Track of Unfilled or Partly Filled Orders on Manufacturers.

We are in receipt of the following inquiry in regard to a good system in connection with the buying department for keeping track of all orders still unfilled or only partly filled. This is a matter of a good deal of general interest and we hope that the appeal of our correspondents will call out a liberal response from houses whose methods in this regard are satisfactory:

We are looking for a good method of ordering—some system whereby we could keep good track of all orders still unfilled or only partly filled. At present we are using the carbon sheet system, but these are handled so much that they go to pieces on the file, more especially in the last few years, when it has been so hard to get goods. Another objection to this is that in a large business these files are apt to get so bulky before they can be removed.

We will be very much pleased if you will take this up with some of your larger subscribers and let us have the information at your convenience.

Suggestions in Regard to Invoices.

The following communication is from a wholesale house in Pennsylvania, and suggests a change which, in their judgment, should be made in the location of the date of invoices:

We beg to offer a suggestion to the readers of *The Metal Worker*, and think it is entitled to consideration. It is that the date on an invoice head be so arranged that it will not be located at the top of the invoice. A great many dealers use the Shannon style of letter file, and the perforations invariably come where the date is, very often cutting out the day of the month, or the month itself when a figure representing the month is used.

Another thing: There should be a space on the invoice to enter customer's order number, as many dealers are now using number system of orders.

If you feel disposed to have this matter considered in your publication we shall be pleased.

Selling Goods on Installments.

A retail hardware house in Central New York send us a copy of a bill that has been introduced in the New York State Assembly providing for the licensing of dealers who sell goods on the installment plan, accompanied by the following comments:

It would seem to us that this bill, if made a law, would work great hardship on the many legitimate

stove, tinware, hardware and house furnishing goods dealers who sell goods on installments. This plan of selling goods is also a great help to the poor, who are enabled to furnish their homes by small payments. No doubt many of your readers would oppose such a measure, and, therefore, we would ask you to bring it to their notice.

The Stearns Adjustable Lawn Sprinkler No. 2.

E. C. Stearns & Co., Syracuse, N. Y., are offering the lawn sprinkler shown herewith. The quantity of the spray may be gauged by turning the adjustable cap on the screw. Sufficient tension to hold the cap firmly on the screw, it is shown, is furnished by a coiled spring, which at all times exerts an upward pressure against the bottom of the cap. The standard for holding the sprinkler upright in the ground is made of wire, pointed at the lower end, and cast into the body of the sprinkler, which is threaded to fit a standard ¾-inch hose connection, and is provided with an internal rubber packing. All visible parts of the sprinkler are finished in black enamel except the adjustable cap, which is of brightly polished non-rusting metal. It is explained that the lawn sprinkler is intended to meet the demand for an inexpensive sprinkler which will allow the water passing through it to cover a wide area of ground.

The Stearns Adjustable Lawn Sprinkler No. 2.

Gem Food Chopper, Butter Grinding Nut.

Sargent & Co., New Haven, Conn., and 149-153 Leonard street, New York, have added an extra cutter to the group of four steel cutters sent out with the Gem food chopper, which is designed to grind nuts of various kinds to the consistency of a butter. The other cutters of this chopper have apertures in the plates to regulate the degree of cutting—either coarse, medium, fine or pulverized—but, as will be seen by reference to the illustration herewith, there is no outlet in the No. 5 cutter other than at the periphery of the grinder, thus producing a smooth, pastelike mass, necessary in grinding of this character. This steel cutter, known as No. 5, is sent with either the No. 20 or No. 22 Gem food chopper, at no additional cost, and is particularly suitable for making peanut butter or grinding almonds or other nuts.

Nut Butter Cutter for Gem Food Chopper.

Rollman Food Chopper.

The Rollman Mfg. Company, Mount Joy, Pa., have just put on the market the Rollman food chopper No. 11, here illustrated. This machine is tinned, has steel cutters for fine and coarse cutting together with a nut butter cutter for producing a smooth paste like mass desirable in grinding peanuts, almonds, &c. It has a capacity of ½ pound of raw or cooked meat per minute, and is especially recommended by the manufacturers for chopping nuts of various kinds. The machine is practically in two parts. One movement releases the clamp, thus throwing the hopper wide open; the worm screw, handle and disks are likewise practically in one piece, with the other half of the shell completing the chopper, making it easy to get at and quickly cleansed. The company also have in course of preparation two larger sizes, which will soon be ready for the market, their capacity being respectively 1 and 2 pounds of meat per minute, and constructed on similar lines. The latter choppers will have a suitable groove underneath the split in the hopper to catch all the juices and lead them into the dish which catches the chopped meat, vegetables or fruit. The No. 11 size weighs but 18 ounces, and is designed to retail at 50 cents.

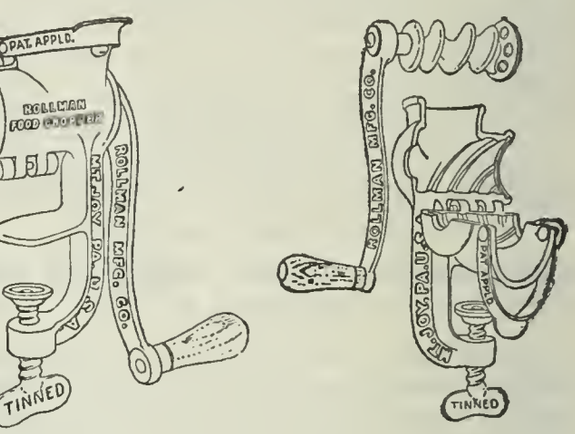


Fig. 1.—Rollman Food Chopper. *Fig. 2.—Chopper Open.*

Fig. 3.—Coarse, Medium and Nut Butter Cutters.

It is reported that the National Enameling & Stamping Company will discontinue their factory at Portland, Conn., and remove the plant to Brooklyn, N. Y. Considerable of the machinery has already been shipped to that city. The Portland plant, formerly operated by the Eastern Tinware Company, was established about ten years ago. Joseph Scheider was its manager until two years ago, when on its absorption by the National Enameling & Stamping Company the management was placed in the hands of Louis Haberman, a son of Vice-President Haberman. Mr. Haberman, it is said, will now become the manager of one of the other factories of the company. The Portland factory was the principal industry of that place, employing until a few weeks ago about 1000 men.

Stove and Hardware Dealers.

W. E. Everson, Union City, Pa., has favored us with a copy of the first issue of *Everson's Illustrated Hardware Bulletin*, which he has issued under date of February 1, 1902. The publication consists of a four-page circular, 12 x 9 inches in size, containing cuts and descriptive matter, together with prices, of the various lines of goods handled by Mr. Everson. These include the Majestic Ranges, Ruby and Germania Ranges and Stoves, New Process Oil Heaters, Plumbing Goods and Bathroom Fixtures, Flour and Spice Cabinets, Sewing Machines, Wash Boilers, Churns, Tea Kettles, Tea and Coffee Pots, Clothes Wringers, Pails and a variety of kitchen and household utensils. In a preliminary note Mr. Everson states that he proposes to present his *Bulletin* to the public on the first of each month. In addition to the articles named, he handles Hot Air Furnaces, Steam and Hot Water Boilers, Plumbing and Steam Fitting Supplies, Slate, Metal and Felt Roofing, Spouting, Tinners' Specialties, Bicycles, &c.

The Trotter Refrigerators, made by C. W. Trotter & Sons, 7 East avenue, Rochester, N. Y., form the subject of an illustrated blotter that is being distributed by that concern. In addition to their stock patterns, the company make special Refrigerators to order with white porcelain linings and icing from out of doors.

E. B. Fahrney, Waynesburg, Pa., formerly secretary and director of the American Mfg. Company, has purchased the patents and rights to the United States Cook Stove Fruit Drier from H. Rinehart and W. T. Omwake, assignees of the company named. We understand that Mr. Fahrney intends to make these Fruit Driers on an extensive scale and vigorously push them.

The Lawrence-Bostwick Mfg. Company, Phelps, N. Y., were recently incorporated for the purpose of making, among other things, the Bostwick Safety Thimble for stove pipes and hot air heating pipes, as well as a large number of useful household wares of tin and wood. The works will be equipped with the latest machinery, the buildings being those formerly occupied by the shoe factory in Phelps. The officers of the new concern are G. H. Parmalee, president; R. E. Connolly, vice-president; Dr. W. A. White, secretary, and John Bostwick, general manager.

C. E. Tyler has recently purchased the Stove, Range and Tinware business formerly conducted by F. E. Brockett, at 121 West Dominick street, Rome, N. Y. Mr. Tyler has been connected with the store for the past 12 years, and is thoroughly familiar with every detail of the business. We understand that the store will at once be rearranged and restocked with a complete line of Stoves, Ranges, Tinware and House Furnishing Goods, and that special attention will be given to furnace work and heating, as well as to copper, tin, sheet iron work and contracting.

R. R. Montgomery & Co. of Decatur, Ill., in an illustrated pamphlet which they are distributing describe their King Fly Killer, which is referred to as killing flies without crushing them. The device is made of wire netting, and in striking makes no breeze to blow the flies away, thus dispatching them easily and quickly.

Rankin & Mauck have succeeded Amos J. Rankin in the Hardware, Stove, Agricultural Implement and Buggy and Wagon business in Washington, Iowa.

Wm. J. H. Gluck, 218-222 North Gay street, Baltimore, Md., has sent us a batch of circulars calling attention to Watering Pots, Water Coolers, Ovens, Ice Cream Dishers, Nursery Refrigerators, Steam Cookers, Oil Heaters, Hot Plates, Tinware, &c.

E. Busket & Co. have lately engaged in business in Attica, Kan., handling Shelf Hardware, Stoves and Tinware, Sporting Goods, &c.

H. A. Le Roy Company have been incorporated with a capital of $25,000. They will conduct stores at Alexandria and Osakis, Minn., carrying a stock embracing Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

A new firm under the style of Phillips, Yarbrough & Allen have just bought out the stock of Hardware, Crockery and Stoves formerly carried by L. F. Dickson, Opelika, Ala. The stock is referred to as invoicing about $25,000. The new firm are composed of young men who have had considerable experience in the business. They request catalogues, quotations, &c.

Dayton & Vail are successors to C. O. Dayton in the Hardware and Stove business in Keota, Iowa.

Swinton & Co., Port Jervis, N. Y., are intending to add the sale of House Furnishing Goods, Wooden Ware, Novelties, &c., to their line, and will value catalogues, circulars, price-lists, &c., from the trade relating to these departments.

The postponed meeting of the Iowa Retail Hardware Dealers' Association will be held at Cedar Rapids on March 4, 5 and 6. The headquarters will be at the Grand Hotel. The programme will be the same as would have been carried out at Des Moines but for the dangerous spread of the smallpox in that city.

The Detroit Register Company, Detroit, Mich., have favored us with a copy of their illustrated catalogue and price-list for 1902, covering the various styles of Hot Air Registers and Ventilators manufactured by the concern. These are offered in black and white japan, electro plated, nickel, bronze, gold, silver and copper finish, also in solid brass, bronze and copper. The list includes a variety of handsome designs and in square, oblong, circular, semicircular and convex forms. Baseboard Ventilators, Sad Irons, Yankee Dampers, Stove Pipe Registers, Ash Pit Doors, and the Detroit Sink Bracket and Detroit Lawn Spray are other goods which the company are making; also the Detroit Hot plate, in one two and three burner sizes.

At the annual meeting of the Manitowoc Aluminum Company, Manitowoc, Wis., recently held, the following officers were elected: President, Henry Vits; vice-president, George Vits; secretary, William Pfleuger. The directors voted to increase the capital stock of the company from $20,000 to $50,000, this increase being decided upon in order that the company's factory might be materially increased in size and equipped with improved machinery, in order to keep pace with the enlarged demand for the concern's products.

H. E. Loving is moving his Stove and Tinware business to more commodious quarters corner of Augusta and Frederick streets, Staunton, Va.

Fire on February 14 completely gutted the main storeroom, office and basement of the Cash Hardware Store, Lewiston, Idaho. They were fully insured, however, and are assured of a satisfactory adjustment, which is now in progress. The matter of reconstructing and restocking will occasion some delay, but the concern will resume in all lines as speedily as possible. Their Farm Implement and Vehicle department was not injured, nor their stock of Nails, Wire, Pipe, Bar Iron, Sash and Doors and Wagon Wood Stock. Inasmuch as their office and its contents were entirely destroyed, they request manufacturers and jobbers to send catalogues and price-lists relating to Hardware, Tools, Builders' Material, Vehicles, Implements, &c.

What is regarded as a particularly clever engineering feat was consummated in New York City last week, when by the piercing of an immense bowlder 20 feet below the surface at the northwestern corner of Central Park the engineers of the new subway effected a junction of two borings of the tunnel with almost absolute precision. Work on one end of the great bores was begun at Lenox avenue and the other was started from Central Park West, 1725 feet of solid rock being cut through to accomplish the junction, which was made precisely as if the bore had been made by one continuous piece of tunneling.

A cement for marble is made from plaster of Paris soaked in a saturated solution of alum. This must then be baked in an oven and ground fine in a mortar. A small quantity should be used with water as plaster. It sets hard and may be rubbed down like marble and polished.

RETIREMENT OF RUSSELL W. M'KEE.

With the retirement of Russell W. McKee, for many years past the esteemed senior member of the well-known firm of Bruce & Cook, the metal trade of New York loses from its active list one of its oldest members—a man who, in the course of over half a century of business life, has secured for himself in a peculiarly large measure the confidence, respect and affectionate regard of a wide circle of friends, both in and out of the business world. As we reported in a recent issue, the copartnership of Bruce & Cook was dissolved by mutual consent on February 1, Mr. Kee. Elsey C. Cook and the Estate of I. R. Bruce withdrawing, the business being continued under the old style by a new copartnership composed of Spencer A. Jennings, Philander R. Jennings and Frank C. Jennings, nephews of the late John C. Cook, together with A. Gardiner Cooper, all of whom were members of the old firm.

It will afford pleasure to the many friends of Mr. McKee in all parts of the country to see the excellent portrait of this veteran of the trade which is presented herewith, and also to peruse the following brief sketch of his career:

Russell W. McKee was born on December 11, 1826, and is consequently in his seventy-sixth year. Coming, in 1846, to Brooklyn—which has ever since been his place of residence—he engaged in business in that city and in New York until 1855, when he entered the employ of the house with which he has been continuously identified for the long period of 47 years. At that date the tin plate and metal firm of John M. Bruce's Sons, as they were then styled, were reorganized, and John C. Cook, who had been an employee of the house, entered into partnership with Franklin W. Bruce, under the firm name of Bruce & Cook. Mr. Cook induced Mr. McKee, with whom he had come into close relations in mission work, in connection with the old Franklin Avenue Presbyterian Church of Brooklyn, to accept the position of bookkeeper with his firm. His success in his new field of labor was marked and he obtained rapid advancement in the business.

At first the business of Bruce & Cook was confined to the local trade in and near New York City, but the sphere of their operations was gradually extended, especially in the South, where the house did a large trade. Mr. McKee made many trips to the Southern States in the interest of his firm, both before and after the Civil War. At the time the war broke out Bruce & Cook had about $50,000 of outstanding accounts in the South. It speaks well for the estimation in which the firm were held by their Southern customers that they were able to collect of this sum 50 cents on the dollar at the close of the war. Mechanics were scarce and valuable in the South in those days. Consequently few of the firm's customers were drafted into military service, and they were in shape to resume business on the suspension of hostilities. Mr. McKee relates many interesting experiences of those stirring times. He was one of the two first civilians to enter the city of Richmond after its occupation by the Federal forces.

In connection with his early experience as a tin plate and metal salesman in New York City, it is interesting to note that he was the first to introduce ready made solder into the local tin shops, a line which has since become an important feature of the business of his house. The first solder was made in the basement of the firm's present quarters on Water street by Messrs. Cook and McKee themselves. It was only by persistent effort, however, that they succeeded in persuading the tinsmiths to use their material, as the latter were wedded to the solder of their own manufacture.

In 1868 Mr. McKee was admitted into partnership, and on the death of Mr. Cook, in 1892, he became the head of the firm of Bruce & Cook. To him is due in a large measure the success of the business and the enviable reputation which the firm have built up for faithful performance of obligations, courteous treatment and conscientious service of their customers and progressiveness in adopting every facility for the doing of business. Mr. McKee early adopted as his motto that of St. Paul, "Not slothful in business; fervent in spirit, serving the Lord." Out of his full and prolonged experience in business life he has analyzed the requisites for success into three elements—tact, push and principle. With these three, and ordinary intelligence, he believes that no young man can fail.

No sketch of his career would be adequate or characteristic of the man without a reference to his numerous activities in the sphere of religion and philanthropy. During the whole of his life he has been an active church worker, and at present holds the office of elder in the Throop Avenue Presbyterian Church of Brooklyn. For a long period of years he has conducted, in connection with that church, a large Bible class for young men. His instruction and advice have been of incalculable value to many men who have passed under his influence in that class and have since attained leading positions in various walks of life. To Sunday school work he has given especial attention. He is, at the present

RUSSELL W. McKEE.

time, president of the Brooklyn Sunday School Union, with which he has been connected for the last 40 years. His activities in this field extend well beyond his own city, he having held prominent positions in the New York State Sunday School Association, and he is still as actively interested as ever in the work. He is a strong supporter of the Young Men's Christian Association, a director of the New York Port Society and a friend and benefactor of many lines of religious and charitable effort. He is also an ex-president of the Society of Old Brooklynites, and has been connected with a number of other associations.

Mr. McKee's retirement from active business life now gives him the opportunity to devote all his energies to work for others. It will be a pleasure to his many friends to know that he still retains his desk in the office of Bruce & Cook, and, while not connected with their business, is constantly to be found at his old post, which he uses for the discharge of his philanthropic work.

A pleasant ceremony marked the retirement of Mr. McKee from the firm, when, on Friday, January 31, the last day of his connection therewith, he was presented with the handsome silver loving cup of which we present an illustration. The cup is of massive workman-

ship, with three handles, and bears the following inscription:

Presented to
RUSSELL W. McKEE
by his Partners and Employees as a testimonial of their regard and in remembrance of forty-seven years' association with the firm of
BRUCE & COOK.
1855. January 1. 1902.

On the other sides of the cup are engraved views of the Bruce & Cook buildings, on Water street and on Pearl street.

This token of the esteem and affection in which Mr. McKee is held by those who have been most closely associated with him was presented in a graceful speech by P. R. Jennings. The recipient, in response, expressed his heartfelt appreciation of the gift and of the motives which had suggested it.

It is with peculiar pleasure that *The Metal Worker* takes the opportunity of presenting this sketch of one of its earliest and most faithful friends. Indeed, Mr. McKee may be said to have been one of the godfathers of this paper, for it was largely through his suggestion that the idea of publishing a paper that would subserve the interests of the rank and file of tradesmen in the lines

Loving Cup Presented to Russell W. McKee.

which this paper covers was adopted. The familiar advertisement of Bruce & Cook, which appears on the back cover, was the first advertisement received, and it has stood in the same position ever since the initial issue of *The Metal Worker*, in January, 1874. This was, moreover, the first trade paper in which the concern in question ever advertised. Mr. McKee has been a constant reader of the paper throughout the 28 years of its existence, and it has ever found in him a sympathetic friend and supporter. *The Metal Worker* desires to tender to him its most cordial wishes for many years of health, happiness and usefulness in the community in which he lives, a sentiment that will be echoed by a host of friends in the trade.

Tin Plate Drawback Paid in 1901.

Figures have just been published by the Bureau of Statistics giving in detail the amounts of drawback paid by the United States on imported articles withdrawn from warehouses and used in the manufacture of articles exported during the fiscal years ending June 30, 1900 and 1901. Tin plate, of course, is the most important of all of the articles in which the foreign material is worked up in this country for re-export to foreign countries. In the fiscal year ending June 30, 1900, there were imported into the United States 125,269,156 pounds of tin plate, by far the largest quantity, 92,240,909 pounds, going into New York, 18,991,648 pounds into Philadelphia, 10,178,234 pounds into San Francisco, and 2,429,537 pounds into Chicago. The total amount of drawback paid was $1,848,792. In the fiscal year ending June 30, 1901, the quantity was slightly larger, being 127,261,883 pounds. Of this New York is credited with 101,174,989 pounds. Philadelphia with 10,517,444 pounds, San Francisco with 11,339,927 pounds and Chicago with 2,692,732 pounds. The total amount of drawback paid is $1,889,823.

Question of Gauge of Galvanized Sheets.

A controversy, says our London correspondent, is at the present moment taking place upon the question of the gauge of galvanized sheets. An English firm, having bought a parcel of galvanized iron, tested the weight according to official tables given in the *Ironmonger* diary for 1902. Finding that the weight for a given gauge and dimension did not tally with the weight stated in the invoice, they inquired as to the actual trade custom. One authority states, "If a buyer asks for 24-gauge galvanized iron, we should assume that he meant iron which, in its galvanized condition, was of 24 gauge, and that is what we should deliver." Another firm, however, say that their custom is to sell sheets which in the black are fully the thickness of the gauge specified. From inquiries made by the *Ironmonger* this latter course appears to be the general practice, especially among the larger makers. It would thus seem that there is no fixed rule in England governing the gauge, so that when buyers require sheets of a certain gauge it is necessary to state in the order whether the thickness refers to the material before or after galvanizing. American exporters would do well to make this point quite clear to their foreign buyers, particularly in the Australian market.

New Sheet Metal Workers' Alliance.

A meeting of the journeymen sheet metal workers of New York, Brooklyn, Philadelphia, Pittsburgh and Chicago was held in Pittsburgh last week, for the purpose of organizing a new association. Members of the trade in these large cities refused to affiliate with the existing National Association of Sheet Metal Workers, alleging that, in the present conditions of work, the differences between large cities and small towns are too great to allow of their submitting themselves to the limitations placed on the workmen in the smaller communities. The new association proposes to allow each and every union to fix its own wage rates. New York and Brooklyn workmen receive wages at the rate of 42½ cents an hour, while Philadelphia and Pittsburgh journeymen receive 37½ cents an hour. The convention decided to form a national alliance of the local unions of the cities above named. The membership in these unions now numbers about 7000. The action of the convention is subject to the approval of the local unions, and a vote will be taken when the delegates make their reports.

It was decided to name the new organization the Sheet Metal Workers' National Alliance of America. The officers chosen are: C. D. Wheeler of Chicago, president; John C. Steveline of Philadelphia, first vice-president; M. O'Sullivan of Pittsburgh, second vice-president, and Mervyn Pratt of New York, secretary.

Bishop's Eave Trough End Former.

The ingenious device manufactured by G. E. Bishop, Dowagiac, Mich., for closing the end of an eave trough, which has now been on the market for some years, is constantly growing in popularity among tinners. The tool closes the end of an eave trough in corrugations. This makes an eave trough frost proof and also gives a neat finish to the end of the trough. It avoids the use of any additional material to that contained in the metal of the eave trough itself. The device can be had from any jobber or from the manufacturer.

JAMES E. KELLEY & SON, New Haven, Conn., will do the gravel roofing in connection with the new building which the John S. Osborn Company are erecting in Allingtown for the Lion Brewery.

Pattern for a Y.

A correspondent from Milwaukee wishes to know how to cut the patterns for a Y for blow piping, sketch of which is shown in Fig. 1. In this A B C D E F G is the elevation of the Y, the vertical hight being 2 feet 4 inches, the lower openings 16 and 22 inches, while the top opening is 25 inches. H E shows the joint between the Y. I J K L in plan shows the true section on A B in elevation, while M N O P and R S T U show the true sections, respectively, on G F and D C in elevation.

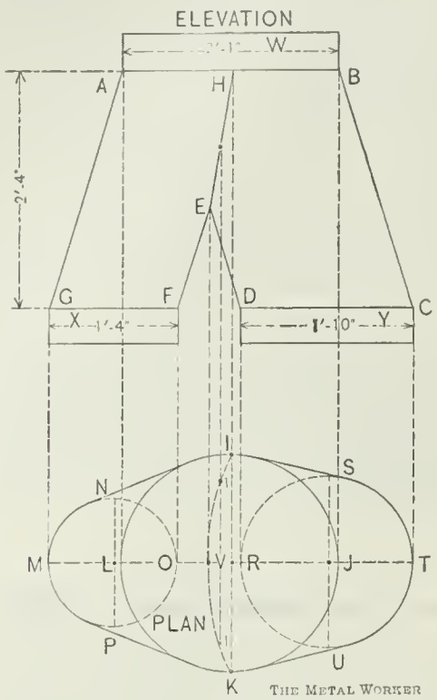

Fig. 1.—Plan and Elevation.

Draw lines in plan from N to I, I to S, U to K and K to P, which complete the plan of the Y when viewed from the top. Collars W, X and Y in elevation are put on separately.

The first step is to obtain a true section on E H in elevation, for which proceed as follows: Draw the vertical line H E in Fig. 2, equal to H E in elevation in Fig. 1. At right angles to E H in Fig. 2 draw the line K I, making H I and H K equal to V I and V K, respectively, in plan in Fig. 1. Then through the points K, E, I in Fig. 2 draw a section at pleasure, as shown. Then will K E I be the true section on E H in elevation in Fig. 1.

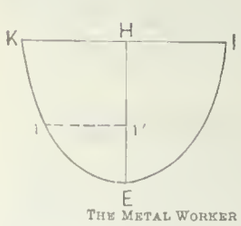

Fig. 2.—True Section on H E in Elevation, Fig. 1.

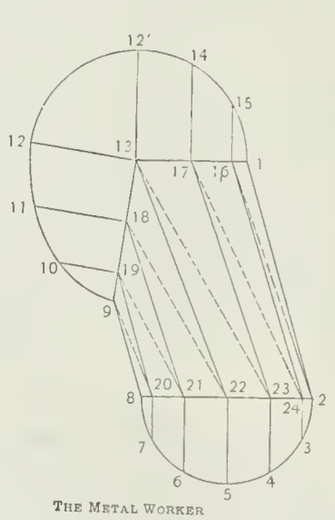

Fig. 3.—Obtaining Measurements for Sections.

If for any reason the miter line in plan is required on H E in elevation, it can be obtained by establishing any point, as 1 in K E in Fig. 2. From 1, and at right angles to H E, draw a line intersecting the line H E at 1'. Now take the distance of H 1' and place it as shown by H 1' on H E in elevation in Fig. 1. Then from H in elevation, and at right angles to A B drop a line intersecting the plan of the top at I and K. From E drop a vertical line intersecting the center line M T in plan at V, and from 1' in elevation drop a line as shown by 1' 1. Now set the dividers equal to the distance 1 1' in Fig. 2 and set off this distance on either side of the line M T in plan in Fig. 1 on the line 1' 1, thus obtaining the points 1 and 1. Then through the intersections I, 1, V, 1, K trace a line, as shown, which will represent the miter line in plan on H E in elevation.

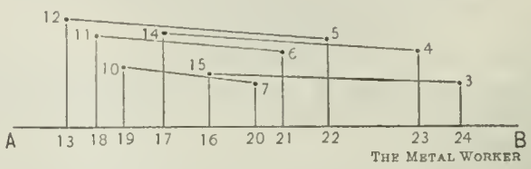

Fig. 4.—Sections on Solid Lines in Fig. 3.

The patterns for the two arms will be developed by triangulation, but before obtaining the patterns it will be necessary to construct a diagram from which the measurements can be obtained for the sections with which to develop the patterns. Therefore in Fig. 3 let 1 2 S 9 13 be a reproduction of B C D E H in elevation in Fig. 1. Now take a tracing of the half profile T U R in plan and place it as shown by 2 5 8 in Fig. 3. In similar manner take a tracing of I V J, the quarter circle in plan in Fig. 1, and place it as shown by 12' 13 1 in Fig. 3. Finally, take a tracing of the half section K H E in Fig. 2 and place it as shown by 12 13 9 in Fig. 3. Now divide the half section 1 12' 13 into equal spaces, as shown by 15 and 14; also the section 12 13 9 into the same number of spaces, as shown by 10 and 11. As these two sections contain six spaces, then divide the half section 2 5 8 into six spaces, as shown by 3, 4, 5, 6 and 7. Now at right angles to 1 13 and from points 15 and 14 draw lines intersecting the line 13 1 at 16 and 17. At right angles to 13 9 and from points 10 and 11 draw lines intersecting the line 9 13 at 19 and 18; then, finally, at right angles to 2 8 and from points 3, 4, 5, 6 and 7 draw lines intersecting the line 2 8 at 24, 23, 22, 21 and 20. Next draw solid lines from 16 to 24, 17 to 23, 13 to 22, 18 to 21 and 19 to 20, and dotted lines from 16 to 2, 17 to 24, 13 to 23, 18 to 22, 19 to 21 and 9 to 20.

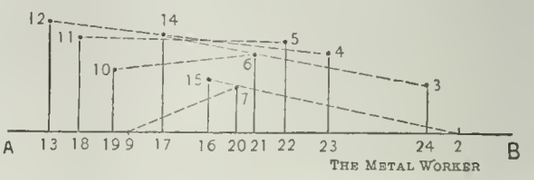

Fig. 5.—Sections on Dotted Lines in Fig. 3.

These solid and dotted lines represent the bases and the lines in the sections the altitudes with which to construct the sections, as follows: In Fig. 4 draw any horizontal line, as A B, upon which place the various lengths of the solid lines in Fig. 3, as shown by lines having similar numbers in Fig. 4. For example: Take the length of the solid line 13 22 in Fig. 3 and place it as shown by 13 22 on the line A B in Fig. 4. At right angles to A B and from points 13 and 22 draw the lines 13 12 and 22 5, equal in hight to 13 12 and 22 5 in Fig. 3. Draw a line from 12 to 5 in Fig. 4, which represents the true length on line of similar number in Fig. 3. In this way all of the sections on solid lines shown in Fig. 4 are obtained.

In precisely the same manner as described in connection with the section on 13 22 in Fig. 4 construct the diagrams on dotted lines in Fig. 3, as shown by sections having similar figures in Fig. 5.

For the pattern shape draw any vertical line, as 1 2 in Fig. 6, equal to 1 2 in Fig. 3. Now, with 1 15 as radius and 1 in Fig. 6 as center describe the arc 15. Then, using 2 as center and 2 15 in Fig. 5 as radius, intersect the arc 15 in Fig. 6, as shown. Now, using 2

as center and 2 3 in Fig. 3 as radius, describe the arc 3 in Fig. 6, which intersect by an arc struck from 15 as center with a radius equal to 3 15 in Fig. 4. Proceed in this manner, using alternately as radius first the divisions in the profile 1 13 12′ in Fig. 3, then the length of the dotted lines in Fig. 5, the divisions in the profile 2 5 8 in Fig. 3, then the length of the slant lines in Fig. 4, until the line 12 5 in the pattern is obtained. Then use the divisions as radius in the section 9 12 13 in Fig. 3, the dotted lines in Fig. 5, the divisions in 2 5 8 in Fig. 3, then the slant lines in Fig. 4, until the line 8 9 is obtained. Trace a line through intersections thus obtained in Fig. 6; then will 1 2 8 9 12 be the half pattern.

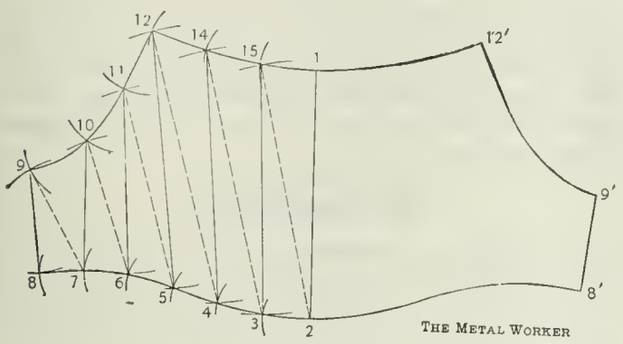

Fig. 6.—The Pattern Shape.

Trace the other half opposite the line 1 2, as shown. Then will 8 2 8′ 9′ 12′ 1 12 9 be the full pattern for the arm shown by B C D E H in elevation in Fig. 1, with seam at E H.

In precisely the same manner obtain the pattern for the arm E F G A H. On the line G F place the half section O P M in plan, on H E in elevation place the half section H I E in Fig. 2, while on A H in elevation in Fig. 1 place the quarter section V L I in plan. When the sections are all in place proceed as shown in connection with Figs. 3, 4, 5 and 6, being careful to have the seam at the shortest end, as at E H in elevation in Fig. 1. After the Y has been seamed or riveted together the collars W, X and W are joined separately.

A New Tin Plate Process.

Edwin Norton, president of the American Can Company, has recently patented a new process for the rolling of tin plate. The leading feature of the invention is to change the direction of rolling twice instead of once during the reducing operation.

Mr. Norton says in his patent specification, as quoted in *Tin and Terne*, that after the initial process of rolling the steel ingot into a tin plate bar, all the rolling is done in the same direction—*i. e.*, in the width of the tin plate bar, and that this successive and continual rolling in the same direction injures the strength and quality of the metal and causes the finished product of thin sheets or plates to have too little coherence, strength and tenacity except in a direction across the grain or fiber of the metal produced by such continuous rolling in one direction. Also, the rolling by the present method involves the repeated handling and passing between the rolls of very small rolling units, starting with the tin plate bar of a width of only, say, 8 inches. This involves substantially as much labor as would the handling of much larger rolling units.

It is stated to be the object of the invention to overcome the difficulties mentioned and produce a sheet of much better quality as to ductility, strength and toughness. The process consists of the following steps:

1. Rolling the ingot, of any convenient weight and dimensions, into what may be called a "wide billet bar" about 20 inches wide by about 1.808 inches thick and 30 to 40 feet long, according to the weight and size of the ingot. The width dimension is preferably one of the dimensions of the singles or of the finished product.

2. Shearing this wide billet bar, with its initial heat, into pieces 20 x 28 inches and 1.808 inches thick.

3. Rolling these pieces, with their initial heat, in the cross direction from that of the previous rolling—*i. e.*, in the 20-inch way—into thin bars, say 28 x 80 inches, making them about 0.45 inch thick, passing the pieces back and forth between reversing rolls, so that the rolling action is alternately in opposite directions.

4. Continuing the rolling of these wide thin bars at the same initial heat and in the direction of their length into a long wide thin plate about 28 inches wide and 34 feet long, and about 0.1 inch thick. This final rolling action at the initial heat reduces the ingot to the thickness of the singles, and is preferably performed by a continuous train of five stands of rolls. The product of this operation is called for convenience "singles plate."

5. Shearing the wide thin singles plate thus produced into singles ready to match, the size being 20 inches net or 20¼ inches, to allow for scrap, by 28 inches by 0.1 inch thick.

6. Matching the singles, reheating and further rolling in pairs or packs of two in the cross direction from the last previous rolling—*i. e.*, in the direction of the length of the singles—extending the length of the pair to 56 inches, the width remaining 20 inches net.

7. Folding or doubling the pair, reheating and again rolling in packs of four, thus again doubling the length to about 56 inches net.

8. Finally, again doubling, reheating and rolling in packs of eight thicknesses until the sheets are reduced to the required gauge, their length being again doubled to about 56 inches, or twice the length of the finished product, in case sheets 20 x 28 are being rolled, as has been supposed in describing the process.

It is pointed out that by this process the steel is reduced to a thickness of 1-10 inch with the initial heat, thus saving one reheating and the direction of rolling is changed twice instead of once.

Foot Warmers.

BY B. WOODS.

Notwithstanding the advances made in the method of heating buildings from the time of Benjamin Franklin's open stove, the foot warmers of his day are still in demand by those who have occasion to drive teams during the severe winter weather. Having seen a suggestion in *The Metal Worker* a few years ago that a tin vessel, arranged with a can screw for filling and emptying, and of a suitable shape to be used in a wagon, could still be sold by the enterprising tinsmith for use as a foot warmer, I decided to make some up of these articles last fall and am pleased to report that they have met with a good sale. Hot water for filling them can be had not only at the start of the journey, but, in case of necessity, at any house along the road, and if the foot warmer is made to hold a sufficient quantity and is wrapped up in a blanket, the heat given off will add substantially to the comfort of the driver for a long time. I have made these foot warmers of one and two cross tin, according to their size, and in size 10 inches wide on the bottom and from 14 inches to 2 feet long. I formed them slanting on the top, so that they would be 1½ inches high on the front and as much as 5 inches high on the back. I was careful to secure large can screws, so that they could be readily filled from a teakettle. In the larger and longer sizes I soldered braces on the inside before putting on the ends, which were double seamed on.

British Tin Plate Exports Increasing.

Our London correspondent reports the exportation of tin plates from Great Britain in the month of January as follows: The exports of tin plates during the month of January to the United States showed a large increase both in volume and value, 7977 tons, compared with 4673 tons in January of last year, and valued at $540,000, compared with $300,000 during the same period last year. The exports of tin plate to Russia during the month of January have been 4075 tons, compared with 3124 tons last year, and valued at $275,000, compared with $170,000 in January last year. Owing to these unusually large consignments the tin plate trade has been busy. Another important feature of the tin plate trade is the increase in the amount of plates sent to small unenumerated countries, 4892 tons, valued at $340,000, the largest monthly export of tin plates for some years past.

The Auld & Conger Company.

The firm of Auld & Conger, Cleveland, will be succeeded by the Auld & Conger Company, a corporation organized under the laws of Ohio, with a capital stock paid in of $150,000. The Board of Directors and officers of the new company are as follows: D. Auld, Jr., president; J. W. Conger, vice-president and treasurer; D. E. Reynoids. secretary. W. D. Jones, T. A. Parker, F. H. Conger and L. M. Auld, with the above named officers, form the Board of Directors. This will involve no change in the management, as the change was made for the purpose of allowing a number of old employees to become interested in the business. The firm of Auld & Conger have been in existence since 1869 without a change of any kind in the firm name, being the oldest firm in the United States engaged in the manufacture of roofing slate and other slate products. In fact, the partnership has existed since 1862, for, while in the army, both members of the firm served in the same regiment and company for four years during the Civil War. The old firm bespeak the same liberal patronage for the new company that the old firm received.

McKeesport Tin Plate Company.

Several months ago some prominent capitalists of McKeesport, Pa., organized the McKeesport Mfg. Company for the purpose of building a large tin plate plant. It has recently been decided to change the name to the McKeesport Tin Plate Company, and a site for the new plant has been selected at Port Vue, just across the Youghlogheny River from McKeesport. The plant will contain ten mills, and contracts for the buildings and nearly all the equipment have been let. The company have acquired 14 acres, having direct connection with the Pittsburgh, McKeesport and Youghlogheny division of the Pittsburgh & Lake Erie Railroad. The hot mill building will be 60 feet wide and 350 feet long. It will be of steel frame construction, particular attention being given to light and ventilation. There will be two leantos, one 25 x 350 feet and one 15 x 350 feet. This main building will contain ten hot mills, sheet and pair furnaces, modern shears for cutting bars and delivering same to heating furnaces for rerolling and finally to the hot mills. The building will be commanded by two 15-ton electric traveling cranes, furnished by Whiting Foundry & Equipment Company of Chicago. The annealing and cold roll building will be 75 x 350 feet, equipped with two double annealing furnaces, built by the Forter-Miller Engineering Company of Pittsburgh, and ten stands of cold rolls. This building will also be commanded by two 15-ton electric traveling cranes, furnished by the Whiting Foundry & Equipment Company. The machine shop will be 40 x 50 feet in size and will be equipped with modern iron working tools throughout. The engine room will be 40 x 100 feet, and will contain two hot mill engines each 28 x 60 inches, to drive ten stands of hot rolls, one engine, 28 x 48 inches, driving ten stands of cold rolls, both furnished by the Bass Foundry & Machine Company, Fort Wayne, Ind. The tinning house will be 50 x 220 feet and will contain 19 tinning sets of modern type. The assorting and stock room will be 50 x 360 feet and will be used for assorting and trimming and also for storage. The boiler house will be 25 x 125 feet, seven batteries of Sterling boilers, each of 300 horse-power, giving a total of 2100 horse-power water tube boilers. The electric light and power plant will consist of two 150-kw. generators, driven by a Harrisburg Ideal engine, 18 x 18, furnished by the Harrisburg Foundry & Machine Company. The hot and cold stands of rolls, squaring and double shears and bar shear will be furnished by the Wheeling Mold & Foundry Company of Wheeling, W. Va., who have recently erected large foundry and machine shops for turning out sheet and tin mill equipment. The contract for the steel buildings has been given to the Fort Pitt Bridge Company, Canonsburg, Pa. The McKeesport Tin Plate Company have, we are advised, ample capital, and it is intended to make this plant a modern one throughout. The very best equipment is being provided. The plant will be operated throughout by electric motors, with the exception of the hot and cold mills.

The management of the plant will be under the direction of E. R. Crawford, who for 14 years was connected with the United States Works of the American Tin Plate Company, at Demmler, near Pittsburgh; also J. E. Lauck, who was originally with the Star Tin Plate Company, in Pittsburgh, and later at the United States Works of the American Tin Plate Company. It was under the direction of Mr. Lauck that the United States Works were rebuilt and enlarged and a number of new mills added. Both of these gentlemen will bring a wide experience in the manufacture of tin plate to the new company. It is intended to push work on the new plant as fast as possible and the concern hope to be making tin plate by next October. The output of the plant will be from 1200 to 1500 boxes per day. Plans for the building and equipment were made by S. Diescher & Sons, consulting engineers, Hamilton Building, Pittsburgh. This will be one of the largest tin plate plants in the country.

FLASHINGS.

On Thursday a meeting was held in New York of the presidents of the constituent companies of the United States Steel Corporation. At this meeting plans for needed improvements and additions to the works of the companies were presented and discussed. Large sums in the aggregate are involved.

E. H. Friedrich, Holyoke, Mass., has the contract for the roofing and copper work in connection with the addition to the plant of the Dean Steam Pump Company.

It is reported that C. H. Curtis and E. J. Strong, who organized the Curtis Sheet Steel & Corrugating Company of Zanesville, Ohio, have sold out their interests in that concern.

The Youngstown Iron, Sheet & Tube Company have bought a tract of iron ore property on the Mesaba range of 80 acres, and have leased two other properties near Eveleth.

G. M. Hayes, Columbus, Ga., informs us that he would be glad to receive catalogues from houses manufacturing Metal Ceilings, Metal Shingles and Cornices.

F. R. Phillips & Sons Company of Philadelphia have recently opened an office at 339 Fifth avenue, Pittsburgh, where F. Rees Phillips will be permanently located. They find this necessary to take care of their largely increased business in that section. They have of late taken several contracts for Sheet and Tin Mills, Machinery, Chilled Rolls, &c. In connection with their foreign business, they have imported considerable Steel of late and placed orders for a very large tonnage, principally for Eastern mills. With their Pittsburgh office they will be in a position to deal directly with Western mills.

The new heating furnaces at the Falcon Works of the American Tin Plate Company, Niles, Ohio, are said to be working very successfully. The furnaces were designed by William Banfield, district manager, and William Dixon, and show a saving in fuel of about 50 per cent. They heat the iron more uniformly without causing scale. All the furnaces at the Falcon works will be changed to this style. More Black Plate is used at the Falcon works than the hot mill capacity will provide, and for this reason Black Plate is sent to this plant from other works of the American Tin Plate Company. The Falcon works contain six mills, and it is not intended to increase their number at this time.

It is probable that the Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, will again increase their capital stock $1,000,000 or $1,500,000. It is stated that it is the intention of this concern to put up structural mills to roll Beams, Channels and other shapes. In the inception of this concern the capital stock was $800,000, but it has been increased a number of times and is now $4,000,000.

We are advised that the statement that the General Fire Proofing Company, recently organized in Youngstown, Ohio, would work very closely with the Youngstown Iron, Sheet & Tube Company, and would buy the

greater part of their raw material from that concern, is untrue. The General Fire Proofing Company are a separate and distinct concern from the Youngstown Iron, Sheet & Tube Company in every way, and will buy their material in the open market wherever they can do so to best advantage.

James O'Connell and Michael O'Dowd have entered the tinsmithing and furnace business, at Terre Haute, Ind.

John P. McCrea, late with L. & R. Wister Company, representing the American Sheet Iron Company, has secured an engagement in the sales department of the American Sheet Steel Company and is located in their New York offices, Battery Park Building.

The various lodges of the Amalgamated Association have begun the election of delegates to the annual convention of the association, which meets in Wheeling, W. Va., on April 15. The time for the election of delegates extends until March 1. At Wellsville, Ohio, where the lodge of the Amalgamated Association suffered considerably through desertions, occasioned by the strike last summer, a special effort will be made to renew interest in the organization.

The American Can Company have decided to establish a Tin Can factory in Denver, Col. The company absorbed the factory of the Eaton-Ritchell Company, at Denver, but this factory was burned last summer. Since that time Denver consumers of Tin Cans have been obliged to purchase their supplies from Eastern factories. It is stated that the new factory will be in charge of Edward C. Ritchell, and that it will be of large capacity to meet the requirements of the local packing, provision and fruit canning companies.

The Lalance & Grosjean Mfg. Company have started a fine foundry at their Tin Plate mills, at Harrisburg, Pa. The department was constructed under the personal direction of J. P. Luce, the manager, and has been warmly commended.

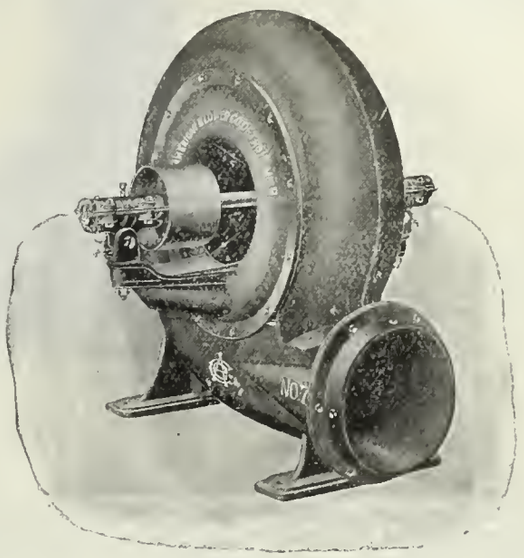
The limit of time for making suggestions for the schedule of work for the convention and changes in the scale of the Amalgamated Association for the Wheeling convention, in May, closed last week. The lodges of the association have been prompt in sending in their suggestions.

A meeting of the stockholders of Follansbee Brothers Company of Pittsburgh, manufacturers of and dealers in Tin Plate and Metals, will be held in that city on April 21 for the purpose of voting on a proposed increase in the capital stock of the concern from $300,000 to $800,000. The increase in capital will be used in developing the business of the concern, and also for the building of a plant to contain four Sheet and four Tin mills, which will likely be erected in the Pittsburgh district.

It is said that the independent Sheet manufacturers, at their meeting last week in Pittsburgh, decided to send a commissioner to England and Germany to buy sheet bars. A number of the independent Sheet mills have found their operations seriously hampered of late by inability to secure a sufficient supply of steel, owing to the shortage of billets and bars.

Wm. P. Price, James E. Mister, Jos. P. Price and others have incorporated the Price-Mister Can Company, at Baltimore, Md., for manufacturing Tin Cans, &c., with a capital of $3000.

It is understood that the H. J. Heinz Company have placed an order with the American Can Company for their supply of Tin Cans for a year. Specifications on this contract will be about 1,000,000 Cans a month, and the cost, according to average prices that the ordinary consumer of Cans must pay, would be nearly $250,000.



Charles A. Conklin and John N. Goddard are the incorporators of the Conklin Tin Plate & Metal Company of Atlanta, Ga., with a capital of $60,000. The company will deal in Tin Plates, Metals, &c.

The Southern Metal Company, Orangeburg, S. C., recently incorporated, have begun the manufacture of Steel Ceilings, Galvanized Iron Cornices, Light Wrought Iron Work, &c., and will, in addition, manufacture Sheet Iron Heaters and Tin Wares.

"A B C" Volume Blowers and Exhausters.

The accompanying cuts illustrate one of the latest lines of "A B C" volume blowers and exhausters, made by the American Blower Company, Detroit, Mich. The usual distinction between a "blower" and an "exhauster" obtains—viz., the blower has inlets on both sides, as shown in Fig. 1, while the exhauster has but one inlet, as shown in Fig. 2.

The shell, Fig. 3, is cast in one piece. The side plates, Fig. 4, are removable and reversible, a feature of great

The "A B C" Volume Blowers and Exhausters.—Fig. 1.—A Blower.

value, making it possible to suspend the fan from the ceiling or bolt it to a wall or partition, the plate on the side being reversed so as to bring the boxes into their original position. In the case of the exhaust fan, it is only a few minutes' work to change it from a right to a left hand fan, as the side plates are also interchangeable.

The circular side plates, above referred to, are larger in diameter than the fan wheel, so that the latter may be removed without taking the whole fan to pieces, as shown in Fig. 5. The wheel consists of a malleable iron

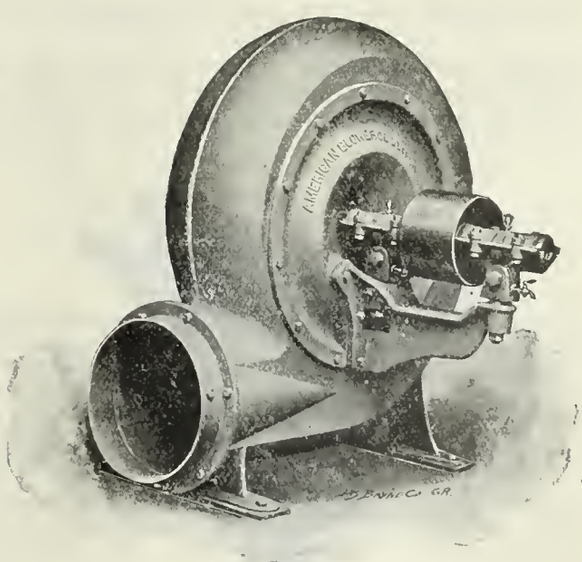


Fig. 2.—Left Hand Bottom Horizontal Discharge Exhauster.

hub, with malleable iron spiders, to which are riveted steel plate blades.

Special attention is called to the bearings, Fig. 6. They are lined with babbitt metal, bored out smooth and true. A feature introduced in this bearing is the forged vertical pin and the journal box knee. This device makes the bearing self aligning in all directions, without loosening a bolt or nut, and insures an absolutely cool running

bearing under any condition. They are provided with large oil chambers. The oil is carried up to the shaft by means of a ring, and then flows back to the oil chamber. Provision is made for drawing it off at the bottom of the box when it becomes thick from use.

The proportions of inlet to outlet, of blade area to

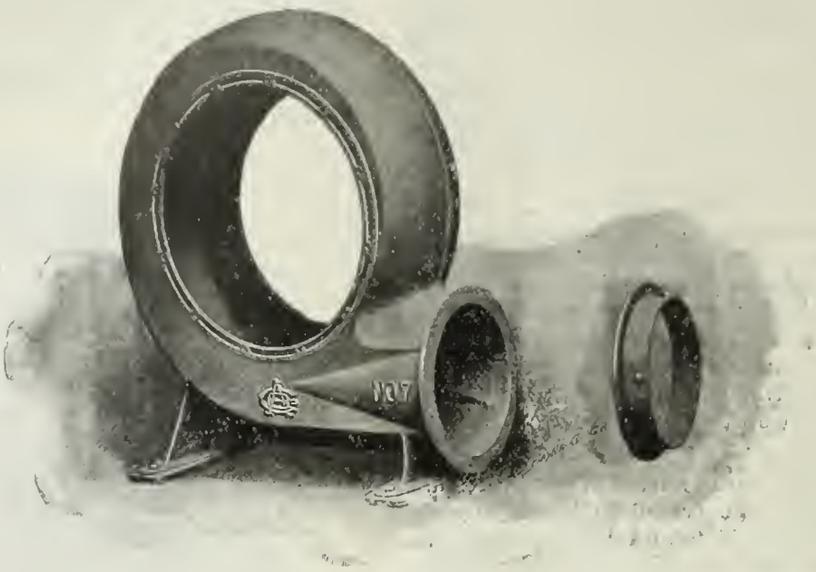

Fig. 3.—The Shell.

both of these and of the case to the whole are such as to give the highest efficiency obtainable in this class of machines. This type of blower is especially adapted for

Fig. 4.—The Side Plate.

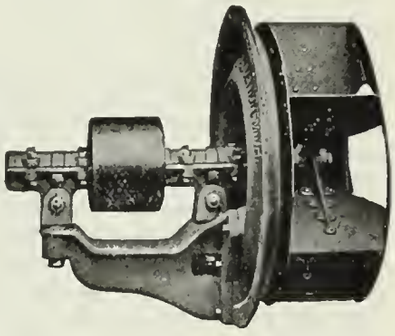

Fig. 5.—Fan Removed From Shell.

supplying draft to boilers, for blowing forges and furnaces and for use in connection with the various mechanical stokers. The exhauster is specially adapted for

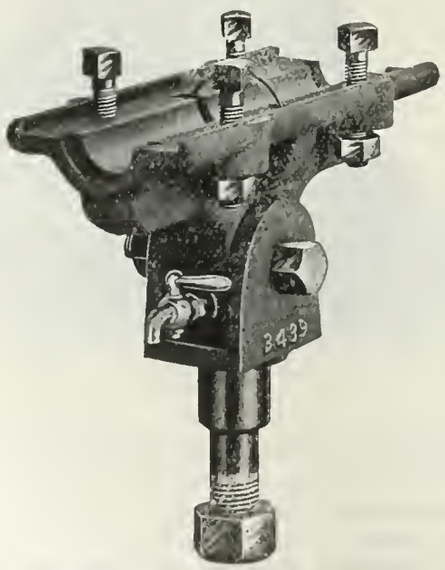

Fig. 6.—The Fan Bearing.

exhausting dust from emery wheels and grinding machines, as the cast iron case resists the wearing action of the dust and grit.

Manhattan Master Plumbers' Dinner.

The dinner given at Shanley's on Wednesday evening of last week by Manhattan Branch of the Master Plumbers' Association of New York City to Superintendent of Buildings Perez M. Stewart was probably the most successful and enjoyable banquet ever given by that organization. Among the guests present were Hon. Jacob A. Cantor, president of the borough of Manhattan; ex-Sheriff Dunn, Judge Julius M. Mayer of the Court of Special Sessions, Col. Abe Gruber, Superintendent of Highways Collins, Chief Plan Clerk Lee of the Tenement House Department, former Water Commissioner Dalton, and former Superintendent of Public Buildings Donovan. President A. H. Brown acted as master of ceremonies.

In the course of his remarks Superintendent Stewart said that he trusted the plumbers would think as well of him at the end of his term as at the beginning. He also remarked that this dinner was the only ray of sunshine that had crossed his path so far in his administration, and that the plumbers were the only building trade organization that had visited him. Col. Abe Gruber said he never thought he would live to see the day when plumbers would ever give anything away, but this dinner proved that he was wrong. He then recited the following poetical effort:

"It is hard to believe, said Morgan to Gould,
That no master plumber has ever been fooled;
Their knowledge of water and art in a pinch,
Has given them all a 'lead pipe cinch.'
While others may bite at our bonds and our stocks,
The plumber has put his good money in his socks."

"Tom" Dunn followed with observations based on his acquaintance with Tammany Hall, "Goo-Goos" and Republicans.

Judge Mayer, former National Presidents Malcolm, Byrns and Mitchell, Superintendent Collins, James Muir and others also spoke.

Flint & Walling Mfg. Company, Kendallville, Ind., manufacturers of the well-known Star Wind Mills and Water Supply Goods, have found it expedient to concentrate the business interests and management of their Eastern, domestic and foreign trade, and have recently opened an office at Room 1, 76 Broad street, New York. C. S. Geauque, who was formerly manager of this company's office at Philadelphia, and who is thoroughly conversant with the line, has the management and control of the new office. This change was found absolutely necessary in order to more fully meet the requirements of customers, both at home and abroad, and it is the intention of this company to work the trade vigorously the ensuing year. Any information desired pertaining to this line will be promptly furnished by addressing the company at their new office.

A LOUNGING CHAIR MADE OF PIPE.

BY MARTIN L. KAISER.

The porch chair shown in Fig. 1 is made of old ½-inch wrought iron water pipe aud fittiugs, and should cost the mechanic nothing, except for the canvas and for the bolts used, aside from the odd hours employed in its construction.

It will be noticed that no unions are used to put the frames together. The last piece of each frame (prefera-

A Lounging Chair Made of Pipe.—Fig. 1.—A View of the Chair in Use.

bly one of the shorter pieces) has a long aud a short thread. This piece is first screwed the full length of the long thread in the fitting, and then uuscrewed, while the short thread is being screwed into the opposite fitting. The dimensions of the two frames, together with the location of the bolt holes, are shown iu Figs. 2 and 3.

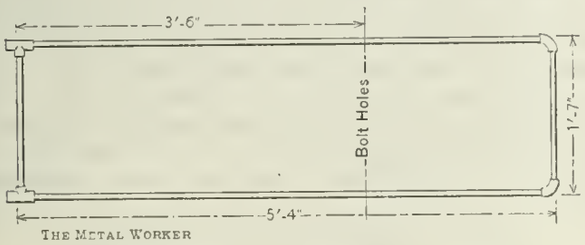

Fig. 2.—Outside Frame.

The bolts used at the point of couuection of the two frames are 2 x ¼ inch round head stove bolts. In the unused ends of the tees may be screwed ornamental pieces made of iron, lead or wood. To provide the necessary adjustment, which may vary from almost horizontal to almost vertical, a strip of ¾-inch hard wood, 3 inches wide and 3 feet long, is prepared with a row of ½-inch holes spaced 2½ inches apart down the center, as shown in Fig. 4. This strip should be

Fig. 4.—Adjusting Strip.

Fig. 5.—Metal Clip.

Fig. 6.—Adjusting Rod.

bolted to the cross bar of the front leg of the chair by means of a clip made of heavy sheet iron, as shown in Fig. 5, and 1 x ¼ inch flat head stove bolts, with heads down to prevent the bolts from scratching the floor. The flattened eye of a ⅜-inch rod, about 2 feet long, should be slipped on the cross bar of the rear leg, with a hook on the opposite end, as shown in Fig. 6, to engage the holes in the hard wood strip. A piece of strong canvas fastened to the upper cross bar of each frame completes the chair.

The iron pipe frames may be enameled or painted tastefully, and striped awning canvas can be used if desired. Instead of placing ornaments in the tees at the front of the chair, the ends of a removable foot rest to hold a cushion may be iuserted. The writer has had one of these chairs in use for ten years, and has just recently made another. While not built for two, it is amply strong for a person of ordinary weight. Owing to the inexperience of the photographer, the occupant of the chair is credited with rather more of feet than he ordinarily carries.

High Pressure Hot Water Heating.

In response to the letter of a correspondent, A. T. Hoyt presents the following in the *Florists' Exchange* on the subject of high pressure hot water heating:

I wish to state a few facts so that those who wish to do a high pressure hot water job may know some of the facts that must be taken into consideration. Water boils and makes steam at different temperatures, from 100 degrees F. in vacuo to 212 degrees sea level with open atmospheric pressure (14.7 pounds per square inch.) Increasing the pressure above one atmosphere raises the degree of heat necessary to boil water and no steam can be generated until the boiling point is reached. With the gauge showing zero the boiling point is at 212 F.; gauge showing 5 pounds the boiling point is 228 degrees F.; at 10 pounds it is 240 degrees; at 15 pounds it is 250.4 degrees; at 20 pounds it is 259.3 degrees; at 25 pounds it is 267.3 degrees; at 30 pounds it is 274.4 degrees; at 35 pounds it is 281 degrees; at 40 pounds it is 287 degrees, and at 100 pounds it is 338 degrees. It is necessary to raise the temperature of the water in the boiler to the different degrees of heat noted under the different pressures noted before the boiling point is reached or steam generated, without regard to the cause of the pressure, as the pressure is what retards or raises the boiling point degree of heat. The pressure may be from steam confined in the boiler or pipiug (as steam exerts pressure only when confined); or it may be caused by elevation of a column of water whose lower end enters the boiler so as to sustain that column, and this column may be simply 1-inch pipe, or a pipe 16 feet in diameter, or a tank of 1000 or more gallons, elevated. At 1 foot above top of boiler, or above the gauge, the pressure is 0.434, and to get the actual pressure from a column of water multiply the hight (above the gauge) in feet by 0.434, and this will give the actual pressure in pounds. A tank

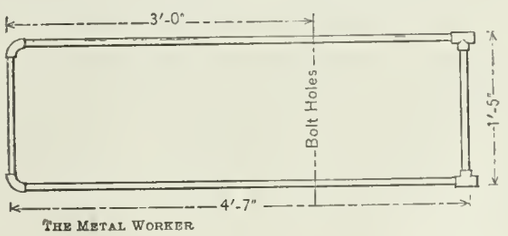

Fig. 3.—Inside Frame.

with 40 feet elevation above boiler or gauge will give 17.36 pounds actual pressure, and will retard the boiling point from 212 degrees to near 255 degrees; and, of course, a circulation can be had from this pressure that in degrees of heat will be above a tank with less elevation. The matter of closing the tank does not affect the pressure from that of the open tank until the boiling point is reached.

The only advantage in the pressure system is that the boiling point is raised, and consequently harder firing can be done, and a higher temperature gained in the circulating water; but it is a law of mechanics that something cannot be made from nothing, and the economy is in favor of no pressure above what cannot be avoided; and a system where the circulation can be carried at 212 degrees, or below it down to 100 degrees, is far cheaper than any pressure system. But the open elevated tank pressure is the safest and best pressure system, and operates just the same as the closed system until its boiling point is reached.

PLANS A HELP TO THE TRADE.

BY "BLAZES."

How often it is, in the heating business, that cases are found which compel one to believe that some of the people engaged in it are either totally blind or without reasoning faculties. "All coons look alike to me" about sums up their conception of conditions. Exposure means nothing to them; speculative buildings have no terrors for them; they go blandly on, figuring the house on a mountain top very much in the same way as to boiler power and radiation as they would the house in the middle of a sheltered city block. When the man on the mountain top complains of the lack of heat and the tremendous consumption of fuel, he is tranquilly invited to pore over the city man's job as a sample of the correctness and success of their methods and the one and only kind of work they do.

I was invited a short time since by an acquaintance who had purchased a house in a suburban district to go with him and examine the steam heating apparatus. He assured me that the idea of steam heat had been a strong factor in deciding the purchase. He wasn't sure, now, but suspected he had bought a "brick" and wished to be certain of it. Two things he had become fairly confident of, were, first, that neither he nor any of his amateur friends could ever unlock the mysteries of this apparatus, so far as heat was concerned, and, secondly, he didn't like the noise it made.

To be brief, the boiler was of a round sectional type, with 18-inch firepot, which, according to most liberal allowances for ingeniousness of construction, would be rated at 325 square feet of radiation. This, however, had no ingenuity in its construction, or rather its design, therefore 300 feet was a safer limit. Careful computation of the surfaces in radiation and exposed piping showed the total amount on the job to be 405 square feet, at least 80 feet more than the extreme limit of the boiler and fully 130 feet more than any thinking tradesman would put on it.

Another astonishing feature of this apparatus was that each of the rooms on the first floor had exactly the same amount of radiation, despite the fact that there was a world of difference as to their exposures and a great difference in their contents. Each of the three principal rooms on the second floor had also the same sized radiator, although the front room was twice the size of the adjoining one, and had a bay window facing north, also two windows facing east, while the smaller one had one window in its one eastern exposure.

The piping was small in every instance, and was run on the principle that 2-inch pipe costs more than smaller sizes; hence the 2-inch main (?) ran in a circuit (one pipe work), 7 feet being the furthest it wandered from the boiler; the connections to first floor radiators and to risers varying in their horizontal runs from eight feet to 21 feet in length. These were graded to run the condensation back to the main.

Any fitter can easily imagine what all this meant. After estimating on a proper sized boiler, new mains, and, in some cases, new risers, making necessary additions to radiators, changing valves, etc., etc., a cost was arrived at which easily exceeded the figure paid for the original work. My friend sold the house.

He has since started another house, and, in spite of my assurances that he can have a satisfactory apparatus put in, he declines to consider steam, and intends putting in hot air. Some of his other friends have jollied him on that point, but he says if that doesn't go, he can put up stoves and is having chimney openings made with that possibility in view. My friend has since told me that, through social intercourse with his neighbors, he has learned of at least a dozen jobs around him, all steam, and not two of them satisfactory, so far as the amount of heat is concerned. Half of these jobs have been put in by the same man who did the above. Steam heat, in this particular community, seems to have become a sort of joke.

I had intended bringing this article to a different ending, but in reading an editorial in *The Metal Worker* of February 1 on "Making Plans," it struck me there was room for a little argument on some of the points put forward by the fitters against the practice of making plans for their customers by the manufacturers and supply houses. The case I have described above might be considered an illustration of the desirability of making plans, etc.

I am speaking from the standpoint of a fitter, for that is my means of livelihood. I am not engaged in the manufacture of boilers, nor in selling them, other than putting them up where I can secure a contract for doing so. The question comes up to me, and very vividly, too, "How often, in estimating on steam heating work, is the figuring confined to competent men—on the spot?" For myself, I can answer that in figuring on the class of work for which these plans are made—dwelling houses in the majority of cases—I find that there are men against me whom I know to be incompetent. In eight cases out of ten, one of these men secures the contract. Why? Because of his figure. Many will say, "Oh, that sort of thing will cure itself and these fellows will drop out as soon as they see how much money they are losing and the trouble they get themselves into." Many do drop out, but others step in to take their places. The man who waits for this condition of things to cure itself will sit down and wait for any other impossible old thing.

If these people must be in the business is it not better that the supply houses or manufacturers should guide and instruct them by means of plans and specifications than allow them to go on in their wild career, wrecking their own business and giving steam and hot water heating a black eye on all sides? I would sooner a good deal figure against men who I knew had plans and specifications behind them, made by a good, responsible concern, than I would against men who year after year unload such work as in the case above cited. This man has nothing behind him but his nerve.

The average boiler salesman is usually selected for his position on account of his knowledge of the art of placing his goods, as well as for his good looks and successful selling powers. He knows that he must sell goods so that his firm may not be cumbered with afterclaps. If his business is too troublesome, he knows what he may expect, hence he tries, at least, to avoid uncertainties and endeavors to sell goods that will be capable of doing satisfactory work.

Even figuring from a set of plans and at a distance from the job, are there many supply houses or manufacturers who would be foolish enough to keep in their employ men who would lay out and specify such a piece of work as in the case above described? I fancy not. I am convinced that the practice of furnishing plans and specifications to the trade is a good one; that it tends to even up competition and gives the "competent" men a better chance for business than they would otherwise have.

Death of Philip H. Lenderking.

Philip H. Lenderking, a well-known citizen of Baltimore, died on February 21, at the Maryland General Hospital. About three weeks ago Mr. Lenderking contracted a cold, and on Wednesday of last week took to his bed. He grew rapidly worse and on Monday was removed to the hospital. The funeral was from Mr. Lenderking's home, 1803 North Payson street, on Sunday afternoon, and the interment was made in Loudon Park Cemetery.

Philip H. Lenderking was born in Hesse, Cassell, Germany, June 17, 1843, and came to this country in 1857. His parents settled in Baltimore, where the deceased learned the tinsmith trade. When the Civil War broke out Mr. Lenderking, who was only 18 years of age, enlisted in the Union Army and served until 1864, when he was honorably discharged. At the close of the war he settled in Lexington, Va., but returned to Baltimore in 1868, and the following year established himself in the business of a coppersmith, plumber and gas fitter and the sale of stoves and house furnishing goods at 203 West Pratt street. The deceased was a prominent Republican and had a strong following among the Germans. He was a member of the Maryland Legis-

lature of 1898. He was also a member of the Grand Army Club, Wilson Post No. 1 of the G. A. R.; Union Veteran Legion, Germania Maennerchor, De Kalb Lodge, Knights of Pythias, the German-American Lincoln Club and the Old Baltimore City Guard, of which there are not more than a half dozen surviving members. Mr. Lenderking leaves a widow and nine children.

SUGGESTIONS ON HOT WATER PIPING.

BY V. I. C.

Hot water is coming to be recognized as an excellent method of heating private residences; so much, in fact, that a number of plumbers are taking contracts for installing hot water plants, although they possess but the

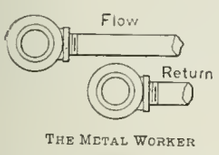

Fig. 1.—Side Feed to Branches.

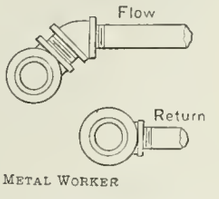

Fig. 2.—Angle Feed to Flow Branch.

Suggestions on Hot Water Piping.

first rudiments of the knowledge necessary to enable them to construct a plant that will work satisfactorily and give sufficient heat to warm a building thoroughly in zero weather.

There is no rule that will apply in all cases, giving the ratio to be used in figuring the surface necessary to properly heat a building, owing to the different range of temperature, the exposure and the various building materials used. The contractor has to rely in a great measure on his experience, or else have a competent heating engineer to figure the job for him.

There are, however, several things which a man should know himself if he intends to take heating contracts. He should know the proper pitch to give his pipes; the proper size pipes to use and the manner in which branches should be taken from the main supply pipe.

The main supply and return pipes of a hot water apparatus should have a pitch upward from the boiler of 1 inch in 10 feet.

The supply and return mains should have the same area as the total number of branches to be taken from

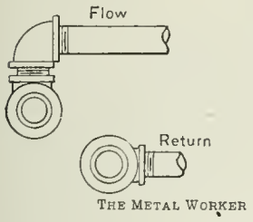

Fig. 3.—Top Feed to Flow Branch.

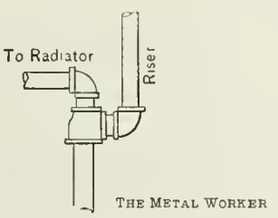

Fig. 4.—A Riser Branch.

them. For instances: There are four 1½-inch connections to be taken from the main supply pipe. The area of a 1½-inch pipe is 1.767. The area of four of these is 7.068, or the area of a 3-inch pipe. The main, therefore, where it leaves the boiler would be 3 inches, and would be reduced in size as each connection was taken off until it comes to the last, when it would be 1½ inches.

One of the main reasons why a hot water heating apparatus proves unsatisfactory is because the proper connections are not made at the branches from the main supply pipe. The sketches show how the branches to risers and radiators should be taken off the mains in different cases.

Fig. 1 shows the branch feed pipe taken from the side of the main supply pipe and the branch return pipe connected into the side of the main return pipe. This style of connection is seldom used except for connecting a riser to a single radiator on the upper floors, or to a second-story radiator in case the connection is taken from the main but a short distance from the boiler.

Fig. 2 shows the branch feed pipe taken from the main supply pipe on an angle of 45 degrees and the branch return pipe connected into the side of the main return pipe. This style of connection is used for connecting the branch to the first-floor radiator when such radiator is the first one supplied, being nearest the boiler. This connection is also used for connecting the branch to a riser that supplies two or more radiators on the upper floors.

Fig. 3 shows the branch feed pipe taken from the top of the main supply pipe and the branch return pipe connected into the side of the main return pipe. This connection is only used for connecting the branches to first-floor radiators.

It will be seen from the above that the radiators on the lower floors are to be more favored than others. Under no circumstances connect a first-floor radiator to a riser supplying radiators on the upper floors. First-floor radiators should always have a separate connection direct to the main, as the hot water has a tendency to cir-

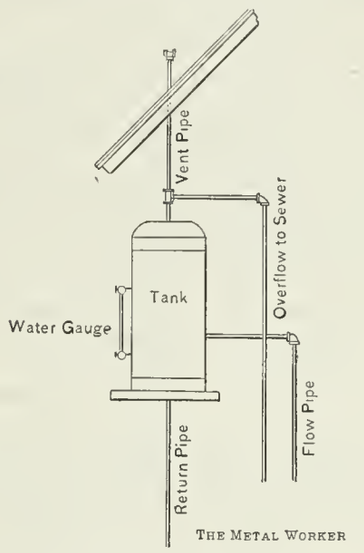

Fig. 5.—Expansion Tank Connections.

culate right past a first-floor radiator when it is fed from a riser supplying other radiators on the upper floors.

The method given in Fig. 4 is for connecting a radiator to a riser which supplies another radiator on the floor above.

It will be seen by Fig. 4 that the radiator on the lower floor has a direct connection, while the one on the upper floor is taken out of the side of the pipe supplying the second-floor radiator and runs up to the third floor.

The method of connecting an expansion tank to provide for a circulation in it to prevent freezing is shown in Fig. 5. The tank should be located above the highest radiator in the job.

Heating Trains by Steam.

Two students at the Massachusetts Institute of Technology are conducting experiments on the through trains of the Maine Central Railroad, between Bangor and Portland, to ascertain the most efficient way of heating a train in severe winter weather and of establishing a standard for the amount of steam used on different classes of trains. One of the students rides on the engine, in charge of a device for measuring all the steam that passes from the locomotive to the cars through the hose used for heating. The other student rides in the cars, with highly sensitive thermometers, from which he takes accurate readings every few minutes. Exhaustive observations are being made, and when finished the railroad officials and the instructors at the institute expect to possess much valuable data for the guidance of those who have charge of the valve controlling the steam for heating trains. It has already been discovered that a great amount of steam is wasted between the locomotive and the train. The observations are being made with different kinds of fuel, as well as with different characters of trains.

CLASSIFICATION AT THE LOUISIANA PURCHASE EXPOSITION.

The Classification Book for the Louisiana Purchase Exposition at St. Louis, in 1903, gives the following groups and classes of exhibits which will be interesting to readers of *The Metal Worker:*

Group 46 is devoted to plumbing and sanitary materials, as follows:

Class 270. Sanitary earthen ware: Bathing apparatus and attachments, lavatory fittings, laundry tubs, basins, cocks, draws, &c.; sewerage apparatus, plumbers' appliances.

Group 48 comprises apparatus and processes for heating and ventilation, as follows:

Class 283. Heating by steam, hot water, hot air and their combinations.

Class 284. Methods of conveying and distributing steam, hot water and hot air used separately or in combination.

Class 285. Natural ventilation; ventilation by exhaustion; ventilation by mechanical means and their combinations.

Class 286. Plans and models of buildings heated and ventilated; public buildings, factories, dwelling houses.

Class 287. Stoves and furnaces peculiar to the various systems of heating.

Class 288. Radiators of heat of all kinds and sizes. Steam or hot water boilers. Steam or hot water ranges. Hot air pipes. Hot air stoves.

Class 289. Ventilators and displacers of air. Up-draft ventilators.

Class 290. Methods for the direct renewal of air to warmed and ventilated apartments.

Class 291. Apparatus for household heating. Preparation and cooking of food. Stoves or chimneys, fixed or movable.

Class 292. Apparatus for heating by petroleum or gas.

Class 293. Steam cooking ranges. Kitchen ranges of all kinds, stoves used at the same time for cooking food and for warming apartments. Stoves adapted to certain special forms of cooking. Stoves and apparatus, fixed or movable, used for preparing food or beverages in large quantities.

Class 294. Ventilators operated by the wind or by difference of temperature.

Class 295. Sanitation and ventilation of kitchens and small living rooms.

Class 296. Accessories to heating and ventilation. Measuring and registering apparatus; thermometers, self registering thermometers, pyrometers, anemometers, manometers for measuring low gas pressures, and for indicating the level of water in pipes; appliances for measuring the flow of steam through pipes; registering apparatus of every kind.

Class 297. Thermostats; distributing and regulating apparatus; regulators of temperature; regulators of draft; regulators of pressure; automatic drip cocks and air cocks; cocks specially fitted for heating apparatus.

Class 298. Chimney fittings. Dampers for chimneys; closing of flues; openings for hot air and ventilation. Gratings and plates. Metallic casings for heating apparatus; special sheet iron, chimney pots.

Class 299. Fire place and chimney pottery. Stoves and chimneys in earthen ware. Ornaments. Earthen ware of every sort for the fire place. Refractory materials for hearths, hot air stoves, stoves and chimneys.

Class 300. Hearth furniture; fire lighters; ash sifters; utensils for cleaning and repairing; accessories.

The American Warming & Ventilating Company of Pittsburgh will apply for a charter on March 15. The incorporators are Henry L. Williams, Joseph E. McGinness, William W. Dobbins, Samuel Garrison and Daniel Ashworth. The company propose to make and erect warming and ventilating closet systems for buildings of every kind out of brick, stone, iron, steel and terra cotta. A complete plant is to be installed in the buildings they contract for, together with all automatic and mechanical appliances for its successful operation.

ASSOCIATION NEWS.

Minnesota Master Plumbers.

The eighth annual meeting of the Master Plumbers' Association of the State of Minnesota was held in Minneapolis last week with a large attendance and E. D. Hornbrook, president of the National Association of Master Plumbers and Vice-President Charles Polacheck as the guest of honor. Among the more important actions of the meeting were the indorsement of the Cleveland Resolutions and the reduction of the initiation fee. After electing the following officers, Winona was selected as the place for holding the next convention.

President, J. M. Jacobson, Minneapolis.
First Vice-President, W. E. Wicks, Duluth.
Second Vice-President, J. V. Cunningham, Winona.
Secretary, A. A. George, Minneapolis.
Treasurer, John MacQuillan, St. Paul.
Executive Committee: L. Neinaber, St. Paul; John L. Hague, Minneapolis, and the other officers.
Delegates to National Convention: J. M. Jacobsen, W. W. Hoopes and O. A. Blethen.
Delegates to Inter-State League: J. M. Jacobsen, J. P. Adamson and Allan Black.

The delegates were entertained with a vaudeville entertainment and a smoker by the local association.

Chattanooga Master Plumbers.

At the annual meeting of the Master Plumbers' Association of Chattanooga, Tenn., the following officers were elected for the ensuing year:

President, T. S. Wilcox.
Vice-President, J. D. Colter.
Secretary, Fred. Fox.
Treasurer, H. A. McQuade.

Master Plumbers' Mutual Protective Association.

The fourth annual meeting of the Master Plumbers' Mutual Protective Association of Baltimore, Md., was held recently, when the following officers were elected:

President, H. J. Neinhardt.
Vice-President, W. H. Schaefer.
Secretary, C. Wagner.
Financial Secretary, L. Lenderking.
Treasurer, C. Schuchard.

After the meeting a banquet, for which 40 covers were laid, was made a happy feature of the occasion, and the responses to the toasts were received with applause.

Connecticut Master Plumbers.

A meeting of the Executive Committee of the Connecticut State Association of Master Plumbers was held in Hartford on February 19, when arrangements were made for holding the annual convention in Bridgeport on May 14. Those present at the meeting were: President M. W. Manwaring of Bridgeport, First Vice-President C. E. Coe of New Haven, Second Vice-President Edward Mabl of Hartford, Treasurer James Donovan of Middletown, Secretary T. E. Logan of Bridgeport, Financial Secretary George S. Bull of Hartford, T. D. Barlow of Waterbury and F. F. Hitchcock of Woodbury.

Missouri Master Plumbers.

Eighty master plumbers from all parts of the State attended the eighth annual convention of the Missouri Master Plumbers Association, held at St. Joseph, Mo., on February 18 and 19. After discussion of the various matters brought before the convention and their satisfactory disposition, the following officers were elected:

President, S. H. Powers, St. Joseph.
First Vice-President, R. T. Connell, Kansas City.
Second Vice-President, J. J. Lawler, Springfield.
Treasurer, D. T. Atchison, St. Joseph.
Secretary, Wm. Schwer, St. Louis.
Executive Committee: J. W. Comerford, Joplin; E. D. Hornbrook, Kansas City; James P. Carroll, St. Louis; H. A. Jeffreys, Jefferson City, and the officers.

The following committees were also appointed:

Sanitary Committee: W. M. Marvin, Kansas City; W. M. Hale, St. Joseph; Thomas Armstrong, Springfield; Guy C. Coleman, Platte City; H. B. Schulte, Joplin.

Legislative Committee: John J. Foy, St. Louis; Claude L. S. Smith, Kansas City; John J. Lawler, Springfield; M. W. Jackson, St. Joseph; Jeremiah Sheehan, St. Louis.

Apprentice Committee: R. T. Connell, Kansas City; William Burke, St. Louis; F. A. Brandt, St. Louis; H. C. Tompkins, Springfield; P. L. Bristol, St. Joseph.

The delegates were given a party at the Tootle Theater by the local association.

West Hudson, N. J., Master Plumbers.

The master plumbers of Harrison and East Newark, N. J., have met and organized an association, electing the following officers:

President, Archie McArthur.
Corresponding Secretary, A. Metzger.
Financial Secretary, Arthur Danieke.
Treasurer, Robert Marshall.

THE P. AND S. S. LEAGUE.

On Monday night of last week the last regular series of the Plumbing and Steam Supply League Bowling Tournament was finished, the Ronalds & Johnson Company, Brooklyn, team winning two games, and scoring 849 in one game, the highest of the tournament. The Salesmen team was short two men and lost two games, while the C. S. Locke & Smith team broke even. On Friday, postponed and protested games brought out the teams of the Crane Company, Central Foundry Company and C. S. Locke & Smith, the Fadee & Co. team and the Ronalds & Johnson Company's, New York, team forfeiting at the conclusion. The teams of Behrer & Co., John Simmons Company and the Crane Company were tied for first place. The teams of F. N. Du Bois Company and Ronalds & Johnson Company, Brooklyn, tied for fourth place, while the Dimock & Fink Company team had the sixth place, with the teams of the Central Foundry Company, C. S. Locke & Smith and Ronalds & Johnson Company, New York, tied for seventh place.

STANDING OF THE TEAMS AT CLOSE OF TOURNAMENT.

Teams.	Won.	Lost.	Team score.	Individual score.	Name.
Crane Company	12	2	833	210	A. E. Good.
Behrer & Co	12	2	827	201	M. Behrer.
John Simmons Company	12	2	779	196	W. A. Presby.
Ronalds & Johnson Company, Brooklyn	11	3	849	198	W. T. Gilmour.
F. N. Du Bois & Co	11	3	776	212	E. E. Haff.
Dimock & Fink Company	8	6	772	194	F. G. Hogenaur.
C. S. Locke & Smith	7	7	728	193	C. A. Blanchard.
Ronalds & Johnson Company, New York	7	7	727	194	W. S. Gibbs.
Central Foundry Company	7	7	702	199	J. S. Dibley.
Salesmen	6	8	796	230	Henry Stein.
H. P. Read Lead Works	4	10	689	196	C. V. Driggs.
F. Adee & Co	2	12	695	175	A. B. Kolyer.
John A. Murray	2	12	677	189	G. W. Tilton.
E. F. Keating	2	12	675	185	C. J. McCarthy.
Thomas G. Knight	2	12	675	182	E. E. Benas.

On Thursday night of this week the teams met to settle the ties for the various prizes, with the following results, in the presence of representatives of all the other teams, and many men prominent in the trade:

THE PRIZE WINNING TEAMS.

First prize, $25, Behrer & Co.
Second prize, $20, Crane Company.
Third prize, $15, John Simmons Company.
Fourth prize, $12, Ronalds & Johnson Company, Brooklyn.
Fifth prize, $10, F. N. Du Bois Company.
Sixth prize, $7.50, Dimock & Fink Company.
Seventh prize, $5, C. S. Locke & Smith.

HIGH TEAM SCORE, $5 00.

Ronalds & Johnson Company, Brooklyn, 849.

INDIVIDUAL PRIZES.

First best average, $5, C. W. Grimshaw.
Second best average, $3, J. S. Dibley.
Third best average, $2, Rollin C. Wilson.

HIGH INDIVIDUAL SCORE, $3.00.

Henry Stein, 230.

GREATEST NUMBER OF SPARES, $5.00

E. E. Haff and A. E. Good.

The winners of the diamond cuff buttons donated by the *Plumber and Fitter* for the greatest improvement, and the gold mounted pearl opera glasses donated by W. S. Emery for the smallest percentage of breaks have not been determined.

In bowling off the ties, the team of John Simmons Company had scored 677, and were only beaten two pins by the Crane Company team, with 679, when the anchor, A. E. Good, scored 27 on a double header in the last frame. The Behrer family scored 692, and won first place. The Ronalds & Johnson Company, Brooklyn, team scored 826, and beat the F. N. Du Bois Company team for fourth place, while the C. S. Locke & Smith team scored 831, and secured the seventh prize. E. F. Ryder scored 223, and W. T. Gilmore 198 on the Ronalds & Johnson Company, Brooklyn, team, and captured the individual honors for the evening. The tournament is generally considered a very happy incident in the supply trade, and both President Haff and Secretary Wilson, who are entitled to the chief honors, are receiving congratulations.

PRESENTING THE PRIZES.

Arrangements are now being made for a dinner as a grand finale to the tournament, when some of the prominent men in the trade will present the prizes to the winners. In order that this dinner may be generally enjoyed by the trade, it is not intended to restrict it to the bowlers only. Other members of the trade can participate by arranging to procure dinner tickets, which will be sold for $1 by Secretary Rollin C. Wilson, 116 Nassau street, New York. The dinner will be served in the large dining room above the Monarch Alleys, at Twenty-sixth street and Sixth avenue, and the date will be announced when it is settled.

THE BUSINESS MEN'S CHAMPIONSHIP TOURNAMENT.

Arrangements have been completed for a competition between the different trades under the Business Men's Championship Tournament, which will be opened on March 10 at the Monarch Alleys, with a contest between teams from the Plumbing and Steam Supply League and the drug trade.

New York City Notes.

Water Commissioner Dougherty is making a strict investigation of the city water meters. He charges that many of them have been tampered with, so that they do not register properly, and that the plumbers often set them improperly so that only part of the water used goes through them. Instead of making charges against the plumbers, who are liable to lose their licenses should they tamper with meters. Mr. Dougherty might, with advantage, turn his attention to engineers and janitors, who are not above suspicion of doing such things.

* * *

John J. Tucker, a prominent builder and brother of Charles Tucker of 45 East Eleventh street, died last week.

* * *

Hugh McCormick died at his residence, 271 West 126th street, New York, on Tuesday, at the age of 76 years. He was one of the oldest members of the New York Master Plumbers' Association, and one of the charter members. He conducted a plumbing business at the above address for many years, though of late his son, James McCormick, took the active part. His funeral, which was held from St. Joseph's Church on Thursday, was attended by a number of members of the association and his friends in the trade.

Kearns Bros., Holyoke, Mass., plumbing and heating contractors, have just completed a new Pipe shop in the rear of their building, at the corner of Main and Spring streets. The building is 30 x 50 feet, and well equipped for this department of their work, their machinery cutting to 6-inch Pipe. The firm are busy with a large number of contracts, and within the last few weeks have installed about 25 new Heaters.

The Doran Light.

The Acorn Brass Works, 1523 South Jefferson street, Chicago, Ill., are sending to the trade a series of interesting pamphlets devoted to what they term the "Wonderful Doran Light." This light is said to have a brilliant illuminating power, and to embody the result of many years' experiments with hydro carbon lights. It is claimed to be softer, whiter, more diffusive and absolutely steady as compared with an electric arc light, without the glare peculiar to the arc light. A strong feature is that it is available for either buildings or street lights. The Doran lighting system is made in various capacities, from a 1-gallon lighting system to as large as may be required for lighting a group of buildings, or a number of lights on grounds. The catalogues show the different styles of lamps, some finished like a regular gas lamp, others inside a globe and the lights adapted for outdoor use, either with a large tank concealed in the base of a supporting base, or by means of a small tank or reservoir, made interchangeable, located at the top of a post. The catalogues present sectional illustrations, and give such description as makes the entire construction and operation readily understood. Some of the pamphlets are devoted to the answering of the questions that naturally would be raised by possible purchasers. They contain a variety of testimonial letters arranged to give information, and a long list of users in different parts of the country. The circulars also show the M. &. M. are portable lamps and the Acorn system light. The M. & M. light is said to have a 450 candle-power, and the Acorn system light can be regulated to furnish from 16 to 500 candle-power. In this lamp it is claimed that a gallon of gasoline will last 25 hours. With the budget of printed matter comes a little envelope showing the character of brass tubing used with the 1-gallon Doran lighting system.

Heating and Plumbing Notes.

The Royal Heating Company, 210 Mason street, San Francisco, Cal., are sending to prospective purchasers of heating apparatus in their vicinity a circular that is well calculated to attract the attention of buyers to the hot air furnace system, owing to the large and attractive illustration presented. They are also distributing a card, which is found to be the marriage certificate of a woman who desires that her husband shall enjoy life, inasmuch as she is enjoying life through the possession of a Royal Heater.

E. M. Craig, secretary of the Chicago Master Steam Fitters' Association, has been obliged to seek new quarters, owing to the destruction by fire of the Orpheon Building, in which the association offices were located. He has established an office for the present at 91 Clark street.

Louis Nado, Danielson, Conn., has the contract for plumbing two houses for George I. Eaton, in that city.

The Committee on City Property, at Providence, R. I., awarded the contract for heating the Chalkstone Avenue and the Ralph Street Schools to the Allen Fire Department Supply Company of that city.

Estimates are being made on the new building to be erected by the Eaton, Cole & Burnham Company, on Main street, Bridgeport, Conn. It will be 45 x 202 feet, three stories high, of brick, heavy mill construction, with Bullard's Plastic Cement roof. The first floor will be concreted, and an elevator will be installed. The building will be used as a machine shop.

The Standard Sanitary Mfg. Company, Pittsburgh, Pa., have declared a 7 per cent. dividend. The offices of secretary and treasurer have been combined and are filled by W. A. Myler, the former treasurer, J. W. Arrott having resigned.

The Louis Lipp Company will establish a new foundry at Fifth and Wayne streets, Cincinnati, Ohio. It will be a general jobbing foundry, operated by a corporation entirely distinct from the Louis Lipp Company, though the same interests will be largely in both. The company do their own foundry work in connection with the manufacture of Bathtubs, but when the new plant is finished this work will be done in the new plant, and the old location will be turned over to heavy castings entirely. Another cupola will be added, and the capacity largely increased. The name of the company will probably be the American Foundry Company, and it will be ready for operation about April 1.

The F. R. Dengel Mfg. Company, Milwaukee, Wis., have purchased the Plumbers' and Steam Fitters' Supply business of the Charles Winterfield Company and intend carrying a complete line of such goods.

G. G. Doyle & Co., Salt Lake City, Utah, have been awarded by the State Board of Corrections the contract for heating and plumbing the State Prison at their bid of $2349. The convicts at the prison will do the work.

A delegation of Baltimore, Md., master plumbers went to Annapolis on February 18 to urge the Governor to reappoint the present Board of Plumbing Commissioners. In the delegation were John Frainor, August Eidman, Arthur Slagle, Andrew Slagle, George W. Addison, Lloyd E. Mitchell, A. G. Alford and others. A delegation of journeymen plumbers recently went to Annapolis, also, to ask that one member of the board be appointed from among the journeymen plumbers.

J. R. Klinefelter, Baltimore, Md., has invented an apparatus for ventilating tunnels.

Contracts have been awarded for the construction of the proposed new water works for the Groton Water Company, Groton, Conn. J. J. Ryan of New London will build the dam, Taylor & Tylee of Boston will lay the pipe, the Stillwell-Bierce & Smith-Vaile Company, Dayton, Ohio, will put in the plumbing plant and gasoline engine; Tipett & Wood, Phillipsburg, N. J., will erect the standpipe, and the Warren Foundry & Machine Company of the same place will furnish the Pipe. Daboll & Crandall of New London, Conn., are the engineers.

The Hopson & Chapin Mfg. Company, New London, Conn., are furnishing the Boilers, and Newman & Cronin are doing the plumbing in three fine residences in that city.

Peck Bros., Montpelier, Vt., have the contract for installing the steam heating system in a four-story brick block that is being erected by Dr. W. B. Mayo, at Northville, in which they will use two Magee Sectional Heaters and about 2000 feet of direct radiation.

The journeymen steam fitters of Massachusetts are endeavoring to have the Legislature of that State pass a law providing for the examination and licensing of steam fitters.

T. C. Fife of Reading, Mass., has secured from the town of Weymouth a contract for the plumbing in a new brick school house there.

The Board of Health of Poughkeepsie, N. Y., have appointed Edwin L. Taylor as plumbing inspector.

A slight fire visited the plumbing establishment of Alexander Walther, 87 Westerlo street, Albany, N. Y., last week.

William R. Dougherty, 340 South Twenty-first street, Philadelphia, has secured the contract for the plumbing system in the Foulke & Long Institute, at Langhorn avenue, in that city.

As a result of the plumbing strike in Memphis, Tenn., some out of town plumbers, who were brought in to work for the master plumbers, have been assaulted. The union officials claim that they are not responsible and discountenance such actions.

The Barlow Bros. Company, Waterbury, Conn., have been given the contract for the plumbing and cornice work on the new parochial school which is being erected by the Church of the Immaculate Conception, in that city.

Plumbing Inspector E. H. Donohue of Peoria, Ill., is strictly enforcing the law requiring plumbers to take out permits for their work, in order to provide against bad plumbing in that city.

James A. Trane, 201-203 South Fifth street, La Crosse, Wis., is sending to the trade a pamphlet devoted to the Trane vacuum system of steam heating. The

catalogue shows a one-pipe system of steam piping and the method of connecting the Trane vacuum apparatus with it. The catalogue is accompanied by a report of an efficiency test.

P. A. Canfield, general manager of the Canfield Supply Company, Rondout, N. Y., and president of the National Bank of Rondout, is on an extended trip to Cuba and other Southern ports.

Henry Dunn is to open a plumbing shop at Presque Isle, Maine.

The People's Heating Company have been incorporated at Kittery, Maine, for manufacturing, leasing and renting all kinds of Heating Apparatus. The capital of the concern is $200,000 and the officers are: President, Charles C. Smith, and treasurer, W. P. Huelin.

The Lambert's Point Roofing & Plumbing Company have been incorporated at Lambert's Point, Va., with James E. Fentress as general manager; J. Alex. Jones of Norfolk, secretary and treasurer, and Jas. E. Fentress, J. Alex. Jones, J. T. Wilson, Edward Kibler and F. C. Miller, directors. The capital stock of the company will not be less than $1000 nor more than $5000, divided in shares of $100 each. The concern will do roofing and guttering of all kinds, and will deal in all kinds of material necessary to the roofing of houses and of apparatus and material for all kinds of plumbing, steam, gas and electric fittings.

The Gilmore Plumbing Company have been incorporated by U. L. Gilmore, J. H. Gilmore and D. S. Gilmore, with a capital stock of $5000, to operate in Colorado Springs, Col.

The sale of the valuable plant of the McIlwaine-Richards Company, dealers in Plumbers' and Steam Fitters' Supplies, at 114 and 116 West Maryland street, Indianapolis, Ind., is said to be under negotiation. As reported in the *Sentinel* of that city, Eastern parties have united with local capital to purchase the business. The firm have for a long time maintained a plant at Noblesville, and if the sale is completed the McIlwaine-Richards Company will concentrate their business at that point.

L. L. Bassett, New Haven, Conn., is sinking two artesian wells for the John T. Doyle Company on Franklin street, and is finishing up six wells for the Chatfield Paper Company.

The School House Commissioners of Boston, Mass., will receive bids until March 5 for plumbing the Everett School House in that city.

Constructing Quartermaster Captain G. O. Cress will receive bids until March 20, at Fort Riley, Kan., for heating and plumbing one artillery barracks and one double cavalry barracks at that place.

The 1902 catalogue of the Buffalo Meter Company, Buffalo, N. Y., describes their very complete line of Meters for measuring water, and calls special attention to their improved Niagara Meter for general house use.

The Burley Heater Company, Tyrone, Pa., general founders and manufacturers of the Burley Adjustable Heater for steam or hot water, report a heavy demand for their Steam and Hot Water Boilers. They are making shipments as far West as Wisconsin and as far South as North Carolina. They are also very busy in the foundry department, making large quantities of Gray Iron Castings for the United States Government and other parties.

Charles A. Jackson & Co., 274 Bank street, Waterbury, Conn., are making a specialty of Marble for mantels, stalls, lavatories, &c.; also Tiling and Slate for heating and plumbing work.

Quartermaster Thomas H. Slavens, 209 Thomas street, Newport, R. I., will receive bids until March 26 for heating and plumbing two sets of officers' quarters at Fort Adams.

Two high pressure Boilers in one setting and a complete power, heating and lighting plant, to cost $38,000, will be installed in the big office building of the Pittsburgh Plate Glass Company at the northeast corner of Eleventh and Arch streets, Philadelphia, Pa., by the Francis Brothers & Jellett Company, Incorporated. The work will be begun on March 1, and be completed as rapidly as possible. The same contractors will install a hot water heating system in Dr. R. W. Deaver's residence, 6105 Germantown avenue, the cost to be about $1200.

The Board of Trustees of the Central Indiana Hospital for the Insane will receive bids until March 5, at the office of A. Scherrer, Indianapolis, Ind., for the electric light fixtures for the hospital for sick patients.

The plumbers of Memphis, Tenn., have been enjoying the experience of taking an examination before an examining board of plumbers to secure certificates of competency, in order to take out a license.

James J. Walters has resigned his position with the Judson A. Goodrich Company of New York City.

The Central Supply Association, composed of the manufacturers and jobbers of Plumbers' Supplies in the Central West, held their regular quarterly meeting on Tuesday of this week at the Hollenden Hotel, Cleveland, Ohio. Some important topics were discussed at this meeting.

New Firms and Changes.

Charles E. White will open a plumbing shop and Stove store, at Wallkill, N. Y.

The Allegheny Plumbing Company have been incorporated at Allegheny, Pa., with a capital stock of $5000. The directors are Harry H. Short and Charles D. Laughlin of Allegheny, Sherman Wolfe of Bellevue and Edward A. Hess of Avalon, Pa.

Frank D. Pierce has purchased the interest of J. Weekes in the Plumbers', Steam Fitters' and Tinners' Supply house of the Hunting-Weekes Company, at Watertown, N. Y.

The Mason Heater Company of Bellaire, Ohio, have been incorporated with a capital of $100,000, to manufacture and sell Heating Apparatus.

The Charles Polacheck Company have been incorporated at Milwaukee, Wis., by Charles Polacheck, Joseph Polacheck and Arthur Polacheck, with a capital of $50,000, to deal in Plumbing and Electric Supplies.

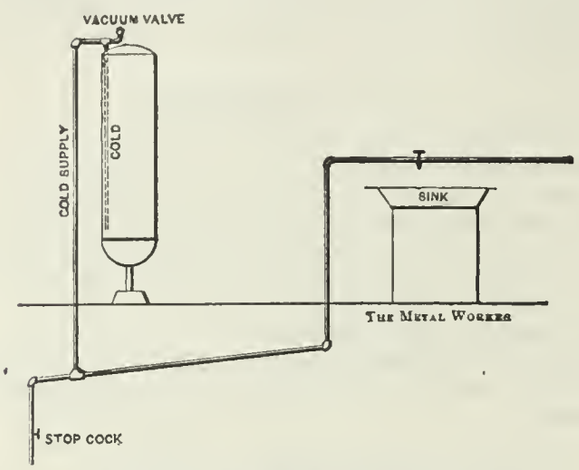
The Sterling Automatic Instantaneous Water Heating Company of Allegheny, Pa., have been chartered with a capital of $5000. The incorporators are Dr. A. J. Boucek, Charles A. Boucek, James Tracey, William A. Bollinger and John Foerster. Dr. Boucek will be president, W. T. Sigmund, secretary, and William Z. Moller, treasurer. The company will manufacture Gas Supplies, principally a new Automatic Valve. A plant is to be erected in Allegheny. No site has yet been selected, but options on several properties have been taken. The capital of the company is soon to be increased to $20,000. The new concern expect to be ready for operation by April.

G. W. Garner & Co. have succeeded G. W. Garner in the hardware and plumbing business in Winterset, Iowa, J. H. Stone having bought a half interest in the concern.

White & Blakeslee are a new firm, composed of J. B. White and William A. Blakeslee, at Springfield, Mass., who have been formed to manufacture the Twentieth Century Water Heater for heating rooms and for heating water for domestic use, &c.

New Jersey Plumbing Specialty Company, 106 Adams street, Hoboken, N. J., have been incorporated to manufacture Plumbing Specialties, with a capital of $25,000, by Almond D. F. Adams, Austin Adams, Wm. M. F. Adams.

The blast furnace employees in the Mahoning and Shenango valleys have decided to ask for an eight-hour day, to become operative May 1. At present the men work on 12-hour shifts. Laborers who are employed ten hours will make a separate demand. It is said that some of the blast furnace operators are favorable to an eight-hour day, providing it is made universal at all the blast furnaces in the two valleys. It means, of course, a higher labor cost in the manufacture of pig iron.



THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

WHERE SHOULD VACUUM VALVE BE PLACED?

From F. E. J., York Village, Maine.—Will *The Metal Worker* tell me the proper place to connect a vacuum valve on a kitchen boiler? I have always connected them at the top of the boiler, where the supply pipe enters, as shown in the sketch herewith. I have been told by an experienced plumber that it was not the proper place, and that it should be placed on the cold water pipe over the kitchen sink, between the bibs, or in the basement just above the stop cock. He further claims

Where Should Vacuum Valve Be Placed?

that if there is no hole punched in the inner tube near the top of the boiler, he can prevent the siphonic action from emptying the boiler through the supply pipe by simply opening the hot water bib at the kitchen sink. I fail to agree with him, and would like to have *The Metal Worker* and its readers give their views on these questions.

Note.—We hope our readers will discuss this question, which we leave to them.

A HOT WATER RULE.

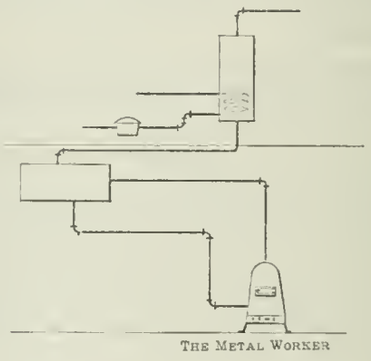
From L. & C., Jackson, Mich.—Will you please be so kind as to give us the most simple and practical rule to apply on hot water heating systems, in determining the amount of radiation to be used. The conditions which we wish to consider are: The temperature of the water at the boiler at 160 degrees, and the outside temperature at zero, with an inside temperature of 70 degrees in buildings where there is no solid basement under the structure, and where the outside walls are thin. We mean by this that they are not double boarded. We would also like to know the difference for figuring between upstairs and first-floor rooms. We have always had a way of our own, but would like a better way, and would thank you and the readers of *The Metal Worker* in advance for any rules that you may bring to our attention.

Note.—We hope that the request of this correspondent will not be passed over by our readers who are doing hot water heating. In the meantime we reprint the following, taken from that part of the book called "Furnace Heating" which treats of combination hot air and hot water heating:

If desired the radiating surface may be based directly on the loss of heat through walls, windows, floors and ceilings. A convenient approximate method is to consider 4 square feet of ordinary wall equivalent in heat transmitting to 1 square foot of glass; then reduce the exposure of the room to equivalent glass surface by adding to the window area one-quarter the area of the outside walls. Outside doors are to be estimated as equivalent to one-half their area in glass. If the space below or above the room is not heated add to the equivalent glass surface one-twentieth of the area of the floor or ceiling. The total equivalent glass surface thus obtained divided by 1.8 will be the amount of radiation required with the open tank system. For the pressure system divide by 2.4.

To compensate for the increased loss of heat due to winds add the following percentages:

Fifteen to 20 per cent. for rooms having a northerly or westerly exposure.



Ten to 15 per cent. for rooms having an easterly or northeasterly exposure.

For rooms with but one exposure, besides the correction for winds, add 10 to 15 per cent. to the loss of heat by transmission, to allow for the effect of the greater cubic contents as compared with the exposure than in rooms having two exposed walls. Otherwise such rooms will be slow in warming.

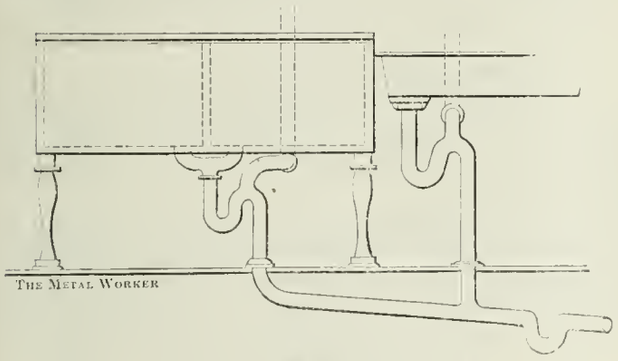
Owing to the character of the walls mentioned it may be better to consider 3 square feet of wall surface as equal in cooling effect to 1 square foot of glass. If the temperature in the upper rooms is not to be kept as high as in the lower living rooms, 10 per cent. less radiation may be used.

A PROBLEM IN BOILER CONNECTIONS

From B. H. C., Greenville, S. C.—We have a customer who has two 200-gallon hot water storage tanks placed as shown in the accompanying sketch. The water in the upper one is heated by means of a steam coil, and in the lower one by circulating the water through a small water heater. Our customer wants to have these two tanks connected, so that he can heat the water in both with one heating apparatus, and still have both heaters to use at will. We have advised him that this could not be done with the present arrangement of boilers and piping, because, when using the steam coil for heating the water in the upper boiler, there would be no way to make the hot water circulate into the lower boiler. Thinking that perhaps we might be in error, we shall be glad to have from *The Metal Worker* and its readers any suggestions that would apply to this case. We would also like to know the best method of connecting the two boilers to make the most hot water at one general outlet, when both boilers are in use, and the place where valves should be placed between the two boilers, when one boil-

A Problem In Boiler Connections.

er is not in use. In all our heating problems we have never had one exactly like this, and would be glad if some of the readers of *The Metal Worker* would present their solution of this one.



MEASURING WATER SUPPLY.

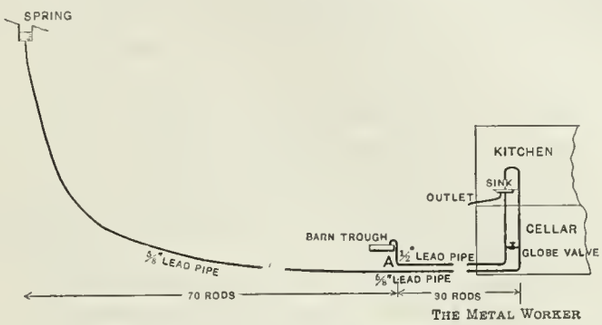
From A. E. O'T., Clinton, Mass.—The following questions were recently put to the several witnesses at a trial in court, a number of whom were mechanics representing the machinist, plumbing and tinsmith trades, besides three or four architects, and none of them were sure of their answers. The trial was for damages owing to the loss of service from springs, caused by a sewer being put through a piece of land. One man claimed that his spring would furnish water enough to fill a 1-inch pipe and keep it running. The most fall he could get from the spring was 6 feet, and the longest drive pipe from the spring he could run and keep on his own land was 25 feet. Another complainant stated that he could

have 50 feet of drive pipe with 8 feet fall, and his spring would keep a 1½-inch pipe full of water all the time. Another complainant stated that his spring would keep a 2-inch pipe full of water all the time with a fall of 10 feet and a drive pipe of 100 feet. The question was, how much water would each one of these springs furnish in 24 hours, and what was the value of the springs, provided hydraulic rams were used? The water was valued at 20 cents per 1000 gallons. In the first instance a No. 3 ram was considered, and it would have to lift the water 25 feet. In the second and third instances a No. 5 ram was considered, and it would have to lift the water respectively 50 and 80 feet. The owners of the springs had never measured their capacity before the sewer was put in, but they had old pipes of different sizes laid from the springs to tubs and formed their judgment as to the capacity of the springs by the amount of time that was required to fill these tubs. Some of the readers of *The Metal Worker* may have some simple rules for finding out the amount of water that will flow through different sized pipes at different elevations and of different lengths, also some actual experience of the amount of water different sizes of rams will furnish. I do not care for the information given in catalogues, but would like to get the practical experience of the readers of *The Metal Worker* on the questions presented.

A QUESTION IN WASH TRAY TRAPPING.

From O. F., Seaford, N. Y.—I have seen the inquiry of "M. B." in *The Metal Worker* of February 8 and agree with *The Metal Worker's* comment upon it. If I were to

A Question In Wash Tray Trapping.



trap the fixtures as shown in Fig. 2, I would add a running trap, as shown in the sketch herewith.

Note.—We regret that our correspondent did not explain why he adds the running trap. As the fixtures are both separately protected by traps and a ventilating system, it would seem that a running trap would be entirely unnecessary.

WANTS TO AVOID WATER WASTE.

From I. Q. R., Cincinnatus, N. Y.—I desire to avoid the waste of water in the water supply system illustrated and described herewith. Three years ago I ran a ⅝-inch lead pipe from a spring to a house, and from the house, after running up to a point higher than the fixtures, I carried a smaller pipe back to a trough at the barn. This was to allow any surplus of water to run into the watering trough continuously for the use of the stock. In the cellar, a connection between the two pipes was made, so that the water could be turned on full head to the barn, in case of necessity. The present piping is unsatisfactory, from the fact that the return pipe from the house to the barn is smaller than the main supply pipe; consequently the water backs up at the house and causes trouble by overflowing in the winter and freezing in the kitchen. The spring is several feet higher than the house, and the outlet giving a good head, there is no trouble about the fall or flow of water.

What I desire to know is this: If I dig down to the pipes at the point A and cut off both pipes, connecting the ⅝-inch main pipe to ½-inch pipe, so that the supply would run from the ⅝-inch pipe through the ½-inch pipe to the house and then return through the ⅝-inch pipe to the barn, where it would connect with the short piece of ½-inch pipe which runs up from the barn trough, would I overcome the trouble? Will the force from the ⅝-inch pipe from the spring drive the water through the ½-inch pipe to the house faster than the ⅝-inch pipe from the house to the watering trough will carry it away? The object of the return pipe to the barn is to take all of the extra water to the barn automatical-

Wants To Avoid Water Waste.

ly and have no excess at the house. Of course, to change the pipes at A would necessarily cause a change in the piping and globe valve in the cellar. Any suggestion of a method by which the pipe will not have to be dug up between the house and barn and whereby all the water that is not needed at the house will be discharged at the barn will be thankfully received.

Note.—We shall be glad if our readers will give their views on this subject. In the meantime we would suggest that if the proposed changes are made the ½-inch pipe leading up from the ⅝-inch supply pipe to the barn trough should be removed and replaced with ⅝-inch pipe.

CONNECTING 45-DEGREE ELLS.

From O. S.—To settle an argument, will *The Metal Worker* inform us of the correct way to take the measurements for a pipe to connect two 45-degree ells? One party favors what is called the Philadelphia Gas Company way, which is to measure the distance of the offset on a right angle from center to center and add one-third. The Buffalo man's way is to measure in the same way and add five-twelfths of the length to the length.

Answer.—Of the two methods the last is practically correct, and is frequently used. The correct method is to multiply the length of the offset by 1.414, which gives a slightly different result that would only be of importance in case of a long offset. To reduce 1 5-12 to a decimal would give 1.416 2-3. To reduce 1 1-3 to a decimal would give 1.333 1-3, which shows which of the two methods is nearer correct. In any case, the measurements should be from center to center and allowance must be made for the fittings.

WANTS TO KEEP ROOF COOL.

From W. W., New York.—What is the best way to keep a flat roof, covered with tin, cool in the summer time, so as to reduce, so far as practicable, the heat in the top floor apartments and so as not to be injurious in the winter?

POLISHING PLATE GLASS WINDOWS.

From Reader, Missouri.—I should be glad if any of the readers of *The Metal Worker* could tell me through the Letter Box the best method for polishing plate glass windows.

HEATING A BAY WINDOW.

From W. W., New York.—When a bay window faces the prevailing winds, a large amount of cold air and cold drafts enter the house. Would it be advisable to make a branch run from the cold air box to the foot of the window at this point, particularly in windy weather?

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is about ¾c. higher, with light demand.

Copper is dull and slightly lower.

Pig Lead is firm and fairly active.

Spelter has stiffened about ⅛c., but is quiet.

Antimony is unchanged.

Nickel is in good demand at former prices.

Aluminum is active and without change.

Tin Plates are firm and moderately active.

Sheets are very strong and demand urgent, on prospect of scarcity.

Sheet Copper is in good demand, and firm in price.

Scrap Iron is higher in price, and in large demand.

Old Brass and Copper are moving freely, and are firm in price.

Foundry Iron is very strong, with high premiums for early deliveries.

Hardware is moving actively, and prices, as a whole, show strength and steadiness.

House Furnishing Goods are in excellent demand, and prices firm in all directions.

Plumbers' Earthen Ware has been advanced 5 per cent.

Cast Iron Soil Pipe and Fittings have been marked up 10 per cent. in price.

Wrought Iron Pipe is likely to advance.

Lead Traps are 10 per cent. higher.

Solder rules about ½c. higher.

Wire Nails are unchanged.

Cut Nails are firm and in moderate demand.

Window Glass is still unsettled.

White Lead is firm and in fair demand.

Linseed Oil is firm and quiet.

Spirits Turpentine rules steady and quiet.

Old Rubber is quiet, except Rubber Shoes, which have advanced ¼c.

Manila Rope was advanced ½c. a lb.

METAL MARKET.

NEW YORK, February 28, 1902.

Pig Tin.—Current business in Tin is still very small. Consumers seem to be well supplied, and only small orders are coming forward. Since our last report prices here have advanced, notwithstanding a downward reaction in the London market. That market, however, was reported firm and higher at the close. Jobbers' quotations for small lots of Straits Pig are about ¾c. above those quoted in our last report. The present price is about 26½c. to 27c. per lb. It is said that spot Tin in London is in the hands of one party. These interests are said to have formed a syndicate with another clique, who are buying futures, and between them they have inaugurated a movement for a rise, with the hope that America will be forced in to help them out. It is not believed here, however, that any such necessity will arise, as large consumers are well supplied, having bought shipments at low prices. Receipts for the month to date have amounted to 2265 tons.

Copper.—The Copper market is still very quiet, with prices unchanged, although some weakness appeared late in the week in sympathy with a downward movement in the London market. Lake ingot in small lots rules at about 13¼c. to 13½c. per lb., and Casting Copper at about 13¼c. Exports are going on at a great rate, and have amounted thus far this month to about 12,000 tons. This movement is expected to continue for some time, as the price of Copper in London has held at a relatively high figure.

Sheet Copper.—The demand for Sheet Copper keeps up in good volume and comes from all classes of consumers. Prices rule firm on the basis of 18c. per lb. from store.

Pig Lead.—There is nothing of interest in this market, with the exception of the fact that it is now impossible to obtain Soft Missouri for spot or nearby delivery. Prices are firm, and the demand is referred to as fairly large. Jobbers quote American Pig in small lots at 4.45c. to 4½c. per lb. St. Louis advices report that a considerably better feeling exists in the Pig Lead market in that quarter. Transactions have been on a much broader and heavier scale since our last report.

Spelter.—Owing to the operations of the speculative element in the West the price of Spelter here has advanced during the week. Retail prices are about ⅛c. higher, good Western brands in small lots being quoted at 4.60c. to 4.70c. per lb. The trade, however, is quiet, transactions being on a very moderate scale. St. Louis advices are to the effect that a much better demand for Spelter has shown itself in that market, and, owing to the limited stock at the smelters, the price has improved materially.

Sheet Zinc.—The demand for Sheet Zinc is about of average volume. Jobbers quote 600-lb. cask lots at 6¾c., and smaller quantites at 7¼c. per lb.

Antimony.—This metal is unchanged. Hallett's is quoted at 8⅜c. to 8¾c. per lb. in small lots; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c. per lb.

Nickel.—The market is unchanged, small lots being quoted at about 55c. to 60c. per lb.

Aluminum.—There is a good demand for Aluminum in all its forms, and prices remain at the level they have held for some time past. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—Nothing new has developed in the Tin Plate situation. Shipments are being made in large volume from the mills, but almost all of these are in the nature of deliveries on old contracts. New business is said to be of moderate proportions. The canners, some of whom were badly caught last year by the failure of crops, seem to be nervous this season about contracting for much stock ahead, although this is the time of the year in which they have been accustomed to place their contracts for their season's supplies. It is said that a number of the canners have not yet placed their contracts for Plates. Considering the fact that the mills are all behind in their deliveries, particularly on Coke Plates, it would seem that some of these consumers may find themselves in an uncomfortable position later on, should the crops promise to be of even average size, for they will then all be coming into the market with a rush, and will find that the mills are unable to supply them with spot deliveries at any price. The retail demand for Tin Plates in this section is of fair volume for the season, and prices, as a whole, are well maintained, although some instances of cutting are mentioned. Stocks in jobbers' hands are by no means heavy; in fact, there is still a decided scarcity of some sizes and gauges of Plates. American Bessemer Coke Plates, IC, 14 x 20, in small lots, delivered at New York and corresponding points, are selling at $4.85 to $5 per box. The Welsh Tin Plate market appears to be very strong. Another advance of three pence per box took place this week, making the base quotation 13 shillings 9 pence per box, f.o.b. Swansea.

Sheets.—The demand for Sheets is still very urgent and the mills have all they can do to meet it. Prospects appear to indicate a considerable shortage during the next few months, as the makers have great difficulty in getting Sheet Bars, the scarcity of which seems likely to continue. In view of this fact the mills do not seem anxious for large orders at the present time. It is said that the independent Sheet mills have made arrangements to import Steel from Europe, and have sent a

commissioner over for that purpose. A number of these new concerns are said to have already defaulted upon contracts received by them when they started into operation a few weeks back. The trade is looking for quite a marked scarcity in Sheets along about April or May, when the demand is usually very heavy. Some large orders for Galvanized Sheets have recently been placed, and the market on these goods, as well as on Black Sheets, is very firm. No. 27 One Pass Cold Rolled Soft Steel Sheets are quoted in New York at 3.9c. to 4c., and Galvanized Sheets at 67½ and 5 per cent. to 70 per cent. off the list.

Chicago advices are as follows: An excellent demand is noted for both Black and Galvanized Sheets, and difficulty is now encountered in endeavoring to find a mill which is not sold considerably ahead. Jobbers quote small lots at 3.35c. to 3.45c. for No. 27 Black and 70 and 5 to 70 and 7½ on Galvanized. It is expected that jobbers' prices will soon be advanced, as they are unremunerative.

Old Metals.—Demand for Scrap Iron exceeds the supply. Prices are higher and very strong. Old Brass and Copper are in good demand also. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10¾c.
Light and Tinned Copper	per lb. 9 c.
Heavy Brass	per lb. 8¾c.
Light Brass	per lb. 6¼c.
Lead	per lb. 3⅝c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 3 c.
Pure Aluminum, Sheet	per lb. 25c.
Cast aluminum	per lb. 20c.
No. 1 Pewter	per lb. 15¾c.
No. 2 Pewter	per lb. 8 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.50 to 14.00
Heavy Cast Scrap, per gross ton	12.50 to 13.00
Stove Plate Scrap, per gross ton	9.50 to 10.00
Burnt Iron, per gross ton	7.00 to 7.50

THE PIG IRON MARKET.

New York.—The Iron market has quieted down somewhat, an increasing number of foundries having covered for the second half. There is some inquiry for nearby delivery, some of the furnaces having evidently oversold themselves. We quote for Northern Irons: No. 1, $18 to $18.50; No. 2 X, $17 to $17.75; No. 2 Plain, $16.75 to $17; Tennessee and Alabama brands, No. 1 Foundry, $16.50 to $17; No. 2 Foundry, $16 to $16.75; No. 1 Soft, $16.50 to $17; No. 2 Soft, $16 to $16.50; No. 3 Foundry, $15.50 to $15.75; No. 4 Foundry, $15 to $15.50.

Chicago.—Another week of heavy tonnage has been experienced. Certain large consumers are purchasing all the spot Iron they can secure, taking almost any quality. This is caused by the inability of some of the furnacemen to fill contracts, owing to the banking of furnaces for lack of Coke. The high prices now ruling are having some effect in chilling the ardor of prospective buyers, but there are enough others who must have Iron to make the new rates effective. Large producers of Pig Iron are endeavoring to allay the apprehension of buyers relative to the supply during the last half of the year. It is claimed that a considerable furnace capacity can then be diverted from Bessemer to Foundry Iron, which will enable the market to be supplied. We quote as follows:

Lake Superior Charcoal	$20.50 to $21.50
Local Coke Foundry, No. 1	17.50 to 18.00
Local Coke Foundry, No. 2	17.00 to 17.50
Local Coke Foundry, No. 3	16.50 to 17.00
Local Scotch, No. 1	17.50 to 18.00
Ohio Strong Softeners, No. 1	19.50 to 20.00
Southern Silvery, according to Silicon.	16.90 to 17.15
Southern Coke, No. 1	16.40 to 16.65
Southern Coke, No. 2	15.65 to 15.90
Southern Coke, No. 3	15.15 to 15.40
Southern Coke, No. 1 Soft	16.40 to 16.65
Southern Coke, No. 2 Soft	15.65 to 15.90

Philadelphia.—It is hardly possible that a large volume of business has been done, simply because there was so little Iron to sell. Quotations are practically of no use at all, because, in most cases, when a price is named it is immediately followed by the remark, "But we have no Iron to offer." In other cases the question and answer is about as follows: "Yes, we will sell you some Iron at $16.50 for No. 2 X Foundry, but we cannot guarantee deliveries." It would seem, therefore, that quotations such as these are meaningless, but when a buyer says he must have Iron, and have it quick, it becomes quite another matter, and prices with guarantee of shipment covering, say, 60 to 90 days, are from $18 to $18.50; that is to say, $1.50 to $2 beyond quotations, which are practically without any guarantees at all. Sales, therefore, are gradually narrowing down to a point which means prompt deliveries. The extreme range of quotations may be given as folows for Philadelphia and nearby deliveries, subject to conditions as above mentioned:

	Deliveries to July.	Deliveries July to December.
No. 1 X Foundry	$19.00 to $19.50	$18.00 to $18.50
No. 2 X Foundry	17.75 to 18.50	16.50 to 17.00
No. 2 Plain	17.00 to 17.50	16.00 to 16.50

Pittsburgh.—The Coke situation does not show much betterment, and blast furnaces are still hampered a good deal in operations on this account. The chief trouble seems to be lack of motive power and yards, and it will probably be a long time before there is permanent improvement. Buyers of Pig Iron seem to be scared as to supply, and are offering high prices for Iron for the second quarter and through the last half. Consumers of Foundry Iron are buying heavily through the second half and for the third quarter and Standard No. 2 Foundry has sold as high as $17.25, at furnace.

Cincinnati.—There has been quite a large volume of business in the Pig Iron market last week. The great bulk of tonnage was for delivery during the last half of the year. There has been and still is a strenuous effort on the part of some sellers to put prices above the present level, but so far as deliveries from July on are concerned their efforts have not been altogether successful. For delivery up to July there can hardly be said to be a regular quotation, and prices on what little there is to be had range up to $1 per ton higher than the minimum figures given herewith. The situation is generally a pleasant one, and the market is undoubtedly as strong as it has been. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$15.25 to $15.75
Southern Coke, No. 2	14.75 to 15.25
Southern Coke, No. 3	14.25 to 14.75
Southern Coke, No. 4	13.75 to 14.25
Southern Coke, No. 1 Soft	15.25 to 15.75
Southern Coke, No. 2 Soft	14.75 to 15.25
Southern Coke, Gray Forge	13.75 to 14.25
Southern Coke, Mottled	13.75 to 14.25
Ohio Silvery, No. 1	17.75 to 18.25
Ohio Silvery, No. 2	17.25 to 17.75
Lake Superior Coke, No. 1	18.10 to 18.35
Lake Superior Coke, No. 2	17.60 to 17.85
Lake Superior Coke, No. 3	16.35 to 16.85

St. Louis.—A very large volume of sales, including some heavy individual requirements, can be recorded the past week in the Pig Iron market. The bulk of the business was for the last half of the year. As we have pointed out before, it looks as if the larger buyers at this center were pretty well covered for the present. Premiums as high as $1 per ton are being offered for material for immediate delivery, but these offers are generally for small lots and in the majority of cases have been met. The demand included Iron of all grades. Prices are very firm and we quote for cash, f.o.b. St. Louis, as follows:

Southern, No. 1 Foundry	$15.75 to $16.00
Southern, No. 2 Foundry	15.25 to 15.50
Southern, No. 3 Foundry	14.75 to 15.00
Southern, No. 4 Foundry	14.25 to 14.50

CHICAGO REPORT.

Scrap Iron and Steel.—All kinds of Scrap are in active demand and prices are strong. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	13.00 to 13.50
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	7.00 to 8.00
Sheet Iron and Hoops	8.00 to 8.50
Plow Steel	11.00 to 11.50
Breaking Stock	.... to 11.00
No. 2, such as Shovels, Hoes, &c	7.00 to 7.50
Old Boilers—whole (Iron)	9.00 to 9.50
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	6.50 to 7.00
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—Consumers would buy freely, but find stocks small. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	9⅛c.
Copper Clips	10 c.
Red Brass	10½c.
Yellow Brass	8 c.
Red Brass Borings	9 c.
Yellow Brass Borings	7¼c.
Light Brass	6 c.
Pipe Lead	3.50c.
Tea Lead	3.25c.
Zinc	2.90c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.
Aluminum	20 c.

Old Rubber.—A sudden demand has sprung up for Rubber Shoes, which has stiffened prices, but they are not expected to hold, as general trade is quiet. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6.75 to 7c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6½c.
Black Rubber	....	4 c.
White Rubber	....	8 c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—Business is fair but not so active, owing to more moderate weather. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE HARDWARE TRADE.

The severe weather which has prevailed so widely through the country during the past week or ten days has put, for the time being, something of a damper on the trade, but notwithstanding these influences the volume of current business has been large. The salesmen of the jobbers visiting the smaller houses report generally an excellent feeling and are sending in well assorted orders. Merchants generally are buying with a good deal of freedom, anticipating a good business during the spring and summer. There is little apprehension of an early weakening in the market, but at the same time the anticipation of higher prices is having little influence in enlarging orders. Manufacturers are also busy soliciting orders, except the comparatively small number whose production is disposed of for the season. Prices generally are steady and firm. The strength of the Iron market is being felt along almost the entire line of manufactured products. The business of the country moves along in excellent volume and manufacturers and merchants are for the most part making money. The trade of the country with foreign markets is also in very satisfactory shape, and whatever influences may for a time operate to shut off business which has been coming to our mills and factories, the general trend of things is toward a steadily increasing foreign trade.

NOTES ON PRICES.

Cast Iron Soil Pipe and Fittings.—At a meeting of the manufacturers of Cast Iron Soil Pipe and Fittings, which was held in Milwaukee, Wis., on February 26, prices were advanced 10 per cent. This advance had been deferred from the last meeting, which was held in New York City in November. At that time an advance of 5 per cent. was contemplated, but owing to the continued increase in the cost of pig iron an advance of 10 per cent. was decided upon by the association. Conditions of sale and regulations regarding shipments and territory are unchanged. The association also adopted prices which are to be charged to plumbers, contractors and other parties in the trade who are not jobbers. These prices are as follows:

2 to 6 inch Standard Pipe, 50 and 10 per cent.
2 to 6 inch Extra Heavy Pipe, 65 per cent.
2 to 6 inch Standard and Extra Heavy Fittings, 70 per cent.
Larger sizes of Pipe and Fittings, 50 per cent.

There will be a freight allowance on all carload shipments. Less than carload shipments are to be f.o.b. foundry. All the members of the association have reported their sales, together with a list of their unfilled orders. All orders are now taken for shipment within 30 days, and specifications accompany every order. This prevents the placing of blanket orders and protecting or covering jobbers for excessive amounts of goods, which heretofore were liable to cancellation if orders did not materialize.

Sanitary Earthen Ware.—The Sanitary Potters' Association, in addition to perfecting their organization, have adopted new prices which show an advance of 5 per cent. to the jobbing trade. They have also effected an arrangement among the members whereby it will be impossible for any member of the association to break prices. This arrangement has been brought about through the co-operation of the different associations of jobbers throughout the country. The new prices and discounts will be enforced upon all staple Sanitary Earthen Ware on and after March 1. The discount to plumbers will be 50 per cent. from the standard American list, which has been in effect since July 17, 1899, among the members of the Sanitary Potters' Association. The sales of all the members are to be confined exclusively to jobbers. Seat Attachments, Spuds and Metal Connections are to carry the same discount as the Earthen Ware. Packages are to be charged net extra as per list. The association, in confining their sales to the jobbers exclusively, have extracted from the jobbers a promise that all of their purchases of Sanitary Ware must be confined to the wares produced by the members of the Sanitary Potters' Association. If any of the members of the Sanitary Potters' Association sell goods to the jobbing trade at any price or on any terms different from those established by the association the jobber, according to his agreement with the potters, is compelled to give the association a written notice of this fact. This he is to do without specifying names or details. This is required of the jobber in order that every member of the association may have an opportunity to sell as low and upon as good terms as any other one, thus assuring all customers that they will be able to buy as cheaply and upon as good terms as any other jobber. The jobbers also agree not to sell any ware to jobbers who do not take their requirements in Earthen Ware from the members of the Sanitary Potters' Association. The parties composing the membership of the Sanitary Potters' Association are as follows: Trenton Potteries Company, Thomas Maddock & Sons Company, John Maddock & Sons Company, Keystone Pottery Company, Bellmark Pottery Company, Egyptian Pottery Company, Mercer Pottery Company, Brian Pottery Company, Acme Pottery Company, Ironsides Pottery Company, Riverside Pottery Company, Great Western Pottery Company, Willets Mfg. Company, Sanitary Earthen Ware Specialty Company and Standard Sanitary Mfg. Company.

Wrought Iron Pipe.—The National Tube Company, with the aid of the parent company, the United States Steel Company, have the Wrought Iron Pipe situation entirely in their own hands, and the United States Steel Company have put the price of Skelp, from which all Wrought Iron and Steel Tubing is made, at such a price that the independent Tube companies, who are in a great measure dependent upon them for their raw material, are compelled to make prices which are similar to, if not higher than, those of the National Tube Company. It is reported that Wrought Iron Pipe is to advance on March 1. This is pretty well understood in the trade, as the agents of the Tube Company have been working for the past two weeks cleaning up all the business that remained unbroken, so that when new prices are announced all the friends of the National Tube Company would be fully protected for their wants. Persons who are in a position to know predict a great scarcity of Wrought Iron Pipe and Tubing during the summer months. They claim that the production is entirely inadequate to the present demands. It is said that by July 1 fully 75 per cent. of the producing capacity in Tubes will be controlled by independent concerns, but

even though the independents have this advantage over the National Tube Company, they will still be at a disadvantage, inasmuch as they will be compelled to go to the United States Steel Company for their raw material. While this continues the National Tube Company will have entire control of prices in the Pipe market.

Solder.—Following the stiffening in the price of Pig Tin, manufacturers of Solders have advanced their quotations. Half and Half, guaranteed, in small lots. is now quoted by jobbers at 17 to 17½ cents per pound, and No. 1 at 14½ to 16 cents.

Window Glass.—No new developments of importance have occurred in the Glass market during the week. Large buyers are not placing orders for Window Glass, owing to the unsatisfactory condition of the market. The Jobbers' Association are quoting a discount of 90 and 10 per cent. from store.

Cordage.—The manufacturers of Manila Rope have again advanced that commodity ½ cent, and Sisal Rope 1 cent a pound.

White Lead.—Transportation in this section of the country has been so seriously interfered with that very little spot business in White Lead in Oil has been done. Orders for future shipment are being received in fairly good volume, with prospects of a good spring trade. Lots of less than 500 pounds are quoted at 6½ cents per pound and smaller quantities at 6¾ cents.

Linseed Oil.—The market is firm and quiet at previous quotations. Buying is confined to the immediate requirements of the trade, while large consumers appear to have their present needs supplied. Crushers are strong in their views and are not offering inducements in the matter of price to secure orders. City Raw is quoted at 64 cents per gallon.

Spirits Turpentine.—The Turpentine market is quiet at unchanged quotations. Inclement weather and recent holidays have probably had an effect on the demand. Retail quotations are 45½ to 46 cents per gallon.

Old Rubber.—The demand for Old Rubber is rather tame. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb	5½c.
Rubber Shoes, less than carloads, per lb	6¾c.
White Wringer Rolls, per lb	6¾c.
Inside Bicycle Tubing, per lb	21½c.
Outside Tubing, per lb	6½c.

TRADE NOTES.

The J. D. Smith Foundry Supply Company, Cleveland, Ohio, are sending out an attractive little pamphlet, entitled "A Few Points About Plumbago and Silver Lead." The work is gotten up in artistic style, and is profusely illustrated with views of portions of the globe in which Plumbago is found, together with pictures of the natives of those regions. The letterpress contains much useful information regarding Plumbago and its application to foundry purposes. The last pages of the pamphlet contain a list of the various Foundry Materials manufactured and sold by the company.

Lionel M. Stern of the National Paint & Varnish Company, Cleveland, Ohio, has favored us with a copy of his treatise on "The Preservation of Metals," which is described as a practical, comprehensive handbook for architects, builders, mechanical and civil engineers, painters, metal workers, property owners and any one supervising the maintenance of steel and iron structures. The publication is a pamphlet of 22 pages, inclosed in a paper cover. It gives exhaustive directions for the application of paints and other preservative materials on metal surfaces, the protection of those surfaces before the reception of the paint, and information as to colors of paints and the oils to be used with them. A section is also devoted to the consideration of rust and other destructive agents.

The factory of the Hampden Corundum Wheel Company, Springfield, Mass., was almost totally destroyed by fire last week, causing a loss of about $50,000.

It is said the opening of navigation in the early spring will find the railroads facing the worst car famine in their history. With but little ore moving now and coal traffic also light, the railroads are unable to supply enough cars to carry coke to the furnaces, and with the opening of navigation, when ore and coal movement will be heavier, the situation is likely to be much worse, instead of better.

The Sportsmen's Show.

The out of town dealer who visits New York from March 5 to 19 will combine business with pleasure by visiting the eighth annual exhibit of the Sportsmen's Association, which opens in Madison Square Garden next Wednesday. Many a useful hint on displaying sporting goods can be gained, as well as the best information about them and their sale. Among the things that will be of special interest will be camp stoves and cooking equipment, ammunition, fishing tackle, knives and guns, which are handled by many house furnishing goods dealers. Then, as a matter of diversion and entertainment, the show will have many attractions, in addition to the display of goods, which should prove of equal interest, even if not from the point of profit, for the latest in boat motors, bicycles, automobiles and similar devices not yet in such general use as to be familiar with all will be on exhibition.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.

Metal Ceilings for Offices.

Berger's Classik Metal Ceilings are just as suitable for Offices as they are for Stores, Churches, Schools, Restaurants, Halls, etc. They are economical, mechanically excellent, and of great artistic beauty.

They can be had in plain or ornamental patterns; can be decorated to harmonize with finish of room and of furniture. They have valuable constructional features which simplify their erection, are easy to keep clean, stand wear and tear; ***STAY UP.***

"BERGER'S Classik" METAL CEILINGS

are High Art ceilings, handsome in design, correct in style and stamped with a clearness which brings out the details in bold relief.

If you have only seen the ordinary run of stamped ceilings, it is more than likely you do not realize how much better and more attractive Berger's Classik Metal Ceilings are.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

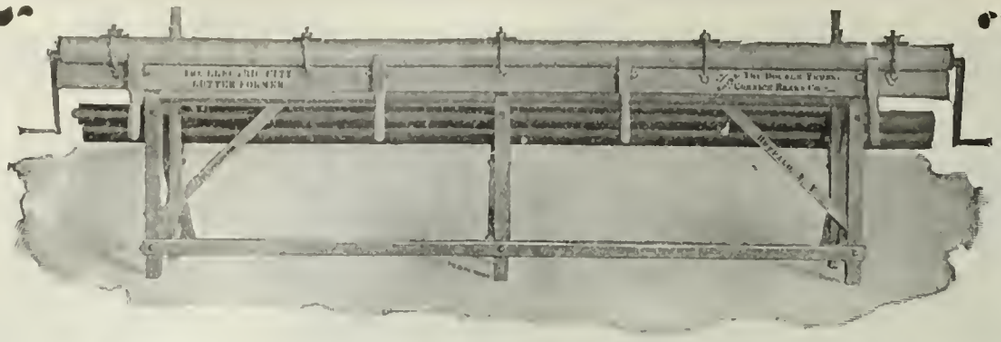
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

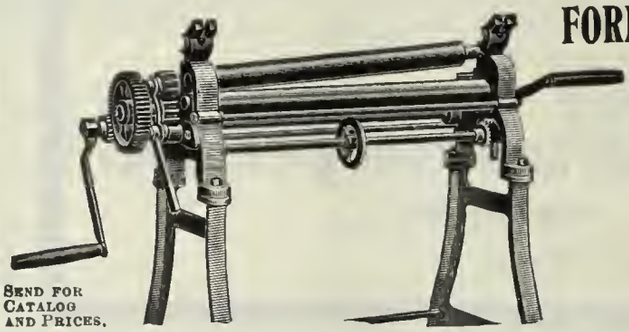
THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do quicker work. No other machine can do better work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.



Ask us about it. We gladly furnish information and price on request.

It is used extensively in every State in the Union. It withstands extreme heat or severe cold, and has a tenacity and elasticity peculiarly its own. It is ready for use, easily applied, protects and preserves any exposed surface.

For Tin and Iron Roofs, also Bridges, Gas Tanks and Underground Pipes

This Paint has never been equaled. **TIN ROOFS,** even when rusted, broken and leaking, can be rendered water-tight and serviceable; our Asphalt Roof Paint and Cement fills up holes, breaks, joints, and by its elastic and tenacious qualities keeps the roof tight.

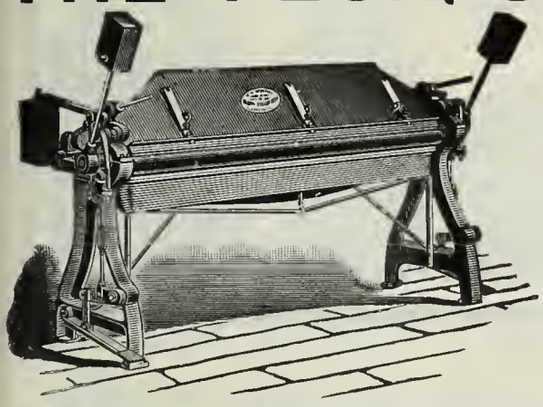
STOWELL MFG. CO., - - Jersey City, N. J.

THIS IS AN ALL IRON BRAKE

Length, 8 feet, well adapted to the ordinary work of cornice makers, easily handled and properly proportioned, without surplus material.

MADE BY THE

NIAGARA MACHINE & TOOL WORKS,



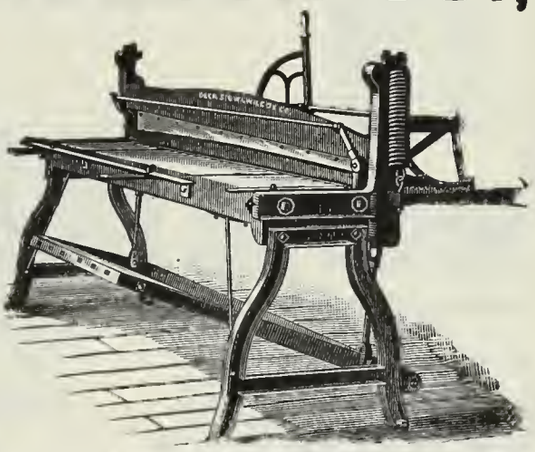
Mfrs. of Sheet Metal Tools

BUFFALO, N. Y.

THE PECK, STOW & WILCOX CO.,

New York,
—AND—
Cleveland, Ohio.

Tinsmiths' Tools of the Highest Grade.



HARE'S FOUR LEAF CORNICE BRAKE.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, IT IS THE BEST IN THE WORLD.

96 inches long.

Our *Improved Eureka Cornice Brake.* Will bend No. 20 iron.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.

With Lever Arc, Automatic Gauge. Will cut No. 22 iron

97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

★ SAWS ★

Our Star Hack Saws are now used in nearly all Iron-working Shops the world over. They are equally useful for farmers and men in all departments of life. They will cut iron and wood equally well. A nail does not dull them at all. One blade, which costs five cents, will cut off an inch square bar of iron 200 times without sharpening. We have cut off such a bar 337 times with one blade. All hardware dealers will furnish these saws. If not, we will send one steel frame and six blades by mail, prepaid, on receipt of $1.00.

All good blades are stamped with a ★

Heating Specialties. American Steam Gauge & Valve Mfg. Co., Bismark St., Boston, Mass., U. S. A.

We like to sell single ranges and furnaces, but we like better yet to sell them in bunches of six, a dozen or a hundred. Not long ago, we sent six of our Excelsior Double Oven Ranges to Mr. J. W Morrison of Holmesburg, Penna., and this is what he did with them:

"I placed six of the 806 Excelsior Portable Double Oven Ranges in the buildings known as the Annex to the Morelton Inn, at Torresdale, Penna. Every one of these ranges has given entire satisfaction."

That double oven Excelsior Range, by the way, seems to occupy a field of its own. It is uniquely good.

QUICK MEAL

Gasoline Stoves.

The Brass Float used in the tank of the "Quick Meal" Evaporating Stove regulates the pressure of the gasoline perfectly and insures a steady flow of gasoline at all times.

The German Silver Pointed Valve used in the "Quick Meal" Evaporating Sotve never rusts, and its smooth surface will always allow the gasoline to pass off freely and give an even, steady drip, and not gather it in quantities like the ordinary steel valve that rusts so easy and that is used in nearly all other evaporating stoves.

The Sub Flame Burner used in the "Quick Meal" Evaporating Stove is now entering its twelfth season without a change, it success has been proven and it has been shown that the "Quick Meal" Burner, with this attachment, has been the only successful Evaporating Burner ever made.

The Burner Drums used in the "Quick Meal" Evaporating Stoves are made of anti-rust material and are very strong and durable.

"Quick Meal" Evaporating Stoves are made so as to attract attention, please the eye and give satisfaction. They are the stoves to sell to your friends as they never fail. Catalogues now ready.

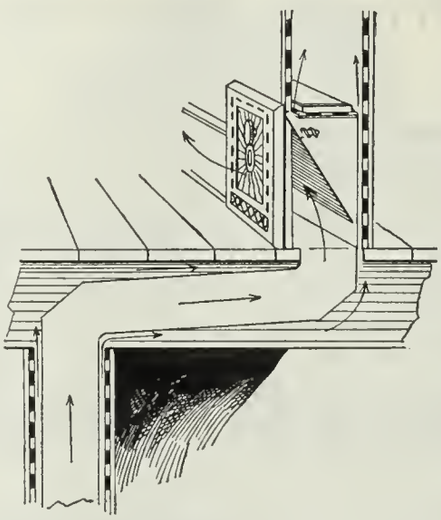
FURNACE WORK

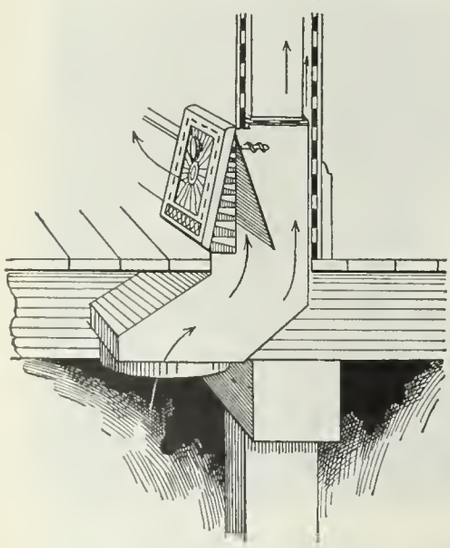


Is simplified by the use of

The Jones Side Wall Register

Each Register is also a
REGISTER BORDER,
REGISTER BOX,
DEFLECTOR and
FOOT WARMER,
and avoids Cutting Carpets and Floors.

They are
NOISELESS,
FIREPROOF,
PRACTICAL,
and have increased capacity equal or greater than floor registers.

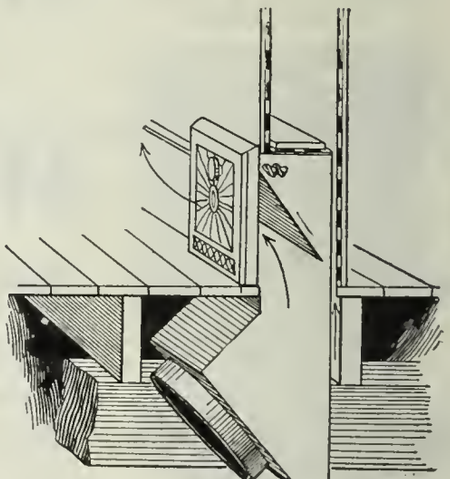


Showing a No. 15 Jones Register with wall pipe connected to second floor; also showing a No. 12 Second Floor Register and manner of connecting foot piece or boot in cellar.

They are made to be placed in the wall, utilizing the space from the lath on one side to the shoe moulding on the other, where one room is to be heated, and project into the room one and one-half inches at the floor line where two rooms (one on the first floor and one on the second floor) are to be heated from one large basement pipe.

The accompanying illustration shows the manner in which the wall pipe is connected, it resting on a cast-iron collar at the top of the register. This collar is flanged and has lugs cast thereon, which separates the inner and outer casing of the register box, and leaves openings at the top of the double box which permits the air to pass into the space around the wall pipe and upward to the attic and ventilating chimney.

It will be observed that cellar air is not used for protection, neither is cellar air, coal dust, etc., discharged into the sleeping rooms above, as is done with some side wall registers and all common registers where safety pipe is used.



Remember, the Register Box is included with the Register and is ready to install when received.

Double Headers.

We make double headers where two rooms on the first floor or where two rooms on the second floor are to be heated from one pipe.

The double headers have a deflector on each side, which prevents soiling the walls.

No. 13 or No. 14 Register for First Floor.

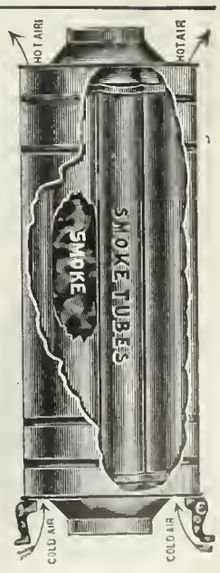
Large Radiators, easy to clean out.

Write for prices and secure the agency before the other fellow gets it.

Common Sense Circulator AND Radiator.



A FUEL SAVER.

This heater is so simple that its superiority over all others is plain. Being open at each end, the cold air is taken in at the bottom, passing out heated at the top, producing a constant circulation unequaled by any radiator, is easily cleaned out and if necessary can be repaired by any tinner. Takes the place of a joint of pipe 6 or 7 inch, outer casing 10 and 12 inches in diameter. Made of Wood's Refined and American Russia Iron. Can be used on pipe in back of stove, or room above, with any kind of fuel. It is the best heater made. Patronage of Stove and Hardware Jobbers solicited. If the house you buy of cannot supply you send direct to me. I am not looking for Department Store or Mail Order trade. Patent applied for.

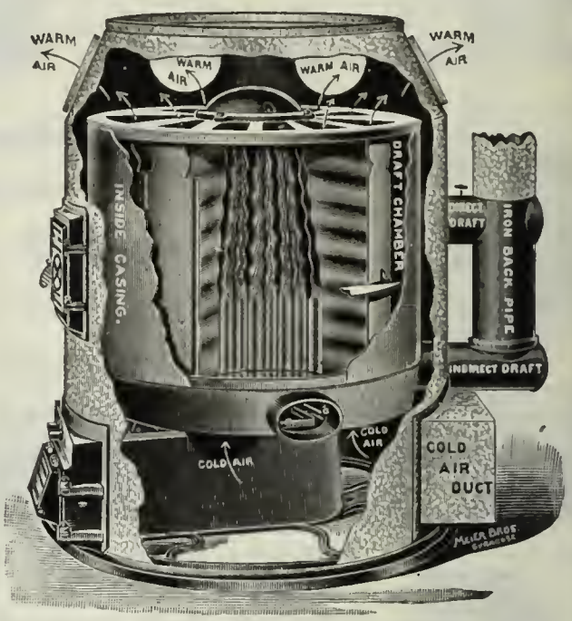
Druggist (absent minded, from force of habit): "Well, no; not exactly—but I have something just as good."—*Judge.*



The Kelsey Warm Air Generator.

THE PRINCIPLE

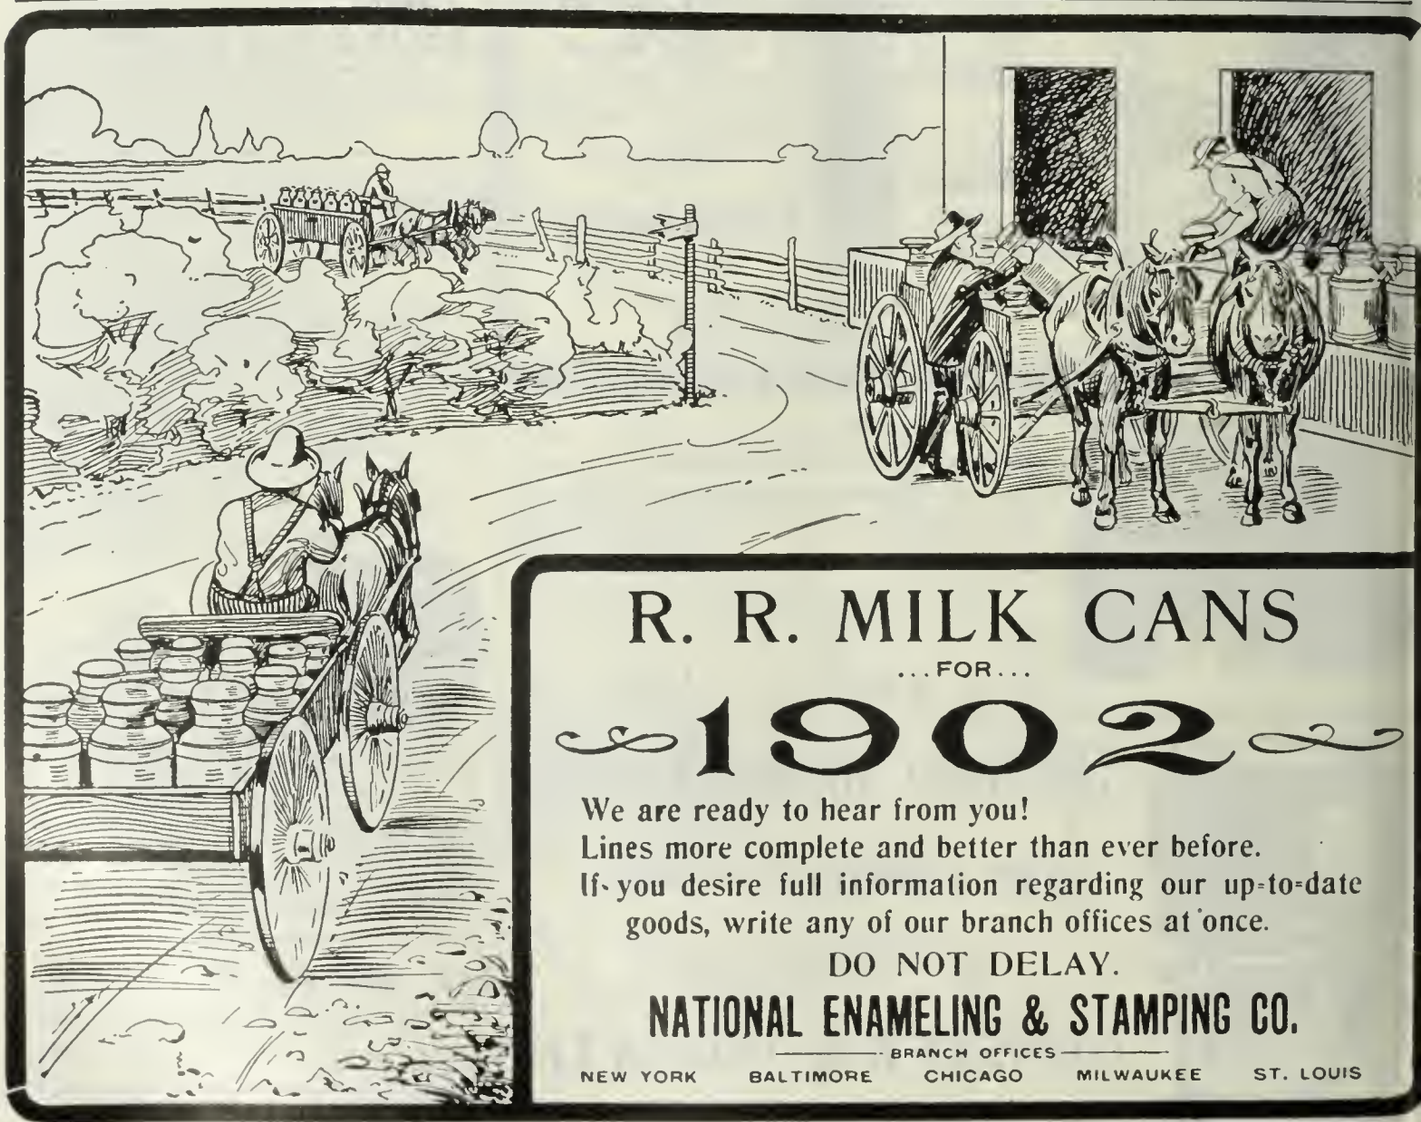
Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.



Ask for booklets **"KELSEY HEATING"** and **"OPINIONS."**

Index to Reading Matter.....Page 632

The Advancing Season.

For some weeks past the trade of the winter season has been falling off until, with the near approach of spring, it is almost lost sight of, and the enterprising tradesman is now afforded an opportunity to prepare for the change. Success comes to those who are prepared to meet the opportunity when it approaches. The stove dealer, the tinsmith and roofer, the corniceman and the plumber should all be using their spare moments to prepare for the demands that will be made upon them by the laggard citizen when he becomes aware that he needs something in their line. Men engaged in these different branches should foresee what their customers are likely to need and be ready for them when they come. With the energetic business man, even this is not sufficient. The advertising columns of the local papers should be utilized, and judiciously worded circulars distributed calling attention to the need of roof painting and strengthening up eave troughs and conductors, the purchase of a gas, oil or gasoline stove with summer cooking utensils, the provision of a larger gas supply pipe for the use of a gas cooking stove and the purchase of some suitable apparatus for supplying hot water when the coal range is out of use. These matters, together with visits to architects and builders in reference to new work, should keep many tradesmen busy at this time. Those who make advance suggestions of this character to the general public will not be forgotten when the necessities of customers become urgent. It is more than probable that other business beside that sought will also find its way to the establishment that becomes known for its enterprise. This fact should be sufficient incentive to have the shop and store look their best with freshly made up goods displayed to the best advantage, so as to produce the impression upon all who see them that goods and good workmanship are one of the trade-marks of the establishment, and prompt service one of its characteristics.

Programme Advertising.

One of the questions that received particular attention at the quarterly meeting of the Central Supply Association in Cleveland last week was that of profitable and unprofitable advertising. After considerable discussion of the subject it was agreed by resolution not to patronize souvenir programmes, theater programmes and advertising of kindred type. The demand for contributions of the character referred to has unquestionably become a grievous burden upon tradesmen and merchants generally. It has reached such magnitude that many business houses have now adopted a strict rule not to place their cards in anything but the regular mediums, such as trade journals, local newspapers or directories, from which there is a prospect of securing an adequate return for the money invested. This is a sound business policy and one that should be generally followed. It is time that a decided stand was taken in the matter by business men generally. It is far better to make a donation of money outright to any cause that is held worthy of support than to give it under the guise of advertising, and so furnish the promoters of the undertaking with the means of bringing pressure to bear upon other business concerns. Programme advertising is unquestionably unremunerative and as a matter of business should be discouraged. In some cases it is little short of a species of blackmail. Even where the causes sought to be benefited are in themselves admirable, the methods of those who secure advertising for publications connected with them are sometimes of such a "stand and deliver" kind that the unfortunate business man is coerced into giving up an "ad." against his better judgment and so creating a precedent of which solicitors of similar favors are not slow to avail themselves. He is presently swamped under an avalanche of demands for programme advertising for church fairs, social and benevolent societies, public ceremonials and what not. Better take a firm stand and consistently refuse all such advances on the ground of sound business policy.

Distributing Gas Under Pressure.

The official report made to the Fire Marshal of Chicago on the recent disastrous explosion of gas in that city contains the statement that natural leakages exist in all gas mains, varying from 10 to 25 per cent. "The leak," says the report, "usually seeks the air by the shortest route through the ground, vertically, if possible, but when the ground is frozen the gas cannot escape through the crust, but accumulates in pockets until, if not given free access to open air, it becomes mixed with air and explosive. An examination of gas mains in buildings near the scene of the explosion discovered the fact that not the smallest leak could be found in them. It was also found that gas of a similar odor, consequently of artificial production, exists in the sewers. If the sewers were not ventilated and frequently flushed it might accumulate in explosive quantity." The nuisance of the gas escaping from the mains through which it is distributed has become seriously objectionable whenever a street is opened for repairs of any character in most of the large cities. While it is improbable that any action will be taken by the authorities to force the gas companies to distribute their product through mains which will not, from leakage, make the opening of the streets a nuisance, the authorities can control the leakage or insist that the gas shall not be distributed under heavy pressure. At the meeting of the New England Association of Gas Engineers in Boston in February, a paper on "Distributing Artificial Gas by Pressure in a Subur-

ban Locality," was read by George F. Goodnow of Waukegan, Ill., in which the author said: "Heretofore it has been customary with gas companies to distribute their gas under a pressure of a few ounces, but within the past three years gas mains of small size have been laid through suburban districts, owing to the small cost, with the intention of carrying a pressure of 20 or more pounds per square inch, so as to deliver the gas at a distance of 12 or 14 miles. The point of compression without disadvantage to the gas has not been determined, but that a pressure of 25 or 30 pounds will not commercially deteriorate the quality of gas has been found in practice."

In the discussion of this paper the statement was made that "high pressure, in the sense of distributing gas through mains at 10 to 15, 20 or 30 pounds, has not only come to stay, but is growing and growing rapidly. The original line was built at Phœnixville, Pa., but two years ago, and now there are nine such pressure distributing gas systems in different parts of the country. It has been found useless to attempt to stay the hand of progress, and the fact that suburban districts that otherwise could not be supplied with the convenience of gas lighting system can be supplied profitably by small mains under high pressure is sufficient in itself to cause an extension of the custom." In view of the report of the Chicago official, however, it would seem advisable for municipal authorities to take more interest in the character of the gas mains laid, and the method of laying them in order to prevent a leakage, which is not only objectionable but dangerous. As benefit appears to be derived from the new method of distributing gas, it is quite probable that high pressure gas distribution will be attempted in old mains, or that the same material that has heretofore been used in the low pressure mains will, in order to save the cost of plant, be used in smaller mains and high pressure resorted to in order to supply the customer. It has already been demonstrated that very small pipes under high pressure will supply a much larger quantity of gas than was formerly considered possible by experts familiar with the old low pressure system. Under the circumstances, however, it would seem possible that all the advantages attending the high pressure system could be obtained, along with safety and the abolition of the nuisance of leaking gas, if what was saved in the cost of building the mains was expended in having them constructed of a gas proof material.

Oil in Lieu of Water.

A remarkable report comes from New Orleans to the effect that John W. Gates, the steel magnate, who is largely interested in the Beaumont oil industry, has offered to buy the New Orleans water works for $2,000,000, not with the idea of supplying the city with water, but with the design of closing the mains for water purposes and reopening them for use in the distribution of oil. The plan attributed to Mr. Gates is to convert the present reservoir of the New Orleans water works, which holds about 20,000,000 gallons, in a huge tank for the storage of Beaumont oil, using the 500 miles of mains connected with it, and running into every factory and to most of the private houses of the city, for the conveyance of oil. It is claimed that New Orleans could thus be supplied with fuel at a cheaper price than any large city in the world, with the added advantage that consumers would only have to turn on the water cock to get as much oil as needed, the meter keeping an account of the amount supplied. Mr. Gates proposes, it is said, to pump the oil to the New Orleans reservoir from the Beaumont fields, and from the reservoir to distribute it by natural pressure, without pumping, to all parts of the city. According to the correspondent of the New York *Commercial*, from whom this information comes, there are two difficulties which stand in the way of Mr. Gates' plan, one being a litigation over the title to the water works and the other the question whether the underwriters and the City Council of New Orleans will consent to the water mains and pipes being used for conveying oil, thus converting New Orleans, as it were, into a great oil reservoir, with its soil everywhere saturated with this combustible substance. Mr. Gates, however, is said to be perfectly confident of his ability to overcome these drawbacks. The idea ascribed to him is novel and characteristically audacious. If carried into effect, a consummation which seems open to doubt, it might possibly lead to a revolution in the system of oil supply in cities. It is not clear, however, from the published report, whether Mr. Gates contemplates cutting down the water supply of the inhabitants of the Crescent City and substituting oil therefor. Such a proposal would be apt to lead to complications which would present more obstacles to the plan than those suggested above.

Paterson's Misfortunes.

The thriving manufacturing city of Paterson, N. J., has had a bitter experience in the past few weeks. While just struggling up manfully from the effects of the disastrous fire which laid its business section in ruins and strained to the utmost its recuperative energies, the city has received a second, and in some respects a more severe blow in the flood which this week devastated the manufacturing district and the poorer parts of the city. In the case of the fire the losses fell more directly upon the substantial class of citizens who were generally well insured, and but few people were thrown out of work. Now, however, the poorer citizens are the principal sufferers, the flood having not only invaded that part of the city in which they live, causing heavy personal losses to a large number of people who are ill prepared to sustain them, but also having damaged the mills and factories in which they were employed to such an extent that many of them will be closed for an indefinite period and their employees will be subjected to the distress consequent on enforced idleness. Seldom do two such severe disasters attack a city in so close a sequence. A community that has shown such admirable pluck and self-reliance as Paterson has displayed since the recent fire deserves the generous sympathy of the whole country in its latest visitation.

The floods and storms have been interfering again with both production and consumption of iron at a time when any delay is very seriously annoying. They threaten to prolong the shortage of material beyond the spring months, and are making more and more difficult the endeavors of important interests to accumulate finished goods in anticipation of the usual spring trade.

The fire loss of the United States and Canada for the month of February, as compiled by the New York *Journal of Commerce*, shows the enormous total of $21,000,000, as compared with $14,000,000 in February, 1901, and $15,000,000 in the same month of 1900, both of which were regarded as unusually disastrous months for the insurance companies. The Paterson and Waterbury conflagrations, of course, swelled this sum immensely. Both of those great fires are supposed to have been of electrical origin, and many experienced underwriters are of the opinion that electricity is responsible for the great increase in the fire losses of recent years.

STOVE AND FURNACE INTERESTS AT THE MINNESOTA HARDWARE CONVENTION.

Stove and furnace houses were well represented at the sixth annual meeting of the Minnesota Retail Hardware Association, held in St. Paul on February 26, 27 and 28. Numerous exhibits in this line were made in the parlors of the Hotel Ryan. The exhibits, however, were not confined to that hotel, displays being made at other places in the city. In the subjoined allusions to these displays it is to be observed that all were made in the hotel named except as specifically stated.

Buck's Stove & Range Company, St. Louis, made an exhibit consisting of Radiant high grade art base burners, steel ranges, steel cooking stoves and oak stoves in the Hotel Ryan. They also had an exhibit of their Great White Enamel line of stoves and ranges in the store at 436 Wabasha avenue. Here they displayed what is claimed to be the largest sample exhibit of stoves and ranges in the Twin Cities, comprising over 60 patterns. They distributed neat memorandum books for the use of members of the convention. J. F. Stapleton represented the company.

Rathbone, Sard & Co., Aurora, Ill., made a fine exhibit of Acorn stoves and ranges. Samples were arranged on cloth covered platforms 12 inches high, having the front of the platform beveled, with the name of each stove placed below it in large letters. The stoves shown comprised the Art Westminster, a base burner of the highest grade; the Century steel range, the New Modern steel range, the Rapid four-hole steel range, the Rival steel cook, the Albany oak, with duplex grate; the Classic high grade cast range and the Ivy wood base burner. A special feature of this exhibit was a number of large charts, hung on the wall, giving diagrams of correct and faulty chimneys. Specimens of stove pipes and chimney tops were also shown of special designs to secure draft. W. W. Strayer was in charge and distributed stick pins having aluminum acorns attached.

The Detroit Stove Works, Detroit and Chicago, made a good exhibit of the Jewel line. The samples shown consisted of the Domestic, a medium grade steel range; the Leader, a low priced, first-class steel range; the Bridal steel cooking stove and the Crown Jewel, a medium grade base burner. J. Allen Hasty was in charge.

F. & L. Kahn & Bros., Hamilton, Ohio, exhibited several samples of their Estate line of stoves and ranges. These comprised the Metal Estate four-hole cast cooking stove, the Estate oak and the Umpire Estate air tight. The oak stoves are highly decorated, having a heavy nickeled canopy overhanging the fire pot instead of the usual small foot rail. The air tights are also handsomely ornamented. W. L. Nesbitt had charge of this exhibit.

The Round Oak Stove Works, Estate of P. D. Beckwith, Dowagiac, Mich., were represented by J. O. Becraft and G. T. Adams, who occupied a large parlor which was visited by a constant stream of members. They distributed nickel plated Doe-Wah-Jack match boxes and Round Oak stick pins. Mr. Becraft was the recipient of a valuable testimonial from his admiring colleagues among the manufacturers in attendance on the convention, and the testimonial will undoubtedly be preserved among his most highly treasured mementos of convention experiences. It was accompanied by a certificate bearing the names and official designations of those who participated in the expense attached. The presentation speech was made by H. H. Roberts of *The Metal Worker*.

The Charles Smith Company, Chicago, exhibited samples of their furnaces and water heater attachments. Chas. Smith represented the company.

W. H. Bliss, representing the Robinson Furnace Company, Chicago, showed a model of the Robinson tubular furnace.

The Minnesota Stove Company, Shakopee, Minn., were represented by President G. L. Nye, David Meiss and A. E. Mattison. They found no difficulty in exhibiting their Coral line of stoves and ranges at stores in the vicinity. The company are building up a good trade in the Northwest. Mr. Nye entertained a theater party on Wednesday evening, showing his broad spirit by including another stove manufacturer among his guests.

The Roberts Heating & Ventilating Company, Minneapolis, showed the Storm King furnace of their Floral City line. This is a furnace having a steel plate body and a steel plate radiator, giving twice the fire travel and nearly double the heating surface of the ordinary furnace. They also exhibited samples of furnace fittings, which they are now manufacturing with special machinery, consisting of boots, stacks, &c. The company are Northwestern agents for the Perfect Gem steam and hot water heaters. Oliver N. Roberts was in charge.

The Abram Cox Stove Company, Philadelphia, made a large display of Novelty stoves and furnaces at 419 and 421 Jackson street. T. M. Gilfillan represented the company.

Enterprise Stove Company.

The 92-page catalogue which has been issued by the Enterprise Stove Company of Vincennes, Ind., shows an extensive variety of steel and gas ranges, cast cook stoves, heaters, &c. The goods are offered under the generic name Star, which, as a trade-mark, has become well known throughout many sections of the country. The leading place in the catalogue is given to the Domestic Star steel range for coal or wood, which embodies in its construction all the modern improvements. The exterior is embellished with cast ornamentation, in combination with nickeled parts, producing striking effects. The range is made in several styles and sizes, thus adapting it to many requirements. Among the cast goods may be mentioned the Grand Star, the Guiding Star and the Royal Star ranges, some of which are adapted for using coal or wood, while others are intended for burning wood only. The Watson Star is a steel cook, made with cabinet base and intended for using coal or wood as a fuel. This is referred to by the makers as "the best selling style of steel cook made, as the cabinet base gives the general appearance of a steel range." The body is of blue polished steel, and there is a large pouch feed door when coal is used, a broiler door with register, and the oven bottom is securely braced so as to prevent warping or buckling.

In the way of cook stoves, mention may be made of the Rising Star, the Guiding Star, the Grand Star, the North Star and the Royal Star. The heaters are represented with the Star Radiator as one of the leaders. This is not an air tight, being constructed on different principles. It is made in two grades, one of which is full nickel, while the other is minus the front rail and nickel columns. The Star Oak, with an air tight base, is another handsome construction for which strong claims are made. It is rich in its external treatment and the constructive features are of the modern type. Other goods include cottage parlor, Franklin, globe, cannon, laundry, Todd and air tight stoves. In the concluding pages attention is given to the Star Progress line of gas ranges and to the Star gas hot plates. Some valuable suggestions regarding good and bad flues are presented, together with directions for setting up and operating stoves.

"Steel Stoves for Summer Service and Dainty Dishes for Particular People" is inscribed on the front cover of a little pamphlet devoted to the Jewel Gasoline Stoves, made by the George M. Clark Company, Chicago. The catalogue is printed with a very pretty effect in black and green, and interspersed with illustrations and descriptions of the Jewel Smokeless Generator Gasoline Ranges are a number of pages of receipts for summer foods. One page is devoted to the Jewel Heaters, which are especially adapted to the use of householders for supplying hot water during the hot period, when there is no range fire to heat the usual hot water storage tank.

WESTERN IDEAS ON FURNACE HEATING.

BY IOWA.

An interesting and instructive article in the February 1st number of *The Metal Worker*, from the pen of C. E. Oldacre, has been carefully read by me, and I find it to be the result of close observation and full of good suggestions and help for heating men. But it fails, according to my experience, in a vital point. It adheres to the old idea of taking all cold or fresh air from outdoors. Mr. Oldacre says: "Return fresh air ducts are not to be commended;" "They are unsanitary, to say the least;" "Are not to be depended on as a rule;" "Good lodging places are afforded for microbes and germs of all kinds;" "Very bad should there be any sickness in the house;" "Any saving in fuel is undoubtedly at the cost of health."

Let me draw from my experience of 20 years in using what is known in Iowa as the "rotary method of handling the air." If Mr. Oldacre was in Iowa it would keep him busy to find a furnace run on his method. All run their furnaces on the "rotary" method, yet none of the bad consequences feared by him are to be found. The Campbell Furnace Company of Des Moines were among the first to advocate this system in Iowa, and they had to make a fight for it, which they have made to a complete finish in Iowa and parts of other States.

WHAT ARE THE ADVANTAGES OF THE ROTARY SYSTEM?

It takes less fuel to heat a given space. The saving is from 20 to 50 per cent., depending on construction of house.

It gives the only possible plan for getting thorough circulation of the air. It continually exhausts the cold air, draws the warm air from the ceilings down, warms the floors and evens the temperature. You don't have to keep the babies on the bed or keep your feet in two candy buckets to keep them out of the 2 feet of cold air on the floors, as by the old method. It evens the temperature all over the house. If one room has a tendency to be cold from winds, the cold air duct affecting it works more rapidly and the warm air moves in to balance the effect. The method works to perfection, not an inch of cold air resting on the floor when the cold air ducts are properly built.

When I was a boy I attended a church, and it was like all of the other churches from Maine to Los Angeles. They fired the furnaces to their destruction. If you sat in the pews you froze; if you sat in the gallery you cooked, and there was no floor midway where the temperature was just right. There we went to church, winter after winter, and suffered because we were ignorant of so simple a matter as the rotary movement of the air.

EXHAUSTING FOUL COLD AIR.

A stupid theory about ventilation for a time came to people's relief, partially. Scientists (ventilating) taught that the bad air was at the floors, because the "carbonic acid gas" thrown off by the lungs was specifically heavier than the air and therefore—so they reasoned—must fall to the floor (which is not true). So they built ventilating flues to take the supposed bad air from the floors. These, small and insufficient as they were, served a great purpose in causing the cold air to be pulled off the floors and the warm air to come down from the ceiling. They were no longer trying to fill a jug which was already full and which had no outlet.

This new "rotary" method is a still further advance, and is perfection itself in securing circulation of the air, which is the foundation and prime necessity of all good heating. For instance, in common sized houses we use ordinarily as much as three 20-inch galvanized iron pipes to carry the air from the floors to the heater, passing the air of the entire house through our "heating oven" several times every hour. The effect is marvelous. A prominent physician of Davenport, Iowa, says: "The difference in temperature between the floor and at the hight of 7 feet was from 2 to 4 degrees by actual test." This was in a very large 16-roomed house.

QUALITY OF THE AIR AND HUMIDITY.

Another advantage of the "rotary" air movement lies in this, that the air can be given any quality desired. It can be charged with disinfectants; it makes the air movement itself a disinfectant of the house. Few disease germs can live in a house heated on this plan. Further, it provides the only practical method known for giving the air of the house its natural and proper moisture. In weather near the zero point air will only carry about a grain of moisture to the cubic foot. Raised to a temperature of 75 degrees, it demands 8 to 10 grains. This is the cause of the dryness of furnace heating and heating by steam, stoves and hot water—by all heating that does not supply this demand resulting from the expansion of the air.

There has been a great deal of ignorant talk about furnaces, &c., destroying the moisture in the air. This demand from expansion must be supplied. This is the remedy. Our artificial heating has been the same as our heating to dry fruit or lumber—the expanded air in these cases took up the moisture not wanted. In our house heating it has licked up the moisture needed in the wood work, in the piano, in the plants, in the lungs, in the skin, in the eyes, &c.

Charles Abbott, a blind piano tuner of Iowa Falls, Iowa, said to the writer:

I have known in my work at least 75 pianos ruined by dry heat, causing the shrinking and cracking of the sounding board, and the drying effect on the hammers injuring the felting and causing lost action. When a piano is once damaged in this way there is no repairing it. It is ruined for good.

A piano tuner, writing to the *Musician*, says:

Now, when you put a piano in an overheated, dry room, all this moisture is dried out, and the sounding board loses its "belly" and gets flabby, and finally cracks. Even if it doesn't crack the tone loses its resonance and grows thin and tinny, and the felt cloth and leather used in the action dry up, and the whole machine rattles, and everybody kicks.

To moisten the air by the old method never has been satisfactorily achieved, although tried. It is impracticable.

PROPER MOISTURE TO AIR.

By the "rotary" method the proper softening of the air becomes simple, inexpensive, automatic and capable of complete and easy regulation as to quantity. This method we have used in over 1000 heaters. It has the indorsement of Dr. Kennedy, secretary of the State Board of Health of Iowa, and Dr. S. W. Williston, medical adviser of the State Board of Health of Kansas, writes: "I congratulate you upon having solved the problem of sanitary heating in a most satisfactory way."

Space will not permit further consideration of this most interesting and vital point concerning the healthfulness of a proper moisture supply to the air. If any one seeks to take issue with me I can give evidence and explanations that will close the question. From two to four barrels of water (open for evaporation) are used by one "rotary" method. The water is also used for storage of heat. An ordinary dwelling uses about 6 gallons a day in cold weather.

CLEAN AIR AND SUPPLY.

Still another advantage of this "rotary" system is this: Furnaces are mostly used in cities. Cities in winter are proverbially dirty and supplied with smoky, gas polluted, foul air, scarcely ever fit to take into a house. A sufficient supply of fresh air will in most cases filter into the house through the walls and a thousand crevices and be comparatively clean. In ordinary dwellings foul air is a bugbear of the wrongly educated imagination. The old method of bringing in air from outdoors was not for ventilation—that was a "blind." It was used because the furnacemen did not know of any other way to get the heat of their furnace into the house. So the air was rushed in—dirt, smoke and all—to the disgust of the entire furnace using world. That all this is a correct view is shown by the fact that the same amount of fresh outdoor air was provided for a house occupied by one old grandmother as for one having 25 robust occu-

pants. The continual circulation of the air of the whole house with the continual change of air—warm air passing out and cold air coming in—provides ordinarily all the fresh air needed. If any one thinks he must have an outdoor pipe he can have it, as it in no manner interferes with the constant "rotary" air movement of the house. He must have the "rotary" movement, and he can have both. When this "rotary" movement was first introduced it was denounced as "unsanitary," "criminal," "vicious," "destructive of the health of the people" and a "ridiculous merry-go-round." Every one of the parties who thus attacked it hereabouts is now using it in his furnace business.

Furnace Work Records.

The value of records of successful practice in any line of work has long since been established, yet the earlier furnacemen have left little that may be referred to for guidance in designing new work or locating errors in bad work and applying a remedy. With a view to aiding furnacemen in keeping a record of the dimensions of various parts of their work, a blank form is presented herewitb which will enable a record of several jobs to be preserved, so that comparison can be made and the important factors observed for guidance in future work. The value of such records would be very great to a man, for example, who, from any cause, finds himself obliged to take up the furnace work of an establishment as a new branch of business to him. If kept carefully it will enable a comparison to be made of the merits of different constructions of furnaces, piping, arrangement, &c.

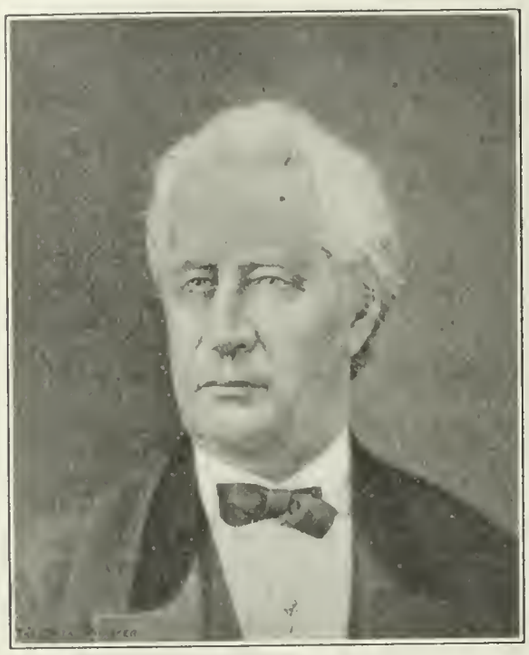
The blank gives some of the important dimensions that should be recorded and also bears an example showing its intended use. It should be stated, however, that the figures given in reference to "John Smith's" house are purely fictitious and of no value except to explain how the blank may be filled in. The blank is presented simply as a suggestion and may need changes to adapt it for general usefulness and convenience.

If furnacemen will examine the blank and fill it in with the records of some piece of work they will doubtless better understand its usefulness to them and to the men they are training in this branch of business. It is probable, also, that suggestions will occur to them as to an extension or remodeling of the blank, or as to supplementary blanks that may be considered equally advantageous for making a more detailed record of one building and its exposure, together with a record of an efficiency test with the temperature at various points. Copies of the blank of a larger size have been prepared and will be sent on application to those who desire them.

In other branches of the heating trade better records have been kept than in the furnace branch. There seems to be evidence, however, that furnacemen are giving more attention to the theoretical side of their work than heretofore. This is an indication of progress. Deductions from practical work can be better made when a tabulated record of it can be studied or referred to.

The record blank given herewith is commended to furnacemen, and their views, comments and suggestions in reference thereto are invited, in order that the interests of all engaged in hot air heating may be advanced by a discusison of the plan. Should something that may be universally approved and generally used for preserving data on furnace heating grow out of this blank there can bc no doubt of its benefit to the whole trade. If such a record is well kept for different classes of buildings it would enable the possessor to judge with certainty as to what should be provided to secure successful heating.

THE METAL WORKER RECORD OF FURNACE WORK.



If this blank is filled out as shown by the example given below, it will serve as a valuable guide in planning other furnace jobs.

GRANGE SARD, president of Rathbone, Sard & Co. of Albany, N. Y., has been elected president of the New Union Trust Company of that city. Mr. Sard, who is also president of the Park Bank and vice-president of the National Commercial Company of Albany, is regarded as one of the city's most able financiers and business men.

DEATH OF JAMES S. LITHGOW.

James S. Lithgow, president of the Lithgow Mfg. Company of Louisville, Ky., died on Friday, February 21, at his home, 1669 East Broadway, Louisville, in his ninetieth year. His death, caused by old age, was an absolutely painless passing away. In a recent issue we presented a sketch of the career of this veteran stove manufacturer on the occasion of entering his ninetieth year. Mr. Lithgow was born in Pittsburgh, Pa., on November 29, 1812, his parents being Walter and Frances Lithgow, both of whom were of Scotch-Irish descent. During the war of 1812 the elder Lithgow served as a soldier in the American army and took part in a number of engagements. The son, James S. Lithgow, spent his youth in Pittsburgh, but in 1833, when 21 years of age, moved to Louisville, where he had resided ever since, a period of nearly 70 years. Arriving in Louisville without means he started out to look for work, and the next day found a place in the tin and sheet iron shop of Bland & Coleman, where he worked for a short time. Subsequently he found employment with Andrew Barnett, a retail stove dealer, who also operated a tin shop. The

JAMES S. LITHGOW.

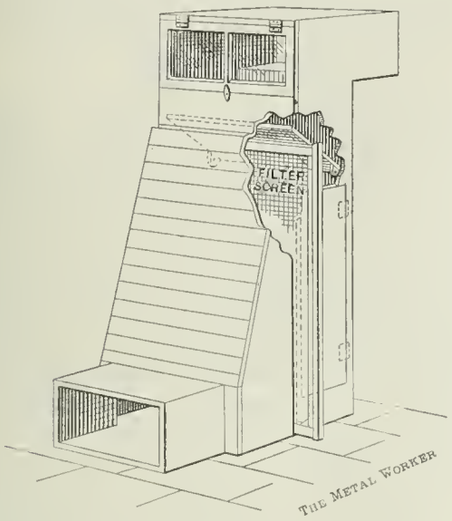
next employment was with Hicks & Taylor. During his engagement with that concern he became acquainted with Allen Wallace, a fellow workman, who subsequently became his partner, the firm of Wallace & Lithgow being organized in 1836. By industry and strict integrity this firm became one of the most prominent and successful in what was then known as the West. Early in their history they established a stove foundry. The firm continued until 1863, when Mr. Wallace died. A short time later the firm of J. S. Lithgow & Co. were organized, the members being J. S. Lithgow, J. L. Smyser and C. O. Smith. They built a factory at Clay and Main streets and an office building at Third and Main streets. At the time of the great financial panic of 1873 they were forced to suspend business, and later to dissolve. Subsequently the Lithgow Mfg. Company were formed, and have continued in business ever since, obtaining a high reputation for their Capitola stoves and ranges, Lithgow warm air furnaces, mantels, grates, &c. To-day they are among the leading manufacturing concerns in the South.

During his long career of 66 years in the stove and tinware business Mr. Lithgow was also interested in a number of other enterprises. He was for several years president of the Northern Bank of Kentucky, and at the time of his death was a director of the Franklin Insurance Company. He was also largely interested in the Jeffersonville Car Works and in several Southern railroad companies. In 1865 Mr. Lithgow was elected Mayor of Louisville, having previously served as a member of the Board of Councilmen and also as Alderman. He served as Mayor until 1867, when he resigned. Mr. Lithgow was one of the founders of the Louisville Fire Department and when a young man served in the Volunteer Firemen's Association of that city, of which body he was much the oldest living member. James S. Lithgow was a citizen of whom Louisville was proud. Living in that city for nearly three-quarters of a century, he was active along every line of work to the advantage of the community, and was also a prominent figure in business life. He was also prominent in church affairs and was six times a member of the General Conference of the Methodist Episcopal Church, South.

He was married in 1837 to Miss Hannah Craig, who was born in England and who died about 11 years ago. Of the seven children of this union four married daughters are living, as well as 19 grandchildren and ten great grandchildren. The two sons, Wallace Lithgow and J. S. Lithgow, Jr., predeceased their father, the last named being killed during the Civil War. Mr. Lithgow's funeral, which took place on Monday, February 24, at the Broadway Methodist Episcopal Church, was attended by most of the prominent citizens of Louisville. The body was interred in Cave Hill Cemetery.

"Opinions About the Kelsey Warm Air Generator."

The above title is embossed in silver on the drab cover of a 164 page book printed in two colors, issued by the Kelsey Heating Company of Syracuse, N. Y., with offices at 239 Water street, New York; 38 East Lake street, Chicago, and Brockville, Ont. The first page gives an account of the award received by the Kelsey generator at the Columbian Exposition at Chicago in 1893, and shows pictures of the medal awarded to the generator at the Pan-American Exposition in Buffalo. The next eight pages are devoted to half-tone engravings showing the entire construction of the Kelsey generator. The text gives such a description and explanation of it as to render the operation perfectly clear. The remaining pages are occupied by half-tone engravings of fine residences throughout the United States in which the Kelsey generator has been used for heating, and interspersed are testimonial letters, giving considerable information as to the coal consumption, heating capacity and other special features of merit which have been discovered in the every day use of this apparatus. Engravings are also presented of extra large residences, school houses, police stations and other spacious buildings, together with pictures of the Kelsey furnace set in a battery for heating large buildings.



A section of the catalogue is devoted to the opinion of dealers whose experience is based on the use of the generator for a number of years, some using more than 32 generators in one season. The last section of the catalogue is given up to churches, and a long list of the different towns in which churches, schools and large buildings are heated with Kelsey generators. Some pictures of buildings, in which the James Smart Mfg. Company of Brockville, Ont., have installed Kelsey generators, are also given. These views show fine buildings, and they are accompanied by testimonial letters from towns in various parts of the country where the company have established a trade. "Opinions About the Kelsey Warm Air Generator" is designed for distribution among prospective purchasers, and it should materially aid the furnace heating contractor in any section where the work is distributed.

The last page of the book is printed on blue paper, perforated so that it can be removed. On one side of the sheet is a series of questions intended to assist a prospective buyer in describing his building, and on the other side are two unfilled squares, ruled, to aid in drawing a plan of the building to be heated.

THE report that the New Castle works of the Pittsburgh Stove & Range Company would be removed and consolidated with one of the other plants of the company near Pittsburgh is denied.

SETTLING AND FILTERING CHAMBER FOR FURNACES.

Furnacemen are frequently called upon to furnish a furnace with a proper fresh air supply and at the same time prevent the entrance of soot and dust and overcome the effect of the wind blowing directly through the furnace. The William Miller Range & Furnace Company of Cincinnati, Ohio, have taken out patents for a settling and filtering chamber, by the use of which they claim that proper ventilation and a clean air supply are assured. Fig. 1 presents a broken view of the device. As the filtering screen occupies a vertical position, it is said to make provision for the entrance of a sufficient quantity of air to the furnace by presenting a large surface that does not fill up quickly and obstruct the entrance of air. The vertical position also allows the heavier dust carried in with the air supply to settle. The chamber is provided with a door so that the dirt can be removed as it accumulates before the screen is taken out for cleaning. It is also furnished with a controlling valve so that a maximum or minimum quantity of fresh air can be provided for the furnace at all times. The door that is provided in the chamber enables the air to be taken from out of doors or from inside of the building, as may be found desirable. This chamber is constructed of well seasoned, matched lumber so that no dust can get into the chamber from the cellar. The device is recommended for the cleanliness and pleasantness of the atmosphere that is maintained where it is used. The company manufacture it in three regular stock sizes, so that it can be shipped, knocked down and assembled by any ordinary carpenter on receipt at destination. Fig. 2 shows one of the filtering chambers in use in connection with a furnace, from which it can be readily seen that however dusty may be the air that enters the supply chamber the filter will clean it before it is passed to the furnace and through it to the registers.

Settling and Filtering Chamber for Furnaces.—Fig. 1.—Broken View, Showing Damper and Filter Screen.

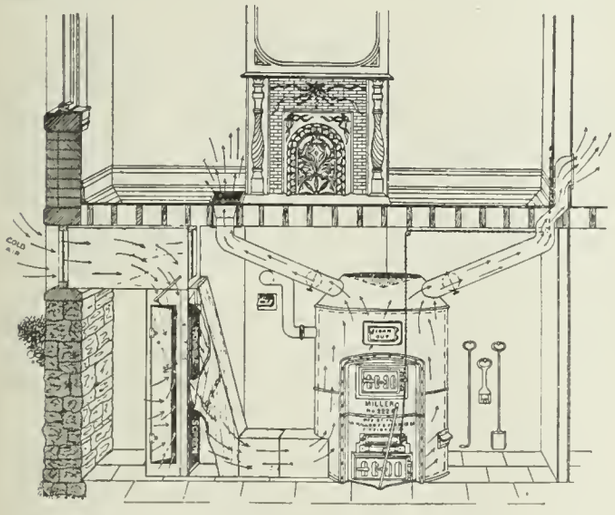


Fig. 2.—Showing Apparatus in Use.

Kernan Registers.

We have received from the Syracuse Stove Works of Syracuse, N. Y., with branch office at 231 Water street, New York City, a copy of their 1902 catalogue of Kernan improved hot air and ventilating registers, which has just been issued from the press. The catalogue is gotten up in very artistic style, with sage green folding cover and deckle edges. The whole is inclosed for mailing in a dark green envelope, and the address written in white ink has a striking effect. The catalogue is finely printed in black and red and contains numerous halftone engravings of the company's Græco-Roman design of registers. The pages are further embellished with artistic headings and tail pieces. The special points of merit embodied in these registers include simplicity of construction and operation, the special construction of the box and valves, thickness of ends on valves, evenness of movement, unusually large air area of face opening and the general excellence of design and finish. It is further pointed out that the borders and faces are interchangeable with standard makes. By means of a patent brass non-corrosive nut case with sleeves the operation of the lever is made absolutely noiseless, smooth and easy, so as not to interfere with the thermostat attachments. These registers are made in black and white japan finish, imitation gold, silver or copper, bronze, nickel plate and electro plated in brass, bronze or copper and of oblong or convex form, also with circular top. The thermostat attachments are especially recommended for use in school houses, where these features will be found of great advantage. Slate and soapstone borders for registers are also shown in the catalogue, as well as face plates made extra heavy and highly finished in black japan.

The Indianapolis Stove Company.

We have received from the Indianapolis Stove Company, Indianapolis, Ind., a copy of their catalogue No. 107, relating to both steel and steel clad ranges and cook stoves, hot plates, hollow ware, &c. It consists of 72 pages, profusely illustrated with well executed engravings and is bound in paper covers. Interesting features of the opening pages are a bird's-eye view of the company's works and a *fac-simile* of the guarantee bond which the manufacturers give with their goods. Since the last edition of the catalogue was issued the company have added several cast ranges and cook stoves, and have improved and brought up to date their old favorites. Some directions for setting up and operating stoves are given, also a few words about chimneys. In the way of steel ranges the company present the Gloria, the Damascus, the Steel Clad and the Nickel Plate, all of which are made of "secret process" hammer steel, which is said to be always bright and never has to be blackened. All inside plates are of heavy range steel, securely riveted, and the oven bottom plates are of triple thickness, so that they will not buckle. The external treatment of these ranges is very effective, the nickel plated portions forming sharp contrasts to the black surfaces, which are embellished with more or less cast ornamentation. A new steel cook stove to which attention is invited is the Fashion, intended for using coal or wood. It is a four-hole construction and embodies the latest features. Among the cast goods may be mentioned the Perfect Kitchen Queen, the Crown, the La Belle, the La Grande, the Windsor, the Kitchen Queen, for wood only, the New Dexter, the Indianola and the Monon. The lines of hot plates are offered under the names of Lawrence, made in three styles, and Junior, made in two styles.

THE WHITING FOUNDRY EQUIPMENT COMPANY, Harvey, Ill., have booked an order from Manchester, England, for a complete foundry equipment.

DEATH OF WILLIAM H. SHICK.

In the death of William H. Shick of the Reading Stove Works, Orr, Painter & Co., Reading, Pa., which occurred on February 20, after an illness of several weeks, the Pennsylvania stove trade loses one of its oldest and most prominent representatives. Mr. Shick was born at St. Mary's, Chester County, Pa., on February 22, 1835, and at the age of 17 went to Milton, Pa., where he learned the stove molders' trade. He afterward moved to Philadelphia and was employed in a number of stove works in that city until the outbreak of the Civil War, when he enlisted in the Seventy-second Pennsylvania Volunteers, and served for three years. At the battle of the Wilderness he was wounded and captured, spending some time in Libby Prison. After a captivity of several months he was exchanged and soon after honorably discharged from active service. At the close of the war Mr. Shick went to Reading and assisted in the organization of the Reading Stove Works, with which he was connected up to the time of his death. He was a member of the Board of Directors of the company from their organization.

Mr. Shick was prominent in the Methodist Church, and at the time of his death was a member of the Board of Trustees of the Church of the Holy Cross, Reading. He conducted a Sunday school class in connection with the church. He was also connected with a number of charitable and philanthropic institutions. Mr. Shick is survived by his wife, three sons and a daughter. The funeral services were held by the Rev. Dr. Shanklin, at the Church of the Holy Cross, Reading, on Monday, February 24, and were attended by a large delegation from the stove works and many others.

At the annual meeting of the stockholders of the Reading Stove Works, held on the evening of February 20, at the office of the company, the following tribute to the memory of the deceased was adopted:

The death of William H. Shick, announced to the stockholders while in meeting assembled this 20th day of February, 1902, though somewhat expected, has come as a shock to all his business associates and friends. One of the original members of the firm of Orr, Painter & Co., he has been associated with the firm and the corporation up to the time of his death. No one was more devoted or faithful to the interests of the institution he helped to create and aided so largely to develop. His experience in the foundry and on the road made him a very helpful and useful member of its management. His rich abundance of good nature made him beloved by all who came in contact with him. His sturdy Christian character manifested itself in his whole life, business as well as social. His loss will be felt not only by the stockholders but by all the workingmen and officers and directors of the company. His life was full of charitable works in our community.

We, the stockholders of this company, shall miss his cheerful companionship and wise counsel at our meetings, none of which he failed to attend since its organization.

We wish, therefore, to record our high appreciation of the sterling worth, integrity and noble qualities of our departed friend and associate and to tender to his family our sincerest sympathy in their great loss.

We reverently hope that the Father of all mercies and healer of all sorrows will grant them His comfort and consolation in this sad hour.

ODD PLATES.

The Pioneer Stove Company of Columbus, Ohio, are distributing among their friends in the trade a 48-page catalogue, illustrating and describing their leading lines of specialties in the way of Cook Stoves and Heaters. The variety is such as to meet many requirements, and the goods are equipped with the modern improvements. Steel Ranges are included in the assortment, as are also Gasoline Stoves and Ovens, Heaters and miscellaneous goods. The company were established in 1826, and were incorporated in 1901.

George M. Clark & Co., Chicago, have issued a dainty catalogue treating of Stoves for summer service. The catalogue treats of the Jewel gasoline construction. The Stove shown is the Jewel Smokeless Generator Range, which is illustrated in a variety of styles, showing its adaptation to varied requirements. The publication also gives a number of approved recipes for breakfast, lunch and dinner dishes, soups, salads, puddings, &c.

Rasmus Nielsen, manager of the Ida Hill Nickel Works, and Leonard H. Giles, representing the Giles Nickel Works, have formed a copartnership to be known as the Giles-Nielsen Nickel Works, at Troy, N. Y. The new firm represent two concerns well known among the Stove manufacturers and whose prestige and popularity were long ago established for good workmanship. They have leased the old Coutie machine shop in Front street and have made many changes. They are in a position, with increased facilities, to turn out the best kind of work in Nickel, Copper and Brass Plating.

At the annual meeting of the stockholders of the Reading Stove Works, Orr, Painter & Co., held at the office of the company in Reading, Pa., on February 20, the following were elected as directors for the ensuing year: Edgar Amole, Frank L. Connard, William H. Luden, W. Harry Orr, Jesse Posey, Robert P. Shick and Charles H. Williamson. Upon reorganizing, the board elected W. Harry Orr president, Edgar Amole treasurer and William S. Essick secretary.

The National Stove & Illuminating Company, Cleveland, Ohio, have placed on the market an Acetylene Stove which they claim thoroughly overcomes all the obstacles that have been experienced in the use of acetylene gas in a cooking apparatus in the past.

The H. E. Hessler Company, Syracuse, N. Y., are sending out the spring edition of their "Stove Repair and Tin Shop Supplier," which consists of 82 pages, with a well arranged index devoted to Stove Repairs, Stove Shakers, Furnace Repairs, Water Fronts and Stove Linings. The catalogue also shows cuts of many of the different supplies required by the Stove dealer and tinsmith, including Stove Bolts, Rivets, Fire Shovels, Pokers, Stove Urns and Knobs, Dampers, Registers, Check Drafts, Furnace Pipe and Fittings, Tin Plate, Sheet Iron and Zinc, Eave Trough, Elbows and a line of Plumbers' Goods, Iron Goods and Fire Pots, with a great variety of Tools. The latter portion of the catalogue is devoted to Coal Hods, Hollow Ware, Lanterns, Refrigerators, Gasoline and Oil Stoves, Paints, Enameled Ware, Tinware and House Furnishing Goods with Hardware and Cutlery.

Capt. James A. Fenn, superintendent of the Stove foundry of Rathbone, Sard & Co., at Aurora, Ill., has retired from business and has been succeeded in the superintendency by Oliver White of Albany, N. Y. Captain Venn has had charge of the Aurora plant since its erection 12 years ago. His retirement is a matter of regret to all connected with the concern. He has large real estate interests in Detroit, Mich., and proposes to make his home in that city. Prior to his departure from Aurora Captain Venn was presented with a handsome gold watch and chain by the employees of the works as a token of their esteem.

The Lizzie Lowman Stove Works, Sheffield, Ala., are reported to be running to their full capacity, with a large number of orders on their books. The concern have just received orders for 14 carloads of Stoves for immediate shipment, ten of which are to go to Shreveport, La., and four to Little Rock, Ark. They shipped three carloads of Stoves recently to California.

The Peninsular Stove Company, Detroit, Mich., are erecting a six-story addition to their establishment on Fore street at a cost of $42,000.

A dispatch from La Crosse, Wis., states that Chicago parties are negotiating for the establishment of a large Stove foundry in that city. It is stated that the promoters are not asking for a bonus, but only require the provision of a site for the proposed plant.

The Foster Stove Company, Ironton, Ohio, are erecting a new and enlarged plating room in connection with their works for the accommodation of their nickel plating plant. The building will have a concrete floor and be provided with a 25 horse-power engine and all the equipments of a modern nickel plating plant. The building now being used as a plating department will be adapted to the manufacture of Steel Ranges.

The Memphis, Tenn., *Scimitar* is authority for the statement that the H. Wetter Mfg. Company of that city, whose large Stove plant was recently destroyed by fire, are considering the advisability of building their new plant in some other location. The concern are reported to have received a number of tempting

inducements to locate in other parts of the South, and a general meeting of the stockholders will be called as soon as the insurance on the burned plant is settled, when plans for the future will be decided upon.

J. S. GRAHAM, secretary of the Pittsburgh Stove & Range Company, is credited with the statement that plans have been completed for a new plant, to be erected by the concern at Beaver Falls, Pa., to cover nearly 23 acres of ground and cost over $300,000. Between 800 and 1000 men will be employed. The output will consist of Gas Ranges, Furnaces, Cooking Stoves and Ornamental Grates for coal and gas.

MINNESOTA RETAIL HARDWARE ASSOCIATION.

That the hardware merchants of Minnesota show a high degree of interest in their State organization was manifested by the large attendance at their sixth annual meeting, held in the Ryan Building, St. Paul, on February 26, 27 and 28. The Minnesota Association is probably stronger, numerically at least, than any other similar organization, having a present membership in excess of 500 out of a total of 800 legitimate hardware dealers in the State. This is a handsome percentage, and the officers of the association are to be congratulated on the splendid result of their work.

The first session of the convention was called to order on Wednesday afternoon by President W. H. Tomlinson of Le Sueur. Mayor R. A. Smith of St. Paul welcomed the convention to the city and was replied to by A. T. Stebbins of Rochester, who thanked the Mayor for his cordial greetings. President Tomlinson read his annual address, which contained a number of interesting statements, and showed the association to be in a highly prosperous condition. J. F. McGuire of St. Paul, who was next called upon, indorsed the welcome given by the Mayor and offered to the delegates to the convention the free use of the quarters in the Builders' Exchange of the St. Paul Retail Hardware Dealers' and Sheet Metal Workers' Association. J. C. Nolting of St. Paul, president of the local association, seconded Mr. McGuire's words.

The appointment of the following committees was announced:

INSURANCE: A. C. Hatch, Battle Lake; Knute Hansen, Battle Lake; Julius Schmidt, Wabasha; O. F. Olson, Brandon; A. E. Anderson, Rothsay.
PRESS: J. F. McGuire, St. Paul; C. Schroeder, Mankato; J. P. Watson, Rochester.
GRIEVANCES: E. H. Heins, Renville; C. V. Ferguson, Chatfield; P. H. Caley, Princeton.
RESOLUTIONS: A. C. Stebbins, Rochester; C. F. Ladner, St. Cloud; J. C. Nolting, St. Paul.

Secretary Thomas McCracken of Minneapolis then read his report, which showed a gain during the year of 72 new members. The report of Treasurer G. M. Evenson of St. Peter showed a satisfactory financial condition.

C. F. Ladner moved that an auditing committee be appointed, which was adopted. The president appointed the following: C. F. Ladner, St. Cloud; A. Mengh, Princeton; Geo. F. Derry, Plainview. On motion of A. C. Stebbins a telegram of condolence was ordered to be sent to Ex-President James E. O'Brien of Crookston, who was prevented by illness from being present.

The session on Thursday morning was devoted to a discussion of a number of interesting trade matters, and C. L. Sulerud of Halsted and T. H. Caley of Princeton gave brief addresses.

C. Schroeder of Mankato, for the Committee on Nominations, reported the following list of officers for the ensuing year:

PRESIDENT, W. H. Tomlinson, Le Sueur.
VICE-PRESIDENT, H. S. Cleveland, Minneapolis.
EXECUTIVE COMMITTEE: Three years, P. J. McGuire, St. Paul; A. T. Stebbins, Rochester; Charles F. Ladner, St. Cloud, succeeding C. F. Stremel, Minneapolis; S. R. Nelson, Owatonna, and C. F. Ladner.

The secretary and treasurer are appointed by the Executive Committee, which accounts for the omission of these offices from the list.

On motion of P. L. Norman of Monticello the committee's report was adopted and the secretary was instructed to cast one ballot for the nominees, who were declared elected. President Tomlinson thanked the convention for the honor of a re-election. The department store question was treated in talks by J. F. McGuire of St. Paul and T. H. Caley of Princeton and others.

On Thursday afternoon A. C. Hatch, president of the National Hardware Dealers' Fire Insurance Company read his report for the year. Secretary McCracken supplemented the report by stating that in January $50,000 insurance had been written and $1300 received for premiums, and up to February 22 $87,000 insurance had been written and $2700 received for premiums, with enough applications on hand to be written up to run February over $100,000, which would make it the largest month the company have ever had. No losses have been suffered in these months. It is expected that March will be still heavier.

P. W. Lyon of Janney, Semple, Hill & Co. of Minneapolis gave an address on "The Three Essentials," which he explained as being the manufacturer, the jobber and retailer in their relations to one another. M. De Motte of St. Paul read an interesting paper on "How to Write an Advertisement." Charles F. Ladner of St. Cloud reported that the committee appointed last year to consider the advisability of joining the National Association recommended favorable action in that direction. The report was adopted unanimously.

The convention then went into executive session and a lively discussion ensued relative to trade practices which interfered with the interests of the retail dealers. Announcement was made that the Executive Committee had elected W. A. Barto of Long Prairie treasurer for the ensuing year. A motion was passed authorizing the Executive Committee and secretray to print a list of manufacturers and jobbers regarded as favorable to the association.

Julius Schmidt of Wabash stated that he had been requested to bring before the association the fact that many hardware dealers in Western Wisconsin desired to join the Minnesota Association, because they were so far from the regular meeting place of the Wisconsin Association as to make it inconvenient for them to attend the conventions in that State. He therefore moved that this be permitted in case the Wisconsin Association did not object. An amendment was made to include dealers from other States if they desired membership. The motion as amended was adopted.

On Friday morning G. L. Nye of the Minnesota Stove Company was invited to address the convention. He touched on the importance of marking goods high enough so as to be sure of including all fixed charges, then adverted to co-operative buying, which he approved if a practical method could be devised for the purpose. A resolution to the effect that the hardware traveling men of Minnesota be permitted to become members of the retail hardware association was adopted. It was decided to hold the next annual meeting in Minneapolis.

At the meeting of the Executive Committee on Friday afternoon W. H. Tomlinson and Charles F. Ladner were selected as delegates to the National Association, with the privilege of naming a third delegate. Thomas McCracken of Minneapolis was re-elected secretary for the ensuing year.

The annual banquet, which was held on Thursday evening at the Hotel Ryan, was attended by about 300 guests. J. F. McGuire acted as toastmaster, proving himself admirably fitted for this exacting position. Those who spoke were: President W. H. Tomlinson, Charles F. Ladner, W. A. Barto, R. A. Kirk, president of the National Hardware Association; George W. Cope of *The Metal Worker;* H. S. Cleveland, A. T. Stebbins, H. O. Spencer, H. P. Hall and Jesse A. Gregg.

The following were observed in attendance on one or more of the sessions of the convention:

L. W. DeVault, G. J. Clefton, S. A. Clefton and O. R. Manners, of the Western Supply Company, St. Paul.
W. H. Gruenhagen and C. S. Chatfield, Eclipse Stoves and Ranges, Minneapolis.
Samuel C. Silverman, St. Paul Stove Repair Works, St. Paul.
H. L. Chaffee, Simmons Hardware Company, St. Louis, Mo.

Paul R. Seidel, Geuder & Paeschke Mfg. Company, Milwaukee, Wis.
E. B. Waterman and T. J. Duffy, Jr., Black & Germer, Erie, Pa., and Chicago.
G. M. Gates, Thomas White Stove Company, Quincy, Ill.
J. W. Walker, Detroit Stove Works, Detroit and Chicago.
W. C. Sibley, the Malleable Steel Range Company, South Bend, Ind.
M. Ledwidge, Follansbee Bros. Company, Pittsburgh, Pa.
B. W. Cavell, the Art Stove Company, Detroit, Mich.
A. S. Dean, the Michigan Stove Company, Detroit and Chicago.
Theo. Schemmer, Lalance & Grosjean Mfg. Company, New York.
Charles H. Conner, the Fuller Warren Company, Milwaukee, Wis.
J. W. Torrence, Wm. Resor & Co., Cincinnati.
Charles Lindemann, J. P. Lindemann & Sons, Milwaukee, Wis.
Geo. W. Cope and H. H. Roberts, *The Metal Worker*.

KENTUCKY RETAIL HARDWARE AND STOVE DEALERS' ASSOCIATION.

The second annual meeting of the Kentucky Retail Hardware Dealers' Association was held in Liederkranz Hall, Louisville, on February 25 and 26, with a good attendance of members. The convention was called to order by President George P. Dehler, Jr., who gave his annual address. Mr. Dehler was followed by Secretary Paul Wagner, who read his report for the year, showing a total membership of 52, representing 15 towns in the State.

After the reports of standing committees had been rendered an address was made by W. P. Lewis of New Albany, Ind., president of the National Retail Hardware Association, who gave an account of the working of the national body.

The following committees were appointed by the president:

COMMITTEE ON RESOLUTIONS: W. P. Oldham, Mt. Sterling; J. L. Malin, Vine Grove; U. S. Shacklett, Fulton.
COMMITTEE ON NOMINATIONS: Kee R. McKee, Cadiz; Jos. Knapp, Louisville; Jno. C. Frederick, Owensboro; Geo. B. Minary, Versailles; J. W. Mahan, Lawrenceburg.

The Question Box brought out a number of interesting questions, among the more important ones being the following:

Should the legitimate dealer handle seconds?
Should a retailer advertise prices?
What is the best way to fight the steel range peddler?
Is it advisable to mark prices plainly?

Those taking part in the debates were: Kee R. McKee, U. S. Shacklett, J. H. Mahan, Ed. Steitler, Jr., P. C. Sower, J. C. Frederick, Jos. Kirchdorfer, J. M. Stone J. L. Malin, J. S. Ogden and Samuel Korb.

T. James Fernley, secretary-treasurer of the National Hardware Association, made an interesting address, which was listened to by the members with the closest attention and was awarded a rising vote of thanks.

The following persons were proposed by the Nominating Committee as officers for the ensuing year:

W. P. OLDHAM, Mt. Sterling, president.
J. L. MALIN, Vine Grove, first vice-president.
U. S. SHACKLETT, Fulton, second vice-president..
PAUL WAGNER, Louisville, secretary.
JOS. C. KIRCHDORFER, Louisville, assistant secretary.
HENRY HEICK, Louisville, treasurer.

They were unanimously elected.

The delegates selected to attend the meeting of the National Retail Hardware Dealers' Association, at Chicago, on March 19, 20, were Jno. C. Frederick, Owensboro, and Paul Wagner, Louisville, the alternates being J. L. Malin, Vine Grove; J. F. Van Deren, Lexington, and Jos. C. Kirchdorfer of Louisville.

J. L. Malin of Vine Grove read a paper on "Why a Dealer Should Join His State Association," and an address was made by Samuel B. Korb of the Louisville Retail Hardware and Stove Dealers' Association. Louisville was selected as the place of the next meeting, which is to be held in February, 1903, the particular dates being left to the Executive Committee.

On the evening of the 25th a very enjoyable smoker and Dutch supper was tendered the State association by the Louisville Retail Hardware and Stove Dealers' Association. Terstegge, Gohmann & Co., stove manufacturers, of New Albany, Ind., took advantage of the occasion and presented every one present with a souvenir in the shape of a small skillet, nicely finished and nickel plated.

Another social feature was a theater party, given to the members and their wives by the jobbing firm of W. B. Belknap & Co. Eighty-one persons took advantage of the invitation and went to Macauley's in a body. The occasion was a most enjoyable one, and the hospitality of this well-known house was thoroughly appreciated.

Among the manufacturers and jobbers represented at the convention were: Follansbee Brothers of Pittsburgh, Pa.; Terstegge, Gohmann & Co. of New Albany, Ind., and Bridgeford & Co., J. M. Robinson & Co., B. F. Avery & Sons, and Stratton & Terstegge of Louisville.

IOWA RETAIL HARDWARE DEALERS' ASSOCIATION.

The fourth annual convention of the Iowa Retail Hardware Dealers' Association was held in the Young Men's Christian Association Hall, Cedar Rapids, on March 4, 5 and 6. The attendance was not as large as at last year's convention at Dubuque, which was attributed to the fact that the annual convention had been postponed and the place of meeting changed, as noted in our last issue. The president, W. A. McIntire of Ottumwa, addressed the convention, expressing his gratification at the attendance and welcoming the delegates. W. H. Keating of Ottumwa then read his report as secretary, and George Lister of Manchester, his report as treasurer.

The following Reception Committee was appointed: Geo. E. Staehle, Earlville; L. Lindenburg, Dubuque; Jacob Seither, Keokuk, and A. C. Veitch, Oakland. Traveling men were called on for addresses, and T. C. Burdick of the Janesville Barb Wire Company, Janesville, Wis., made an entertaining talk.

The Question Box was then opened and several questions were discussed, among them being the following:

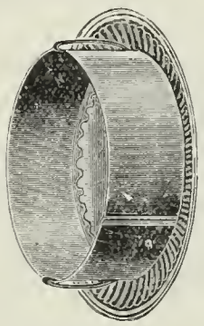
What is your experience in early closing, say at 6.30?

Numerous members answered, representing cities in different parts of the State, unanimously expressing satisfaction with the adoption of early closing hours and stating that they would never return to the old custom of keeping open until late at night, excepting on Saturday and a week or so before the Christmas holidays.

Is it an advantage to divide your trade with every house calling on you?

The discussion which this brought out was also one sided. The members speaking all thought it best to buy largely from one house, thus securing greater appreciation of the orders sent in, which will lead to greater interest by the house thus favored. The point was made that in stoves particularly one full line should be carried at least to meet the wishes of customers who desire a variety of sizes.

Is paint a profitable and satisfactory line to handle in connection with hardware?



Several members gave their experience in handling paint, all of them being favorable.

On Wednesday, H. A. Cole of Council Bluffs and C. R. Keating of Mt. Ayr read papers on "The Benefits of Organization," and S. R. Miles of Mason City one on "Credits." Other papers which were read and discussed during the meeting were one by George S. Staehle of Earlville on "Trusts in Their Relation to the Retail Dealer," and another by L. Lindenburg of Dubuque on "Our Competitors." The Commercial Club of Cedar Rapids entertained the delegates to the convention in the club rooms on Wednesday evening.

EUREKA REFRIGERATOR COMPANY, Indianapolis, Ind., have issued a catalogue of their high grade Refrigerators. These goods are illustrated in five regular stock sizes and in two different styles. These are opal enamel inside and outside, with oak cases and opal enamel lining.

Common Sense Flue Stop.

The Common Sense flue stop, an illustration of which is presented herewith, is manufactured by J. K. Schick, Fairbury, Ill. The advantages claimed for this flue stop, which has been patented by the manufacturer, are its simplicity, durability and ease of adjustment. It is

Common Sense Flue Stop.

claimed to be absolutely soot proof and a favorite with dealers on account of its ready sale. Mr. Schick has received a number of testimonials from users of this flue stop, and is prepared to send circulars and prices to any one who is interested.

Stove and Hardware Dealers.

W. H. Boutell & Co., Rochester, N. Y., have been succeeded by Boutell Mfg. Company, who will continue the manufacture of Apple Parers, Slicers, Choppers, &c., as heretofore.

C. B. Smith has succeeded J. H. Markel in the Hardware, Agricultural Implement, Stove, Furnace, Tinware, Plumbing, Glass, Paint, crockery and seed business, at Shrewsbury, Pa., and will be pleased to receive catalogues and price-lists relating to these lines.

W. R. Becker has disposed of his interest in the firm of Smith & Becker, Camden, N. Y., to L. P. Smith, his former partner, and has formed a new partnership with Conrad Klett, also of Camden, under the firm style of Becker & Klett, and will open a new store with practically the same line at 89 Main street, as soon as necessary repairs can be made to the store, which repairs will probably not be completed much before April 1. Becker & Klett will do a cash business as nearly as possible, and will pay spot cash for all goods purchased. The new firm will be glad to receive catalogues and quotations pertaining to Hardware, Stoves, Tinware, Sporting Goods, Agricultural Implements, Paints and Oils, Harness, plumbing and steam fitting goods, &c.

C. F. Flude has disposed of his Hardware and Stove business in Anthon, Iowa, to Hall & Brunnell.

The Milwaukee Wood Preserving Company, 804 Third street, Milwaukee, Wis., represented by J. Kornely, are offering to the trade a Wood Preserving Paint which is named Presser's Preservatine. This Paint is the original Carbonlineum. It is a German Paint which has been in use over 20 years, and has been very successfully introduced in this country. The manufacturers state that it is an antiseptic impregnant and covering, and is particularly valuable for the preservation of wood and for keeping dry and sweet stone or brick walls that are subject to damp and moisture. The manufacturers claim that wood treated with this Paint, whether below or above ground, whether in or out of water, will neither rot nor decay, the surface becoming almost as hard as stone. Preservatine gives wood a fine brown color, remains liquid for years, and is always ready for immediate use.

Those who have occasion to equip a bakery with an up to date oven and apparatus for handling the baking will be interested in a circular issued by Pembroke D. Harton, Philadelphia, Pa., which shows a general view of the oven and also a sectional view of the oven's baking wheel. The wheel revolves intermittently, bringing the shelves to the opening long enough for the baking to be removed and a fresh baking to be inserted.

Diamond Stamped Ware Company, Detroit, Mich., announce that W. S. Canright has been appointed secretary and manager of the company, vice C. D. Milne, who has resigned the position.

D. N. Clark, Shelton, Conn., recently filled one of his large show windows full of Universal Meat Cutters marked at 88 cents each. In ten days all in the window were sold with the exception of three machines. Mr. Clark says that the quantity of goods shown and the low price that was clearly marked brought the business.

The American Wringer Company, 99 Chambers street, New York, have just issued a complete general catalogue of 88 pages, illustrating and describing in detail the great variety of Horse Shoe Brand Clothes Wringers, Mop Wringers, Clothes Mangles, Toy Wringers, Clothes Dryers, Folding Benches for Wash Tubs and the different goods of their comprehensive line. The illustrations are printed in various tints, and the book has an illuminated cover. Particular attention is called to the ball bearing features and the quality of the rubber used in the rolls. The catalogue is an exceptionally complete one, and very artistic and attractive, and accompanied as it is with a new price-list of net prices on case lots, will be regarded with especial interest by the trade.

Francis R. Hope, New Egypt, N. J., presents a very pretty embossed card in red, white and blue, with a design on the front cover showing a sunburst, which calls attention to the fact that he handles the Sunshine Stoves and Ranges made by Orr, Painter & Co., Reading, Pa. He also makes a specialty of plumbing, steam and hot water heating and general tinsmithing work.

The Magnet Cement & Dressing Company, Philadelphia, Pa., have made John H. Graham & Co., 113 Chambers street, New York City, selling agents for their Rock Cement. This is a preparation for mending china, glass, crockery, stone, marble, metal, wood and bric-a-brac, and which is impervious to hot and cold water and dampness. It is put up in bottles to retail at 10 cents each, one dozen on an illuminated easel card to hang or stand, each of which is packed in a neat box, and 12 boxes, or 1 gross, in a case for shipment, the weight of which is 35 pounds.

George S. Battell, secretary and treasurer of the Zahner & Battell Mfg. Company of Kansas City, Mo., died suddenly last week from heart failure at the age of 46 years. He was born at Mendon, Ill., and there learned the tinsmiths' trade. In 1880 he went to Kansas City and entered the employ of W. E. Zahner in the Hardware and Tinware business. Three years later he was taken into partnership, and the concern were subsequently incorporated as the Zahner & Battell Mfg. Company.

The Western Windmill & Hardware Company of Midland, Tenn., have been incorporated with a capital stock of $60,000 by T. J. Martin, George Cowden and E. J. Mumford.

The warehouse of Eli Sieger, dealer in Stoves and Tinware, at Coplay, Pa., was destroyed by fire last week. The loss, which amounted to about $3000, was covered by insurance.

Thomas Briggs of West Manchester, N. H., has decided to sell out his Stove and Tinware business.

It is reported that a consolidation is being arranged with a number of prominent concerns who manufacture Woven Wire Products, such as Baskets, Kitchen Utensils, &c. The new corporation, it is said, will have a capital stock of $8,000,000. Capitalists connected with the United States Steel Corporation are said to be interested in the proposed new consolidation.

Prentice & Jones are a new firm who have started business in the retail Hardware, Tinware and Stove lines, at Newark Valley, N. Y.

John H. Carnes of the Joseph Dixon Crucible Company, Jersey City, N. J., died on February 28 at his home in that city, aged 68 years. He was prominent in the public life of the city, and had served as president of the Board of Fire Commissioners and as a member of the Jersey City Board of Finance.

A TIMELY HINT FOR ROOFERS.

The heavy storms of snow, rain and sleet which the past few weeks have brought will be a good test for all roofing work. A roof that will not leak under the recent conditions is as tight as it can be made. There are sure to be many roofs, however, which will show leaks as soon as thawing begins. Then the defective places should be marked, so that they can be easily found when the weather is favorable for repair work. The same thing applies to gutters and spouting. If after a snow storm the conductor is cleared of snow at the point of connection with the roof the danger of the tube freezing is lessened. Where there is no sewer connection the elbow at the bottom of the leader should be kept clear to avoid the choking of the leader, which would naturally fill with ice, expand and probably burst the seams of the pipe. This is more apt to occur in a plain leader than a corrugated one, because the corrugations allow for the expansion of the ice. A little foresight in this matter may save a great deal of expense and trouble.

WHAT SHOULD A TINSMITH KNOW?

BY W. A. F.

The questions recently asked and answered in *The Metal Worker* as to what a cornice maker and what a furnaceman should know naturally give rise to another question—viz., "What should a tinsmith know?" To judge from some of the advertisements frequently seen for tinsmiths one would certainly think it easier to tell what he should not know. In most lines of human endeavor this is an age of specialists, but the tinsmith, apparently, is expected to be a specialist in his and every other line.

As a first requisite the average employer wants a young man; next, he must have had a certain number of years' experience in each of from three to a dozen different trades. How any man can yet remain young after such an expenditure of time is an unsolved mystery, but the tinsmith is expected to do it, along with other things almost as difficult. If a young man is unusually bright and has the opportunity he may be able to acquire a good working knowledge of more than one trade, but life is too short for the average man to become proficient in more than one. It is proverbial that "a jack-of-all-trades is master of none." Versatility may have its uses, but the versatile man is not the one usually selected for special work.

What a tinsmith should know depends very much upon where he is located. If in the country, he will have to do more or less work which in cities and large towns falls to the lot of the plumber, the steam fitter and other mechanics. But no matter where located, an "all round tinsmith," as the advertisements generally read, means just what it says. He is expected to do any and every thing that comes along. What he really should know is his own trade first. That is, he should be able to cut patterns and make up almost anything that can be made of tin or sheet metal. After that, if he has the opportunity to acquire a smattering of other trades it is, of course, to his advantage to do so. But it is not reasonable to expect him to be an expert in more than one.

Peden Iron & Steel Company.

The partnership of Peden & Co. of Houston, Texas, composed of D. D. Peden, E. A. Peden and D. D. Peden, Jr., was dissolved on February 17 and the business transferred to a corporation under the title of Peden Iron & Steel Company, with an authorized capital of $250,000, who will carry on the business of the old firm under the same management as heretofore. The officers of the new company are D. D. Peden, president; E. A. Peden, vice-president and general manager, and D. D. Peden, Jr., secretary and treasurer. The business of Peden & Co. was established in 1890. Their sales last year were about $1,000,000. They employ eight travelling men and a large office and warehouse force. The business operations of the concern cover a wide territory, and they carry one of the largest and best assorted stocks of goods in the Southwest. The principal lines handled by the company are black and galvanized sheets, tin plates, roofing materials of all kinds, tinners' supplies, mill supplies, stoves, hardware, belting, pipe, fittings, valves, nails, wire, tools, light machinery and kindred goods.

Death of Charles A. Vaile.

Charles Albert Vaile of the firm of Vaile & Young of 216 North Calvert street, Baltimore, Md., died on February 24, at his residence, 1627 St. Paul street, Baltimore, of lung disease, from which he had been a sufferer for some years past. Mr. Vaile was a native of Richmond, Ind., where he was born 63 years ago. At the outbreak of the Civil War he assisted in raising a regiment of volunteers, in which he was commissioned lieutenant, serving throughout the war. During the years 1872 and 1873 he was employed as superintendent of the large sheet metal works of George Dwight, Jr., in Springfield, Mass., and for the three following years

CHARLES A. VAILE.

he was in business for himself in Worcester, Mass. In 1877 he went to Baltimore as superintendent for James Geddis, in which capacity he continued for several years. Upon the death of Mr. Geddis he formed a partnership with Louis F. Young, under the name of Vaile & Young, and continued the skylight and sheet metal business of Mr. Geddis on North street for a number of years. Subsequently the extension of the firm's business necessitated a larger shop and they moved to the present location in Calvert street, where they erected a large four-story building, using the basement for storage, the first floor for the office and cornice department, the second floor for the manufacture of skylights, and the third floor as a tin and jobbing shop, the fourth floor being used for the ventilating department. Mr. Vaile was the inventor of the well-known Vaile and Young skylight. He also superintended many large ventilating jobs during the 38 years he spent at the business. He was a frequent contributor to the trade journals and a recognized authority on sheet metal work. Mr. Vaile married Miss Eva Barnes, who, with one brother, John Vaile, survives him. He was a member of the Grand Army of the Republic and the Loyal Legion, and was also a vestryman of the Protestant Episcopal Church of the Messiah, in Baltimore, at which church his funeral services were held on Thursday, February 27. They were conducted by the Revs. Peregrine Wroth and C. Ernest Smith of Baltimore. The interment was made in Loudon Park Cemetery.

At a special meeting of the Board of Directors of the Baltimore Builders' Exchange complimentary resolutions were passed referring to the loss sustained in the death of Mr. Vaile, who was a member of the exchange, and a committee was appointed to attend the funeral.

Puddled Iron Sheets.

Believing that a large demand exists for sheets that excel in lasting qualities and can stand the test of time and weather, the Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, are sending to the trade throughout the country a little folder calling attention to the puddled iron sheets which they are now producing as a specialty. In this circular the company say: "The fact that roofing and siding made of puddled iron and placed on buildings 15 to 30 years ago is now in a state of perfect preservation, whereas buildings covered with steel sheets four years ago are riddled with holes, proves beyond a possibility of doubt that the lasting quality of puddled iron is many fold greater than that of steel." The company are making double refined puddled iron sheets in gauges 10 to 30, in widths of 44 inches and narrower, and in lengths of 144 inches and shorter. These sheets are furnished black, painted and galvanized, and either flat or corrugated. The concern are also the manufacturers of the New Process galvanized steel sheets, the coating of which is claimed to be of unusual toughness.

American Sheet Steel Company's Extensions.

Plans have been made by the American Sheet Steel Company for large extensions to the Wellsville Works, at Wellsville, Ohio; also the W. Dewees Wood Works, at McKeesport, Pa. Four mills will be added to the Wellsville plant, increasing it from a six to a ten mill plant. The main building also is to be extended about 100 feet and the entire structure will be rebuilt of steel, but this will not interfere with the operation of the plant. Two of the present mills are to be thoroughly modernized. At McKeesport, three mills are to be added, increasing the size of the plant from 13 to 16 mills. When the additions are completed, Persifor F. Smith, the district manager, will have 26 mills under his jurisdiction instead of 19.

The report that it is the intention of the American Sheet Steel Company to erect an open hearth steel plant and sheet mills at Carnegie, near Pittsburgh, is incorrect. Any extensions to existing plants of this concern will probably be made to works located in the Kiskiminetas Valley. A concentration of plants has been made at this place in the last year or two, and the sheet mills formerly located at Carnegie were removed to Vandergrift during the strike of last year.

Origin of Rosin Sized Sheathing or Building Paper.

For the facts contained in this sketch of the origin and growth of the manufacture of rosin sized sheathing paper for building and other kindred purposes, we are indebted to Chapman & Soden, 410-412 Atlantic avenue, Boston, manufacturers of roofing and paving materials, including sheathings and various coal tar products.

Previous to 1871, we are advised, the only papers used for sheathing purposes were tarred and common dry sheathing. So far as water proof properties were concerned, the tarred papers were excellent, but to many the odor was offensive; besides the wearing qualities were not good, as the heat in summer destroyed the life of the paper. The dry sheathing was good as a protection against wind, but would not shed moisture.

Some time during the year 1871 a paper was introduced, called rosin sized cane fiber sheathing. This product was supposed to have all the good qualities of tarred and dry sheathing, as well as being odorless and water proof. The paper was made near Norfolk, Va., from sugar cane, the method of preparation being somewhat peculiar. Having cut the cane into the required lengths the material was placed in an old fashioned muzzle loading cannon and then discharged against a brick wall. This so bruised and crushed the cane that it was easily prepared for the beating engine, and after being run into rolls of about 60 pounds each when dried, was ready for the market.

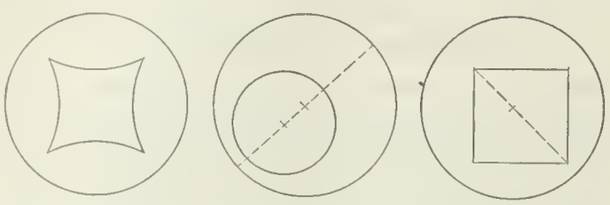
These goods were made for about three years, but, upon the destruction of the mill by fire, the production ceased, there evidently not being money enough in the venture. After this product was withdrawn from the market, the idea occurred to A. H. Soden of the firm of Chapman & Soden, Boston, Mass., of making rosin sized paper of the same material as used in the manufacture of the dry sheathing, and, by the addition of rosin obtain a water proof odorless sheathing paper, the life of which, unlike the tarred product, would not be destroyed by heat, and which would shed water. This resulted in the introduction of the beaver brand water proof rosin sized sheathing paper, which for a long period was a leading product in this class of goods, and even now is said to have a high position for its water proof quality. From this beginning have sprung, we are advised, the endless brands and qualities of rosin sized sheathing papers.

Carelessness in Slate Roofing.

It is proper to charge to slaters the faults that belong to them, and they are sufficiently numerous, but it is not always through the lack of skill, thoroughness or honesty that roofs fail to perform the function for which they are built. Even with the best intention and the utmost care some hidden fault is liable to come to light, it may be, many months after the work is completed; hence the custom prevails, says a writer in *Cement and Slate*, of requiring the slater to warrant his work for a given length of time.

We have known what appeared to be a most thoroughly laid slate roof to be extensively damaged by means of what was esteemed an excellence of construction. The slates themselves were of the best quality, they were skillfully applied, and the roof boards were sound and well seasoned. "Well seasoned," and therein lay apparently the root of the mischief. Being dry, laid closely and covered with roofing paper, all of which are among the desirable points, no sooner were the upper stories plastered than the under side of the roof boards became swollen by the rising moisture to that degree that the nails were started in many places, and the warping of the boards to which the slates were nailed broke them and let them slide down. In this case the boards curled by the swelling of the under surface. If the boards had been of inferior quality and but partly seasoned it is doubtful whether from this cause they would have warped sufficiently to injure the slates. Ample nailing would perhaps have held the boards to the rafters, but this was not the slater's business, although a good workman ought not to proceed with work knowing it is being done at a disadvantage.

On another roof a similar result followed an opposite cause. The roof boards were but partially seasoned when, late in the fall, they were covered with the roofing paper and then overlaid with slate. There was no trouble until some months afterward, when the house had been plastered, and, by means of thorough ventilation and heating, was thoroughly dry. Then the boards on the roof began to "get their backs up," and loosened the slates by the score. Here the boards curled by the shrinking of the under surface. If they had all been nailed through the middle to every rafter as well as at the edges this might possibly have held them, but few builders would think such thoroughness necessary. It is perhaps needless to say that in both cases the boards were spruce, and, as everybody knows, the old serpent himself is not more stubbornly inclined to warp and twist and crawl than is spruce lumber if it has any provocation or opportunity.



In the former of these two cases the trouble could doubtless have been prevented by providing thorough ventilation while the building contained any moisture, and in the latter by using well seasoned stock, which, it is safe to say, is always best for building purposes.

Obtaining Patterns for Shafts Mitering Upon a Ball.

"J. H. T.," New York City, writes: I should be pleased to have you solve in the columns of *The Metal Worker* the problems shown by the inclosed sketches. Fig. 1 shows the plan of a square shaft with concave sides mitering upon a ball. Fig. 2 shows plan of a round shaft mitering upon a ball, its axis passing to one side of the center of the ball, and Fig. 3 shows the plan of a square shaft similarly placed upon the ball.

In your "New Metal Worker Pattern Book" there is a problem showing a square shaft mitering concentrically upon a ball, but since in Fig. 3 the center of the shaft is to one side of that of the ball, the pattern of each side would be cut with a different radius. I would like to know how to find the different radii.

Answer.—The principles governing the pattern for the sides of the shaft shown in Fig. 1 of our correspondent's sketches are in reality covered in Problem 73

Figs. 1, 2 and 3.—Reproduction from Correspondent's Sketches Showing Shafts of Different Plan Mitering Upon a Ball.

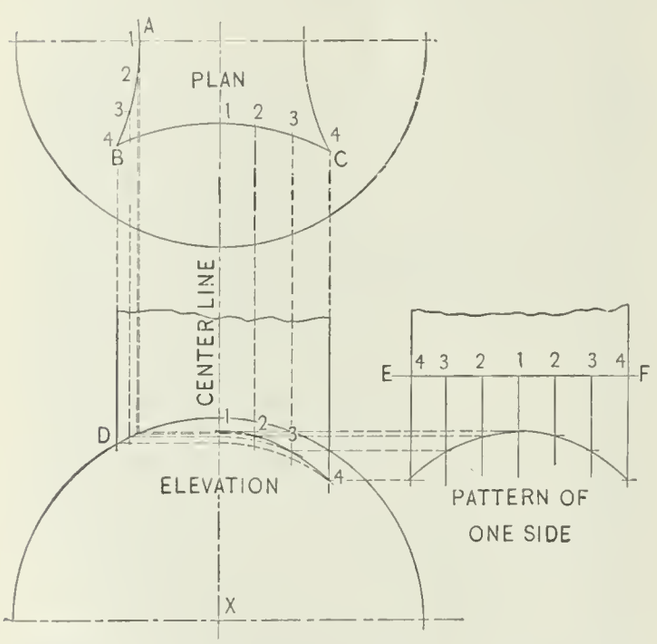


Fig. 4.—Method of Obtaining the Pattern of a Shaft with Concave Sides Mitering Upon a Ball.

of the "New Metal Worker Pattern Book," but as the moldings in the design there shown occupy an inclined position instead of a vertical one, as indicated by the plan in Fig. 1, the application of the method there explained may not be easily made. A simple solution of the problem is shown in Fig. 4. It is first necessary that in either of the demonstrations asked for an elevation be constructed in which the intersection of the shaft with the surface of the ball be shown. Draw first an elevation of the ball, whose center shall be upon the same vertical line as that of the plan, one-half of which only is shown in the figure. Divide one-half of one of the sides of the shaft, as A B in plan, corresponding with that shown in profile in the elevation, into any convenient number of equal spaces; also divide one-half of the front side, B C of the plan, corresponding with that shown in full in the elevation, into the same number of equal spaces, as shown by the small figures. From the points in A B drop lines upon the outline of the ball in elevation, near D, and from the points there obtained carry lines horizontally, cutting the center line of the elevation. Now from the points in B C of the plan drop lines indefinitely across the elevation; then placing one foot of the dividers at X, the center of the ball in elevation, bring the other foot to the several points previously obtained on the center line and draw an arc from each, cutting lines of corresponding numbers drawn from the points in B C. A line traced

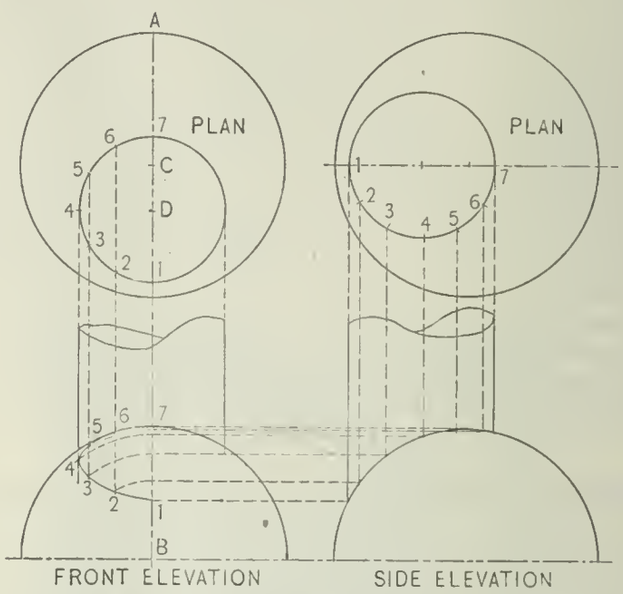

Fig. 5.—Method of Finding Miter Line Between a Round Shaft and a Ball.

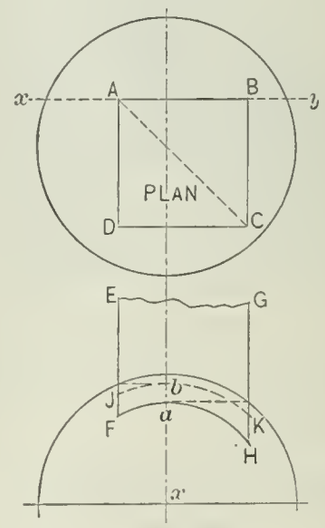

Fig. 6.—Method of Finding the Intersection of a Square Shaft with a Ball.

OBTAINING PATTERNS FOR SHAFTS MITERING UPON A BALL.

through the points of intersection will show one-half the desired intersection or miter line, from which the entire pattern may be obtained.

The method of developing the pattern for one side is fully shown at the right, and as it presents no features not generally understood it will require no further explanation.

The method of obtaining the pattern for the round shaft is shown in Fig. 5. Since the axis of the shaft does not pass through the center of the ball an elevation must first be obtained showing the design as seen in the direction of a line passing through both centers in plan. Therefore first draw the circumference of the ball in plan, and upon a vertical line, A B, passing through its center, C, locate the center of the shaft D, whose distance from C must be equal to the oblique distance between the corresponding points of Fig. 2. Below the

plan and upon the same center line A B construct the front elevation, as in Fig. 4. It will also be necessary to draw a side elevation in line, as shown at the right, which may be projected from another plan so placed as to present its side to view, as showu at the right of the first plan in Fig. 5. The elevation of the miter line or intersection of the shaft with the ball is obtained in the front elevation by first dividing corresponding halves of the shaft in the two plans into the same number of equal spaces, as shown by the small figures. The intersections between the two elevations producing the miter line are obtained in the same manner as between the two halves of the same elvation ln Fig. 4, all of whlch is shown with sufficient clearness in Fig. 5 to require no further explanation. The pattern may be obtained by projections from the numbered points of the front elevatlon in the same manner as that shown in Fig. 4.

In obtaining the patterns for the square shaft shown in Fig. 3 the method described in the problem to which our correspondent refers (Problem 27) is scarcely sufficient. In that problem the face shown in the elevatlon is obtained from one of the outlines, representing a side in profile, because all sides occupy the same relative position with reference to the center of the ball. In the case shown in Fig. 3, since the center of the circle is on one of the diagonals of the square, either two of the sides meeting at one end of that diagonal, as B C and D C, Fig. 6, will be alike and both will be different from the other pair of sides, B A and D A, meeting at the opposite end of the diagonal. Hence the line G H of the elevation may be used ln obtaining the elevation (or pattern) of the front, E F H G, while the line E F may be used in obtaining the pattern of the back, shown by E J K G. Therefore from the intersection of the line G H with the outline of the ball carry a line horizontally, cutting the center line at *a*, and with X *a* as radius describe the arc F H. Then E F H G is the pattern for the two sides represented by D C and C B of the plan. In like manner carry a line from the intersection of E F with the outline of the ball to the center line at *b*, aud with X *b* as radius describe the arc J K, giving the pattern for the sides of A D and A B of the plan.

Should the plan of the shaft be so placed upon the ball that all sides would be different then two elevations would be necessary, so that all sides might be first given in profile as a means of afterward obtaining their elevations or patterns as above described.

To answer our correspondent's final request directly, it may be said that since any plane section of a sphere is a circle the radius for the side of any square shaft cutting the sphere may be found by first extending the line of that side in the plan, as A B, till it cuts both outlines of the sphere at *x* and *y*. Then one-half of *x y* (which is the same as X *b*) will be the radius of the curve to fit against the ball. But ln applying the radius so obtained it is necessary to know the comparative hlght of the two extreme points, as J and K. Otherwise the center from which the arc is struck must be found upon a llne running parallel with the sides of the shaft and at a distance from them equal to the distance of the center line of the plan from A and B.

The Muskingum Valley Steel Company.

At the annual meeting of the stockholders of the Curtis Sheet Steel & Corrugating Company, held in Zanesville, Ohio, last week, the following Board of Directors were elected to serve for the coming year: L. T. Jack, W. L. Kirkland, W. S. Fiscus, James McMahon. W. L. Walker, Geo. S. Phillips and W. S. Horner. By resolution the name of the concern was changed to the Muskingum Valley Steel Company. The Board of Directors met and organized by electing the following officers: L. T. Jack, president; James McMahon, vice-president; W. L. Walker, secretary and treasurer, and W. E. Lloyd, manager. Goff, Horuer & Co., Limited, of Pittsburgh, will represent the company in the market, selling their eutire output of black, corrugated and galvanized sheets. The mill has a large stock of raw material on hand, with orders booked to keep the plant running full up to July.

TIN PLATE WAGE SCALE AGREEMENT.

At a conference which took place on Tuesday and Wednesday of this week between representatives of the American Tin Plate Company and of the Amalgamated Association of Iron, Steel and Tin Workers at the offices of the Tin Plate Company in the Battery Park Building, New York, an agreement was reached which virtually assures the continuance of the existing scale of wages in tin plate mills until July 1, 1903, and obviates the occurrence of a strike or the closing down of the mills this year.

The representatives of the Amalgamated Association were Theodore J. Shaffer, president; John Chappell, vice-president of the New Castle, Pa., brauch of the association; John Quinu, president of the Granite City, Ill., branch; W. G. Price, New Kensington, Pa.; James Saddler, New Castle, Pa.; Edward B. Owen, Martin's Ferry, Ohio; William Freeze, Wheeling, W. Va.; William O'Brieu, Elwood, Ind.; W. J. Williams, Elwood, Ind.; Charles Typper, Niles, Ohio, and John Williams, general secretary-treasurer of the Amalgamated Association. The American Tin Plate Company were represented by W. T. Graham, president, and W. B. Leeds, vice-president in charge of the operating department.

At the close of the conference on Wednesday night the following statement was given out by President Shaffer:

> The American Tin Plate Company, through W. B. Leeds, their first vice-president, asked, before the conferences, that I appoint a committee to meet the representatives of the company. This request being in consonance with our constitution, and similar conferences having taken place with other companies, was complied with. The purpose of the company in calling the conference was to secure, if possible, the uninterrupted operation of their plant during the summer months, when the annual scale is formulated, and means practically a continuous scale. The committee was at first doubtful of its authority to enter into an agreement of this kind, regarding it as the prerogative only of the national convention. Inasmuch, however, as the scale rates offered by the American Tin Plate people are those of the present year and generally satisfactory to our members, and as a precedent has been established in arranging a continuous scale with the Republic Iron & Steel Company, the committee consented, so that there is now an agreement which will prevent the closing of the mills or plant of the American Tin Plate Company, and which will render a strike impossible.

Mr. Shaffer also stated that the matter of recognition and organization of the nonunion mills would be considered at the annual convention of the Amalgamated Association, to be held next month in Wheeling, W. Va., and added: "As a matter of form, this agreement must be ratified by the Amalgamated Association, but there is no doubt that the ratification will be given on the recommendation of the association's regular advisers. The question of wage scale for workers in the so-called 'new process' mills did not come up, but we are ready to take that up at any time."

FLASHINGS.

Gara, McGinley & Co., 23 Seventeenth street, Philadelphia, have prepared a number of circulars in the Spanish language with the object of calling the attention of consumers in Cuba, Porto Rico and Central and South America to their Metal Ceilings, Cornices, Skylights, Roofing Tiles and Architectural Sheet Metal Work generally. The enterprise of the concern in getting up a large amount of advertising matter in Spanish should secure for their goods the attention of the trade in the Latin American countries and our new West Indian possessions. The illustrated circulars are especially attractive, presenting half-tone illustrations of work in the line of Metal Ceilings, Sidings, &c., done by the concern, together with examples in colors of the decorative effects that can be produced in the application of Metal Ceilings and Cornices.

The Conklin Tin Plate & Metal Company, whose incorporation was noted in our last issue, advise us that they will conduct a business both in Atlanta and Savannah, Ga., for the sale of Tin and Terne Plates, Sheet Metals, and Tinners' and Roofers' Supplies generally. The firm are composed of Charles A. Conklin and John M. Goddard.

The Houghton & Buxton Mfg. Company, Worcester

Mass., manufacturers of Steel Stampings, have just completed a large order for Stamped Steel Thread Boards for L. T. Houghton, Worcester, Mass., for shipment to Nagpur, India.

The Marietta Sheet Steel & Tin Company, a new enterprise projected by Laken C. Taylor of Cambridge, Ohio, and others, propose erecting a Sheet Steel and Tin Plate plant upon a site recently secured east of Norwood, an outlying section of Marietta, Ohio. The plant will cost about $150,000.

Frank Brooking & C. L. Hickman are erecting a new Sheet Metal works at Macomb, Ill. The plant will be equipped with modern machinery for the purpose of doing all kinds of work in the Sheet Metal line. Work on the plant will be pushed as fast as possible.

The Berger Mfg. Company of Canton, Ohio, exhibited a fine display of their Classik Metal Ceilings at the annual meeting of the Minnesota Retail Hardware Association last week in St. Paul. The company are leaders in this line and the samples shown represented original designs and varied patterns. Walter E. Voigt was in charge.

The American Tin Plate Company have placed an order with the Bass Foundry & Machine Company of Fort Wayne, Ind., for an engine to be installed in the Laughlin Works at Martin's Ferry, Ohio. The engine will be a cross compound Corliss condensing engine, and will develop 2000 horse-power. The high pressure cylinder will be 28 inches, and the low pressure will be 54 inches, with 60-inch stroke. The engine is to replace an old engine which is to be put out of service on account of being worn out.

The American Steel Company have applied for a charter of incorporation, with offices in the Park Building, Pittsburgh. The new concern will deal in Pig Iron, Steel Billets, Blooms, Slabs, Sheet Bars, &c., and will make a specialty of handling foreign Steel. The concern have already placed a number of contracts for foreign Sheet Bars for delivery in this country. The officers are Eugene S. Reilly, president; P. B. Reilly, vice-president, and M. B. Kelly, secretary and treasurer.

We are officially advised that the report that the Youngstown Iron, Sheet & Tube Company would build mills for rolling Structural Steel is incorrect. This concern will confine themselves to the manufacture of Wire, Iron and Steel Sheets and Pipe, Black and Galvanized. They will make a specialty of double refined puddled Iron Sheets and Pipe.

About April 1 the offices of the Amalgamated Association will be removed from the Bissell Block to the new House Building, Water and Smithfield streets, Pittsburgh.

The Kentucky Iron Roofing & Corrugating Company, Covington, Ky., have been incorporated with a capital stock of $25,000 for the manufacture of Roofing Iron and Siding. The company are erecting a plant, 60 x 200 feet, which will be equipped with latest improved machinery. The machines are being built by George C. Keene & Co. of Cincinnati, Ohio, and will be operated by electricity. It is expected that the plant will be ready for operation by April 1. The incorporators are John C. Droege, treasurer of the Licking Rolling Mill Company; Fred. Macke and J. H. Mersman.

TRADE NOTES.

At a meeting of the Board of Directors of the National Fire Proofing Company, held last week, H. S. Black and A. R. Peacock were elected to fill vacancies on the board, caused by the resignation of J. P. Robbins and C. G. Jones. The new directors represent the interests of the George A. Fuller Company, who became closely identified with the National Fire Proofing Company at their recent organization.

The Pittsburgh Reduction Company have purchased 20 acres of land near the Four Mile crossing, in East St. Louis, Ill., upon which they will erect a factory for the manufacture of Aluminum Wire. The plant will be situated on the Southern Railway, with a connection also with the two belt lines. It will be operated in connection with the company's plants at Niagara Falls and New Kensington, Pa.

"The Story of Human Progress" is the title of an illustrated pamphlet that is being sent out by the Goheen Mfg. Company, Canton, Ohio, in the interest of their Carbonizing Coating, a Paint which is claimed to afford a perfect protection to iron and steel from rust and corrosion. The greater part of the pamphlet is devoted to views of various public and private buildings and other structures on which the Paint has been successfully used, together with *fac-similes* of testimonials from those who have tested the material and found it effective.

C. E. Wenzel Company of Newark, N. J., have been incorporated with a capital of $5000, to manufacture Metal Specialties. The incorporators are C. E. Wenzel, David T. Howell and Francis A. Nott, Jr.

The Robertson Mfg. Company, Buffalo, N. Y., have equipped their factory with modern machinery for the manufacture of a line of hand, foot and power Hero Emery Grinders, also what they claim as the only germ proof Automatic Cleaning Water Filter, made in sizes for homes and public buildings, and other specialties. They will be pleased to receive inquiries from the hardware, plumbing and metal trades, as well as from carpenters and builders.

The Chase Rolling Mill Company, Waterbury, Conn., Brass manufacturers, have increased their capital stock from $500,000 to $800,000.

The American Galvanizing Works, Frank E. J. Pugh, manager, have established works at 1247 Fillmore street, Chicago, corner of Rockwell street, and are prepared to fill orders for galvanized Steel Angles, Flat Bars, Channels, &c. They are also dealers in Galvanized Angles, Bars, Bands, Channels, &c., making a specialty of material for wind mills, and are prepared to make immediate shipment. They have facilities for galvanizing long bars, not to exceed 20 feet. The location of the works enables them to handle their business by rail, saving the expense of cartage.

The Pittsburgh Blue Print Company, 1505 Park Building, Pittsburgh, Pa., are calling the attention of those using large quantities of blue prints to a device which permits of the making of copies of drawings by means of electric light. The device is known as the Cylindrical Electric Copier, and is constructed to meet every requirement that would be made upon it in all its various applications. The frame and angles are of light wrought iron pipe; the base is of iron; the glass in the cylinder is the best plate, and the electric lamp used in connection with the machine is of special design, so constructed as to give uniform intensity of light throughout the process of its operation.

The Graselli Chemical Company, Cleveland, Ohio, have favored us with a copy of an artistically gotten up pamphlet which they are distributing in the interests of their Eureka Soldering Flux. The letterpress of each page is inclosed in an elaborate border in colors. Among the decorations are very striking allegorical representations of the inception of chemistry, the conception of chemistry, the perfection of chemistry, the adaptation of chemistry and the triumph of chemistry. The little publication is of such a strikingly artistic nature as to insure the attention of those to whom it is sent. The company announce that their Eureka Soldering Flux is for sale at their branch offices at 63-65 Wall street, New York City; St. Louis, Mo.; Cincinnati, Ohio; St. Paul, Minn.; Milwaukee, Wis.; Birmingham, Ala., and Baltimore, Md., as well as at their general offices in Cleveland, Ohio. For the convenience of small consumers the company offer Crystal Eureka Soldering Flux in 10-pound cans, which will be shipped by freight or express to any destination.

Dr. Richard Moldenke, secretary of the American Foundrymen's Association, announces that the annual convention of the association for 1902 will be held, on the invitation of the foundrymen of New England, in Boston, Mass., on Tuesday, Wednesday and Thursday, June 17, 18 and 19.

BAD SEWER ARRANGEMENT.

BY J. N. S.

In some small cities or towns where there is no system of sewerage I have found that the general practice of architects has been to locate the cesspool to the rear of any house or building which required one, and consequently the drain pipes would be arranged to run in that direction. The only reason why the cesspool is located to the rear is that it is considered more out of sight there, and in the event of its having to be cleaned it would not be so conspicuous. In some cases no flag stone is placed over the top to show where it is located, but the top of the cesspool is 3 feet under ground, and when it is found necessary to open it digging must be resorted to until it is found. In some instances success attends the very first effort. In placing the opening out of sight it is too often placed out of mind, because its exact location is forgotten when it is necessary to find it.

When cesspools are built it has never seemed to occur to the architect that a sewer might possibly be laid

Bad Sewer Arrangement.

in the street at some later date, otherwise he would have arranged the cesspool in the street in the front of the building. He should also place it where it would be found without any difficulty. A foresighted architect would moreover have planned the piping so as to drain to the front, for the reason that it would be so much easier to connect it to the sewer when it was laid. The cesspool could then be disconnected and filled up with clean earth and the connection with the sewer made. That would be an inexpensive and sanitary disposition of the whole matter. But should the cesspool be at the rear it might mean that the house drain under the ground would have to be dug up and cut out and reconstructed to suit the new requirements. Such an operation would cost money and even though it would be money well spent it should be avoided by the architect who labors for his patron's interest.

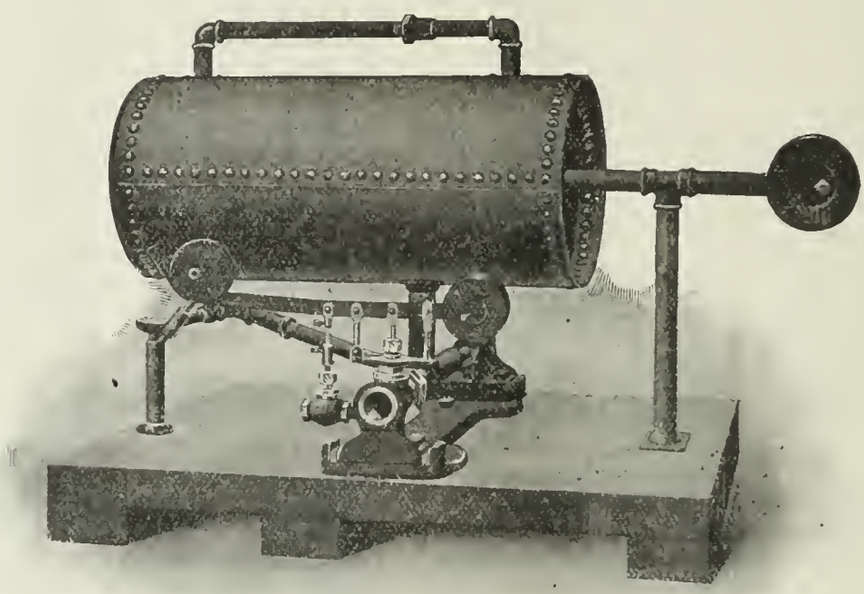
I have read an article by an English author treating on this subject, a part of which perhaps would be worth while repeating here. "To cut out the plumbing and drainage of a house," he says, "and reconstruct such work may be a costly affair, but not so costly, perhaps, as to have to take a sea voyage or go to the mountains or sea shore to recruit one's health after a fit of illness caused by not having your work overhauled or put in good condition. It is better to pay a pipe or drain doctor than the grave digger. It is also better to spend some of your money this way than to allow your executors to spend it for you."

Very often this is not done, or it is done in the cheapest manner possible. I have often found it done in this way: The pipe leading from the house to the cesspool in the rear is cut off and the end cemented up. The cesspool is allowed to remain as it was. Then an earthen bend is cemented onto the pipe, and by means of another bend a loop is formed and the pipe is brought around to the side of the house, as shown in the accompanying sketch, and carried alongside of it to the front, where it is run out and connected with the sewer. Terra cotta pipe is used the entire distance, and the grade may not always be what it should, so that, with the loop, it makes a poor job. In my experience with such cases the loop gets stopped up repeatedly, as it is not able to keep itself clean, on account of the long circuitous route the waste water has to travel, which deprives it of any flushing or scouring force. There is no means of rodding it out, consequently it has to be dug up. This means a pile of dirt to be thrown up on the lawn. The pipe must then be tapped and cleaned out and a patch must be placed over the place tapped.

This, in itself, would not be so bad if, when the pipe got stopped up again the same place could be dug up, the old patch removed and the pipe cleaned once more. But it is ten to one that a new hole will have to be put in the pipe the very next time it has to be cleaned. A few operations of this kind and the sewer pipe becomes a thing of patches. But, to make matters worse, this house sewer starts to leak at the joints and the slimy water works its way into the cellar wall near the floor line, where it can be seen quite plainly. Then, possibly, some one in the house is taken sick and the money that is spent for medicine and doctors' bills would more than pay the difference in the cost of having the work done properly in the first instance. Well, the upshot of the whole thing is that it has to be done right anyway, but it would be cheaper to employ a good plumber or drain doctor in the first place.

The Central Supply Company.

The Central Supply Company, Indianapolis, Ind., purchased the business of McElwaine & Richards, wholesale dealers in plumbers' and steam fitters' goods and electrical supplies, in West Maryland street, taking possession of the property February 24, after they had filed articles of incorporation with the Secretary of State. The new company are capitalized for $125,000. The members are Louis C. Huesmann, William K. Smith, Alice A. Smith, Samuel R. Bell and William S. Wilson of Union City, and Raphael Kirshbaum of Indianapolis, who also own the Knapp Supply Company of Union City, engaged in the same line of business. They will continue in business, both in Indianapolis and Union City. Mr. Huesmann will be president and general manager of the company. McElwaine & Richards have been in business in Indianapolis for many years. They have a factory at Noblesville, which they will continue to operate.



The Sharon Brass Mfg. Company.

A reorganization of the Sharon Mfg. Company of Sharon, Pa., was effected last week. A new company were formed to be known as the Sharon Brass Mfg. Company. The object of the new concern is to enlarge on the operations of the original concern, manufacturing bronze and brass castings, babbitt metal and plumbing goods. The new company are capitalized at $50,000. The plant of the Sharon Mfg. Company, which was taken over, is to be enlarged. The following officers were elected: President, M. O. Shrock; treasurer, John S. Leslie of the Leslie Hardware Company, and secretary, J. L. Merritt of Greenville, S. C. The directors are: S. C. Koonce, Clarksville; R. A. Wilson and T. L. Woodward, Pittsburgh; John S. Leslie, M. O. Shrock and J. L. Merritt.

For some time past two journeymen plumbers' unions have been operating in New York City, but it is now stated that the rivalry has been abandoned. A meeting has been arranged, at which a plan for future operations will be finally adopted.

The Morehead Return Trap.

The condensation from any steam heating or cooking apparatus must be removed. The more quickly the condensation is removed the drier and more effective will be the heating surfaces. It is the greatest extravagance to waste it, as it is pure water and hot. The most effective way to utilize the heat it contains is to deliver it into the boiler before it vaporizes. The Morehead return trap has been designed to handle this condensation quickly and economically. It is constructed of steel, the heads and longitudinal seam being closely riveted and calked, to withstand any pressure carried on the boiler. All working parts are on the outside, in plain sight and easily accessible. The trap is located 6 feet or more above the water line of boiler. The water from the condensing surfaces is forced by the pressure of steam from the boiler through a pipe leading to the trap, with a swing check valve close to latter. As soon as sufficient water has entered the receiver to overcome the weight on the arm the receiver tilts down, allowing the water to pass through the discharge pipe, at the same time opening the steam valve, which has a pipe connected with the dome of the boiler. By equalizing the pressure on the surface of the water in receiver with that in boiler, the water, in simple obedience to the laws of gravity, flows into the boiler. As soon as the receiver is empty it tilts back, as before, and again refills. The trap is prompt in opening and closing, its action being due entirely to gravity. When once set up it requires no further attention. It takes the water from the condensing surfaces, whether they are above or below the water level in the boiler, and automatically returns it to the boiler at the temperature due to the pressure at which the steam is condensed. There is no outlet by which the steam can be wasted. It supplies all the water needed in the boiler from the main pipe, providing there is enough pressure on the main to lift the water to the trap, thus performing the duties of a pump or injector. It operates equally well with high or low pressure coils, or coils using exhaust steam, allowing no condensation to collect in them. This trap is made by the American Blower Company of Detroit, Mich.

The Morehead Return Trap.

H. C. Simmons, North Bennington, Vt., is sending out a very attractive piece of trade literature devoted to the Simmons Heating Boiler. After a brief description of the Boiler and what it is capable of accomplishing, the pamphlet is occupied by a number of half-tone engravings showing fine buildings which have been heated with the Simmons Boiler, including schools, churches and residences. A long list of those who are using the Boilers with satisfactory results in several different States is also given.

A Thawing Apparatus.

The American Heating Company of Boston are reorganizing, and may establish a plant in Worcester for the manufacture of various heating devices in which the principle of a down draft is applied. The company are already placing on the market a street stove for thawing out ground in winter weather, and tests by the Sewer Department of the city of Boston have proved this device to be a success. The same idea will be applied to tar kettles for use in the street to do away with burning of wood in open fire in the street, which causes a good deal of nuisance. The down draft is not a new principle, of course, but the down draft heater invented and patented by Charles Schweizer of Boston has a new idea in its burner or grate. This consists of perforated fire brick, which will not melt at greatest heat, the tendency to melt being the fault of previous burners, because they were of iron. The fire brick becomes incandescent after a time, which it is claimed is caused by the combustion of hydrocarbon and other gases, which in the ordinary updraft fire escape up chimney. The street stove consists of three parts: The stove, which is a sheet iron box with fire brick burners at the bottom; a middle section, which is a long flat box like contrivance, also of sheet iron, and a stack at the further end from the stove. The ground is the bottom of all three. The flame from the wood fuel is sucked down through the grate and acquiring great heat passes along the surface of the ground, in a few hours thawing it to the frost limit. It is claimed for the burner that it can be applied to any stove, boiler or furnace.

Ventilating Ships.

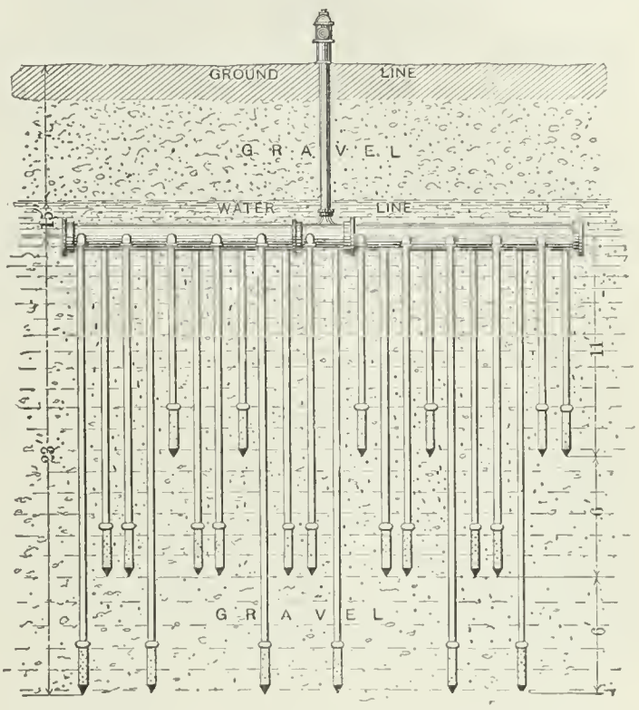
Joseph McCreery & Son, Toledo, Ohio, manufacturers of the McCreery heating and ventilating system, have secured an important contract from the United States Government to install their apparatus in a number of ships. The new battle ship "Maine" is to be equipped with the apparatus which is the invention of the Toledo firm. The McCreery ship ventilating system is coming into general use on the lakes and oceans. The D. & C's. Mackinac fleet is fitted out with the apparatus, as are the recently built ships of the D. & C. and the C. & B. lines. The contract to equip the new "Maine" is necessarily a large one, because of the peculiar construction of a battle ship as compared with vessels belonging to the merchant marine type. A battle ship, because of its vast below water line area and innumerable iron and steel walled compartments, requires an extensive ventilating system, and the work in the "Maine" will involve a considerable expense.

Steam Fitters' Convention.

While it is practically settled that the annual convention of the National Association of Master Steam and Hot Water Fitters will be held at Atlantic City, N. J., the date has not yet been decided upon. There is a strong probability, however, that the convention will be held on June 11, 12 and 13, National Secretary Henry B. Somers being now engaged attending to the final preparations with a view to the date mentioned. The announcement of the time for holding the convention will probably be made at an early date. Should the National Association of Master Plumbers select the preceding week for holding their convention in Atlantic City, doubtless many plumbers and steam fitters will find it desirable to attend the convention.

The Hitchcock Plumbers' Supply Catalogue.

The Hitchcock Supply Company, 72-74 Dwight street, Springfield, Mass., are sending to the trade, in a yellow cloth cover, a catalogue of 834 pages devoted to supplies of every description for plumbers, water works, steam and gas fitters and tinners. The frontispiece is a picture of the four-story brick building which the company occupy, and the title page presents their trade-mark. The introduction calls attention to the extensive line of goods which they carry and their ability to fill orders promptly. Special attention is directed to the convenient arrangement of the catalogue for ordering goods and the use of letters instead of numbers, to aid in avoiding errors. This is followed by a special notice in reference to terms and an excellent index occupying 22 pages.



The catalogue proper opens with iron pipe, both wrought and cast, and all of the many fittings in cast and malleable iron used in connecting it, together with various styles of haugers and ring plates, ceiling plates and adjustable floor thimbles. A section is devoted to flanged pipe of cast and sheet metal and the special fittings used in connection therewith. Another portion of the catalogue is occupied by steam and hot water boilers and radiators, with pipe coils, expansion tanks, registers, regulators, steam traps, injectors, pipe covering and packing, and an extensive line of valves. Hose goods and plumbers' brass work occupy another section, including rough and finished brass work for the laundry, kitchen, lavatory and bathroom, of the lever and compression type and of Fuller construction. These water fixtures are followed by waste fittings, including brass overflows and strainers, wash tray wastes, bathtub wastes and overflows in a variety of styles, lead and nickel plated brass traps, lavatory supply pipes and water closet flush and supply pipes, with all the attending brass fittings, including stall fittings of every character. These goods are followed by a great variety of plumbers' sundries, such as washers, gaskets, Fuller balls, closet connection rubber elbows, &c.

Sixty pages are devoted to porcelain and enameled iron French and Roman pattern bathtubs, seat baths, foot baths and steel clad bathtubs, and a variety of styles of shower baths with receptors. Some 60 more pages show an extensive line of marble and enameled iron lavatories, drinking fountains with their supports, and bathroom fixtures in the form of towel rods, soap cups, sponge holders, &c., followed by 80 pages devoted to water closets, urinals and slop sinks, and an extensive line of porcelain and enameled iron kitchen and pantry sinks. Laundry tubs are also shown in solid porcelain and made of slabs. Galvanized iron and copper kitchen boilers, large hot water storage tanks, with tank heaters, occupy another section. A variety of the simpler forms of gas fixtures and brass fittings are followed by burners, globe holders, tapers and tubing.

Speaking tubes, stove pipe and elbows, ventilators, conductor strainers, corrugated conductor pipe and eave trough and hangers are given in another section. Cellar drainers, soil pipe testing plugs, back water traps, hydrants and hydrant fittings are followed by water meters, tapping machines and an extensive variety of lifters and force pumps and hydraulic rams. Fire pots for plumbers and tinners and an extensive variety of tools are also shown, including pipe tongs, pipe cutters, pipe vises and the catalogue closes with lead pipe, block tin pipe and solders, and the various metals used by plumbers and tinners.

Driven Wells for Fire Purposes.

Janesville, Wis., has a driven well for fire purposes which has proven to be a great improvement on cisterns. It consists of two 12-inch water pipes connected so as to extend in a line and a 5-inch wrought iron pipe all connected to a central T, the wrought iron pipe extending

Driven Wells for Fire Purposes.—Fig. 1.—Elevation Showing Feeders, Main and Service Pipes.

to the surface, as shown in the elevation given in Fig. 1, and on both sides of the water main, or reservoir, points put down at irregular depths, from 10 to 20 feet. The points are driven from 4 to 6 feet from the main, as shown in Fig. 2, which is a plan and in line with the nipple to which they have to be coupled.

Before laying the apparatus the earth should be excavated to the level of the water, where the excavation should be not less than 28 feet long by 14 feet wide. This kind of water supply, says *Municipal Engineering*,

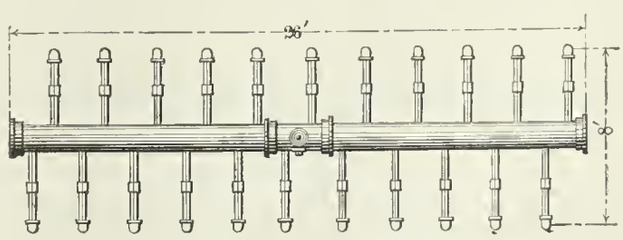


Fig. 2.—Plan Showing Location of Feeders.

cannot be obtained in all localities. The water line must be within reach of the suction of the engine, and the points, no matter how deep they are, must rest in a gravel formation. The placing of the 12-inch water pipe, to which the points are all connected 2 feet below the water line, gives a free flow of water in the pipe under an 18-inch head, faster than any steam fire engine can take it out.

FRED. S. TODD, who for the past 32 years has conducted a Plumbing, Hardware and House Furnishing Goods business in Adams, Mass., announces that he will retire from business and hopes to close out his entire stock by May 1. Mr. Todd is now so situated that he will require considerable time to look after his property and real estate, and his hard work in the past entitles him to the rest and comfort which he can now afford.

A Useful Siphon.

The principle of the siphon—not the article which contains soda water and is frequently associated with the whisky bottle, but the mechanical appliance properly known as the siphon, says the *Ironmonger*—might be employed with advantage much more frequently than is the case. We purpose describing, 1, the principle of the common siphon, and, 2, a particular and useful form which can be easily made by any tinsmith or sheet metal worker. In Fig. 1 we show a siphon, simply an inverted U-shaped tube with one leg longer than the other. Assuming that it is desired to empty a cistern or other vessel which has no outlet at or near the bottom, the short end A is placed therein, and if the water or other liquid can be made to fill the tube a flow from the end C is at once started, which will only cease when the siphon is removed, or when the vessel has been emptied. The action is caused by the force of gravitation. The volume of liquid in the longer end B to C is heavier than the liquid in the short end A and B. When the tube has been filled and the ends are opened, each column of water tends to fall. If both were to do so a vacuum would be created in the bend, a phenomenon which does not occur in nature. The heavier column of liquid has its way, and issues through the end C. This sets up a suction, which acts upon the column A B with a force greater than the force of gravitation, and in the reverse direction. Thus the fluid is drawn up the tube at A and discharged through C until the supply is exhausted.

There are several ways of starting the flow. The easiest is by sucking, and the mouth of the ordinary ironmonger's apprentice is usually capable of all the necessary sucking power. But petroleum, even if it be Alexandra or Strange's A1, has its objectionable features when received between the lips, and a mechanical means of starting the flow is to be preferred.

The simple apparatus shown in Fig. 2 is possessed of the necessary feature. Let the tube be of pure tin, tin plate or brass, the first named for preference, of ¾ inch or 1

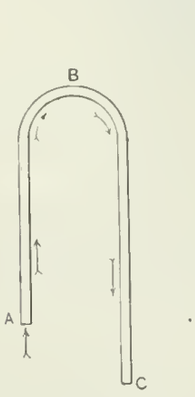

Fig. 1.—A Simple Siphon.

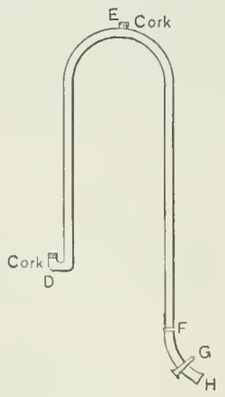

Fig. 2.—A Practical Siphon.

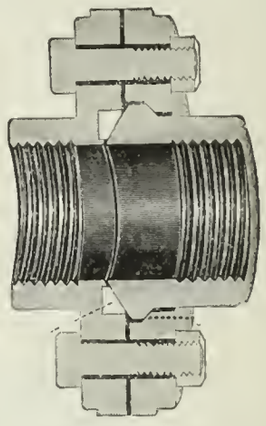
A Useful Siphon.



inch diameter. Return the short end in the manner shown at D, and fit with a plug or cork. At the center of the bend E put another orifice, which also fit with a cork. Provide the discharge end F with a rubber tube of a length to suit the purpose of the syphon, and supply an arrangement whereby this rubber tube may be opened or closed at will. A screw cramp or a straight brass tap will do very well. We have seen a split wooden pin similar to a clothes peg used, and it answered well. Our sketch is intended to illustrate this.

To use the siphon close the rubber tube at G, by the device adopted for that purpose, and insert the cork D. Remove the cork E and, with the help of a filler if necessary, fill the tube quite full of the liquid in the vessel it is desired to empty. Then insert the cork E and remove that at D. The liquid will not issue from D when the latter is opened. The return of the tube prevents this. A similar cause giving the same result may be observed in a common chicken fountain, an Excise ink bottle, or a mercurial barometer. Now the end D must be immersed in the vessel to be emptied, taking care to have the orifice completely covered by fluid. When the rubber tube is now released from the compression which closed it the flow will start, and so long as proper conditions are maintained will continue.

This simple accessory may be employed for many purposes. It will be found particularly useful if an oil cask or tank has become dirty in the bottom. The draw off tap in such a cask or tank is, of course, at the bottom, so that dirty oil will always flow first, although the surface oil may be quite clear. A siphon will remove the oil from the top, after which the dirty oil may be run off into a separate vessel and filtered.

The Jefferson Pipe Union.

The principal feature of the pipe union and flange designed by the Jefferson Mfg. Company of Boston is a ball joint with a bronze seat firmly incased in malleable iron, both upon the inner and outer side. This

The Jefferson Pipe Union.

makes it impossible to force the seat out of place and permits any number of connections, while still maintaining a tight joint. The use of the ball shoulder joint insures the true seating of the parts without reference to the alignment of the pipe. The union is made for high and low pressures and with either brass, copper, lead or iron seats.

Glass Bathtubs.

Bathtubs of glass are being made in Germany and are said to have many advantages over metal and enamel, the principal one being that they are much cheaper. They are also strong. Those being made now are 5 feet 6 inches long, about 2 feet wide and about 2½ inches thick. They are made in a solid piece, and one can be turned out complete in about five minutes. The method of manufacturing glass bathtubs, as described by a contemporary, is very simple. The molten glass is taken from the furnace and placed in a mold, which can readily be swung into any desired position. Compressed air is then admitted through a flexible tube which connects with the bottom of the mold. The air pressure is regulated by valves. As soon as the article is finished it is switched into an annealing chamber, where it is again heated and then allowed to cool. This toughens it, and after the process it is ready for use.

The Work of Health Boards.

Wm. Paul Gerhard, the sanitary engineer, is authority for the statement that "Experience has shown that the control and inspection of plumbing and drainage work by Health Board officials greatly reduce the chances for scamped work and tend to avoid bad layouts, the use of poor material and criminal workmanship. The honest and conscientious workman, as well as the public, are hereby benefited. If the practical work done by efficient health boards were better understood by the public at large it would also be more appreciated.

"Universal appreciation or approval can, as yet, hardly be expected; for, in every community, whether in cities or in the country, persons exist who remain inimical to the efforts made by health officials to improve

the sanitary condition of habitations. But I venture to assert that a greater degree of appreciation of their labors will, in the course of time, be shown by the public wherever health officers and plumbing inspectors perform their work in an honest, fearless and efficient manner."

American Radiator Company.

The annual meeting of the American Radiator Company was held on March 5, when Joseph Bond, Clarence M. Woolley and Charles H. Hodges, the directors whose terms expired, were re-elected, and James B. Dill was elected a director in the place of William H. Hill, resigned. The annual report was presented, disclosing a satisfactory condition of the affairs of the company. It shows net profits from operation for the fiscal year ended January 31, 1902, of $417,614, which compares with $317,997 the previous year.

The common stock shows earnings of over 8 per cent. Following are the figures:

	1902.	1901.	Increase.
Net profits	$627,014	$527,997	$99,617
Dividends	210,000	210,000	.....
Totals	$417,614	$317,997	$99,617

The balance sheet of the company as of January 31, 1902, is as follows:

Assets.

	1902.	1901.
Real estate, plant, &c	$6,625,730	$6,725,730
Depreciation	100,000	100,000
Net	$6,874,174	$6,625,730
Cash	211,439	166,839
Notes redeemable	25,073	60,146
Stocks and securities	.....	6,300
Accounts receivable	1,285,059	1,006,146
Raw material, supplies, &c	944,318	1,036,802
Totals	$9,340,063	$8,901,965

Liabilities.

Common stock	$4,893,000	$4,893,000
Preferred stock	3,000,000	3,000,000
Accounts payable	211,789	191,305
Balance	1,235,274	817,660
Totals	$9,340,063	$8,901,965

President Bond, in his annual report to the stockholders, says:

Prosperity has prevailed in our line of industry in all sections of the country during the past year. There has been unusual activity in the construction of buildings, and we have enjoyed a constantly improving demand throughout the year. Gratifying progress has been realized, not only in the volume of business, but also from important refinements of organization and in all departments. Genuine advancement has been made in cooperative economy in the utilization of our several plants, and abundant provision is being made for the larger demand by the erection of a new plant at Buffalo, N. Y. Each year emphasizes the conveniences and benefits from the varied locations of our plants and branches, and of the great advantages to our patrons from the distribution of the larger volume from the several natural distributing centers, instead of from any one or two or three points. During the past year greater publicity has been given to our products through our advertising department, with excellent results from remote sections, and in fact from all sections.

The foreign business has for some years continued to grow until its proper care and development necessitated the construction of a plant in France, which is in successful operation, and although steam and water heating appliances are thus far used to but a limited extent in that country a good beginning has been made. In Germany it has also been found desirable to construct a plant, which is nearing completion and which will be in operation within a few months, the introduction of American methods of manufacture proving to be the best policy and promising better for the future than any other course.

JOHN KELLY, father of John T. Kelly and W. J. Kelly of the Kelly & Jones Company of Pittsburgh, died suddenly on February 21 at his home in New York City, aged 92 years. Mr. Kelly was for about half a century a resident of Allegheny, Pa., and moved to New York about 12 years ago. He was born in Ireland and came to America when a young man.

ASSOCIATION NEWS.

Michigan Master Plumbers.

The tenth annual convention of the Michigan State Association of Master Plumbers was held at Ann Arbor, on February 26, upward of 75 delegates being present. After transacting the routine business, the following officers were elected for the ensuing year:

President, F. H. Morgan, Detroit.
Vice-President, James H. Quinlan, Ann Arbor.
Secretary, W. I. Holt, Detroit.
Treasurer, J. H. Wheeler, Kalamazoo.

The delegates were entertained at an elaborate banquet, given by the local association.

Ridgewood, N. J., Master Plumbers.

A letter from William P. Morgan, Ridgewood, N. J., informs us that a master plumbers' association was organized at Ridgewood, N. J., on March 1, and the following officers elected:

President, William C. Banta.
Secretary and Treasurer, William P. Morgan.

New York City Notes.

A number of plans for business buildings and hotel apartments are being filed with the Building Department and a few for private houses, as well as some for alterations, but hardly any for buildings coming under the scope of the Tenement House Board. Amendments to the tenement house law are now before the State Legislature, and are said to stand a good chance of passing. Pending the passage of these amendments there is no business doing in the building of tenement or apartment houses.

* * *

Apparently the journeymen plumbers anticipate a good season this year, as there are rumors that they will demand a substantial increase in wages. Judging from the number of men who are now out of a job, and the outlook for increased business, this demand for a possible large increase seems out of place.

* * *

The attack on the "conditional bill of sale" law in the State Legislature will probably be successful. The bill is out of committee and has been ordered to a second reading. The conditional bill of sale, in the absence of an equitable "mechanics' lien" law, gave a large amount of protection to both plumber and dealer in cases where the job looked shaky, and doubtless all the loan interests which fatten on the foreclosure of property and the wiping out of mechanics' liens and interests in buildings are behind the bill to do away with this newly discovered method of protection to the plumber.

* * *

Samuel Schleman, an unlicensed plumber of 63 Mott street, was held in bail for trial by Magistrate Deuell in the Tombs Police Court on Wednesday last for doing work at 16 Pell street. The complaint came from the Law Committee of Manhattan Branch.

Broomell's Patent Vapor System.

The Vapor Heating Company, York, Pa., are sending to the trade a 58-page catalogue devoted to the Broomell patent vapor system for heating buildings with steam. In presenting the second edition of this publication the company call attention to the many fine buildings in which the system has been installed, and point out that it has all the advantages of hot water heating without any weight or pressure in the radiators; that it is noiseless; has no air valves; that each radiator can be wholly or partly heated; that the system is adapted for use with any good boiler and that by the use of smaller piping than is generally used for heating the first cost is re-

duced. The catalogue is illustrated with fine half-tone engravings of many substantial and handsome business buildings and residences in which the system has been installed. General and broken views show the company's special valve and illustrate the ease with which the entire system can be operated. The catalogue treats in a pleasing manner of steam heating, leading up to the Broomell patent vapor system, which is explained in detail so that its features and operation can be readily understood. The last pages contain views showing different methods of piping and give full directions for installing a complete working system. The company agree to render such assistance to steam fitters as will enable them to install the system so that it will work to the best advantage.

Business Men's Championship Bowling Tournament.

The members of the Plumbing and Steam Supply League have decided to enter the Business Men's Championship Tournament, which opens at the Monarch Bowling Alleys, Twenty-sixth street and Sixth avenue, New York, on March 10. The other contestants come from the following leagues: Commercial, Drug Trade, Custom House, Bank Clerks' and Fire Insurance. The Plumbing and Steam Supply League have elected Wm. S. Emery as captain and have selected the following team and substitutes: Regular team: C. W. Grimshaw, A. E. Good, J. S. Dibley, Rollin C. Wilson, W. T. Gilmour, C. A. Blanchard, E. E. Haff, W. S. Gibbs, W. S. Emery and A. Behrer, Jr. Substitutes: Henry Maurer, Jr., E. E. Benas, John F. Hirsch, E. F. Ryder, A. B. Beith, George E. Myers, W. C. Hallett, R. J. Pearson and M. McCormack. The other members of the Plumbing and Steam Supply League may become eligible for a place on the team by good record in practice, and they are invited to meet Captain Emery on the alleys on two evenings every week and every Saturday afternoon.

The Plumbing and Steam Supply League team will meet opposing teams on March 14, 21 and 31; April 11, 18, 22 and 29, and May 9, 12 and 20, when Captain Emery invites a full attendance of members to encourage the team. The social meetings of the trade, which were brought about by the tournament just closed, are looked upon as of great benefit. The new tournament is entered into with spirit and has awakened a wide interest. In the relaxation from the restrictions and cares of business that is enjoyed at the bowling contests many friendships have been established, and many incidents that, under old conditions, would have been annoying have been made amusing by mutual explanations.

Prize Contest.

The Standard Sanitary Mfg. Company of Pittsburgh, Pa., have decided on what should prove a popular method of advancing the sale of enameled bathtubs, sitz baths, lavatories and other sanitary fixtures. They have arranged to distribute $1000 in prizes to plumbers who make the best display of these goods. Those who desire to enter the contest for one of these cash prizes can secure full particulars as to the conditions that must be complied with by addressing the company and securing the little pamphlet which gives the desired information.

Mr. Whipple Gives Sleigh Ride to Children.

William L. Whipple, a well-known plumber and stove dealer in the western section of Providence, R. I., who has made it a custom for many years to give the children of the Tobey Street Home in that city an outing during the sleighing season, has again followed out his laudable custom. The following item from the Providence *Journal* of February 26 gives an account of the outing, which took place last week:

"Through the kindness of William L. Whipple of Providence the children of the Tobey Street Home, 84 in number, enjoyed their annual sleigh ride. Two large sleighs conveyed the merry party through the streets of the city, starting at 1.30 o'clock in the afternoon. It was an outing such as is very seldom enjoyed by the children of the Home, and their exuberant spirits were manifested by singing, blowing of horns and waving of flags. The ride continued until evening and was a thoroughly enjoyable one, the action of Mr. Whipple being decidedly appreciated."

Heating and Plumbing Notes.

An assault on a nonunion plumber by a member of a local union of Memphis, Tenn., brought on an action in court, owing to an injunction which has not been discharged. After hearing the testimony the court decided that the assault in no way affected the injunction and took the opportunity to impress upon the striking members of the union the constant danger of the violation of the injunction. Notice was served that the court would fully protect the rights of the master plumbers as defined by the injunction in the case.

F. J. Lennox has engaged with the Thatcher Furnace Company, 240 Water street, New York, in their steam and hot water department, and will visit the trade in the metropolitan district.

William T. Disley, Waterbury, Conn., has the contract for the plumbing, metal work and roofing for the new building of the Milford Land & Cottage Company.

The Mason Heater Company, Bellaire, Ohio, have contracted with the Dorer Foundry to manufacture their Heaters until their own plant has been completed.

The American Tube & Stamping Company are reported to have secured an option on property in Bridgeport, Conn., where they contemplate the erection of a large Tube works. The project is contingent on securing a franchise from the city of Bridgeport for operating a street railway line between the site of the proposed plant and the yards of the New York, New Haven & Hartford Railroad Company. The works which the company propose to erect will, it is said, employ 2000 men. The capital stock of the company is $2,300,000, with authority to increase to $5,000,000.

George N. Numsen, City Registrar of Baltimore, Md., will receive bids until March 12 for a complete heating plant for the school building at Chestnut and Fourth avenues, in that city.

A fire recently visited the Steam Fitting Supply house of Joseph McWilliams & Co., 323 West street, Louisville, Ky., doing damage to the extent of $5000, which was covered by insurance.

John H. Newbury, plumber, of Bay Shore, L. I., is having a naphtha launch built which he will name "Ida," in honor of his wife, who takes an active part in his business, giving her special attention to the bookkeeping and financial department.

The master and journeymen plumbers of Cleveland, Ohio, are co-operating in an effort to have the City Water Works Department discontinue having certain plumbing work done by its employees. The plumbers hold that they are compelled to take out licenses to do just such work and should be protected by the city.

The Board of Water Works Trustees of Springfield, Ohio, have cited the local master plumbers to appear before them on account of their failing to report work done by them. Through this neglect, it is claimed, the city suffers a loss, people being supplied with water without paying for it.

Caldwell & Co., Sharon, Pa., have secured the contract for plumbing the new house of the Buhl Club in that town. The heating contract has been awarded to McGinniss, Smith & Co. of Pittsburgh.

Green & Co., 723 Massachusetts avenue, Cambridge, Mass., are installing a large Mercer Sectional Boiler in the Green Acre, a large apartment house in that town. They also have a contract for the plumbing, using copper boilers, enameled bathtubs and nickel plated fixtures.

J. N. V. Lane, plumber and gas fitter, has moved into a new store in the Morse-Oliver Building, Bangor, Maine.

Uriah Wardell of the firm of Cox & Wardell, plumbers, died from heart failure, at his residence in

Taunton, Mass., on February 27, aged 63 years. He was a veteran of the late war, and is survived by his wife, a son and a daughter.

J. L. Bowdish, 44 Lower Main street, Oneida, N. Y., advises us that he would be glad to receive catalogues and price-lists from manufacturers and dealers in Plumbers' Supplies.

The plumbing firm of Hoffman, Brown & Wilson, Circleville, Ohio, have secured the contract for heating and plumbing the new residence of S. W. Beal in that place. They are also doing the plumbing in the residences of Clark Timmons, Charles Wright and James Chaffin.

F. J. Johnson of Waveland, Ind., manufacturer of Acetylene Gas Burners, will move his establishment to Anderson, Ind.

Harris Brothers, Oneida, N. Y., have moved their plumbing shop from the Fleishman Block to more commodious quarters on Lennox avenue.

While visiting a friend William Fenton, a steam heating contractor, of 490 Hastings street, Chicago, fell dead from heart disease, at the age of 40 years.

Erie, Pa., is to have a public bathhouse, to be provided with 165 single booths, with a number of larger ones for the use of parties.

The C. F. Sullivan Company, Holyoke, Mass., have two important contracts for overhauling and completely renovating the plumbing in the residences of L. Sears and F. B. Heywood in that city.

S. B. Church, Seymour, Conn., makes a business of constructing towers for supporting water supply tanks and furnishing tanks of all sizes. He is now making a specialty of the construction of sprinkler systems for fire protection in factory buildings. Mr. Church has secured contracts for erecting a 75-foot steel trestle, with a 50,000-gallon tank, for the Cable Flax Mills at Schaghticoke, N. Y., and similar equipment for the Eaton-Hurlburt Company, Pittsfield, and a number of others.

The contract to furnish ten hot and ten cold mills for the new plant of the McKeesport Mfg. Company at McKeesport, Pa., has been awarded to the Wheeling Mold & Foundry Company, Wheeling, W. Va.

The Pittsburgh Seamless Tube Company have resumed operations at their plant at Beaver Falls, Pa., after a year's idleness.

The Lumsden & Van Stone Company, Boston, Mass., manufacturers of Pipes and Fittings, will build a machine shop and foundry at First and L streets, South Boston.

The American Sewer Pipe Company have purchased the old Black mill at East Akron, Ohio, and are fitting it up as a machine shop, utilizing the machinery from the shop at Barberton, Ohio. They will manufacture their own Sewer Pipe machinery.

The Marcy Mfg. Company, Bluffton, Ind., manufacturers of Red Cross Windmills, Tanks, Pumps and Water Works Appliances, have bought a plot of ground, 79 x 140 feet, adjoining their plant, upon which they will build a large brick addition that will double the capacity of their molding room. The machine shop will also be extended. The company have recently completed a building to be used as a galvanizing department. The purchase of this tract of land gives them a large area which they expect to eventually cover with buildings.

The foundry of the Glauber Brass Mfg. Company, at Cleveland, Ohio, was destroyed by fire March 2. The loss is about $50,000.

The City Plumbing Inspector of Nashville, Tenn., is to receive a salary of $1200 a year, and the fee system, heretofore in connection with the office, will be abolished.

The Shaw University of Raleigh, N. C., has received a donation of $15,000 for the construction of a central steam heating plant for heating all of the different buildings.

The Janesville Electric Company of Janesville, Wis., have received a letter from a firm in Dresden, Germany, inquiring about the success of the central station hot water heating plant operated in Janesville.

Alfred Wolstenholme is visiting the trade in New Jersey in the interests of the United States Radiator Company of Dunkirk, N. Y.

King & Snyder are a new firm in the plumbing business at 61 West Milwaukee street, Janesville, Wis. The firm are composed of Charles E. Snyder, who has been for eight years in the employ of McVicars Brothers and George King of the old firm of King & Reichert. A great deal of work has been done in Jefferson and also at Fort Atkinson under Mr. King's superintendence. The firm will also do steam and gas fitting.

Atlas Pipe Wrench Company, 51 Flood Building, San Francisco, Cal., and 121 Liberty street, New York, are the manufacturers of the Atlas Pipe Wrench and Atlas Tube Cleaner. Concerning the Tube Cleaner, they have on exhibition at their New York office samples of the scale removed from boiler tubes through the agency of the Cleaner, as proof of its effectiveness. One of the large sugar refineries which has been testing the device has recently ordered a number of additional Tube Cleaners. The Pipe Wrench is of peculiar construction, having three distinct points of adjustment for varying diameters of pipe.

The Trade Golf Association have been organized at Chicago, with John D. Hibbard, president; J. B. Rahm, vice-president; Chauncey L. Williams, secretary; Paul Blatchford, treasurer, and S. O. Dugger, captain. The first tournament will be held June 24 in connection with the meeting of the Central Supply Association, at Hotel Victory, Put In Bay, Lake Erie.

Several representatives of the plumbing supply trade in New York recently visited Albany to present their objections to the Wilson Assembly bill, which, if passed, would practically do away with the conditional bill of sale now in existence.

John Droz, a member of the Stradling Plumbing & Heating Company, Utica, N. Y., is to be appointed a member of the City Plumbing Board, to succeed himself.

New Firms and Changes.

The Hyde Park Mfg. Company have been incorporated at Portland, Maine, with a capital of $2,000,000, of which $300 is paid in, for the purpose of manufacturing Ventilating Apparatus. The officers are: C. A. Hight, president, and Leroy L. Hight, treasurer.

Becker & Klett are a new firm, at Camden, Maine, in the plumbing, stove, tinware and hardware business.

The Howell Plumbing & Construction Company, 106 Market street, Camden, N. J., have been incorporated with a capital of $5000, by Charles S. Warner, John E. Beatty and Lewis O. Howell, to conduct a plumbing and heating business.

The American Gas Generating Burner Company of New York City have been incorporated with a capital of $500,000. The following are the directors: James R. Mullikin, G. A. Connor, E. F. Morgan, William Sutphen and G. N. Goddard.

The Plimpton & Hills Corporation have been organized at Hartford, Conn., with a capital of $25,000, to conduct a plumbing, gas and steam fitting business. W. T. Plimpton, Raymond Hills and Alfred A. Olds are the incorporators.

The Avery Acetylite Company have been formed at Chicago with a capital of $15,000 by P. C. Avery, G. L. Wilkinson and H. S. Gaither, for the purpose of manufacturing Heating and Lighting Apparatus.

B. A. Adams, who has been in the employ of Dunn Brothers & Co. for a number of years has opened a plumbing shop for himself at 61 West street, Rutland, Vt.

Warnick & Martin are a new firm, at Parkersburg, W. Va., who have bought the plumbing business of W. G. Franklin.

George J. Smith, 140 Dwight street, Springfield, Mass., has sold a half interest in his plumbing and gas fitting business to J. J. Cotter. The firm name in future will be Smith & Cotter.

Robert Curdie, Sr., Robert Curdie, Jr., and Norman Challacombe, have formed a new company to conduct a plumbing and steam heating business at Alton, Ill.

B. P. Stanton & Co. are a new firm in the plumbing business at Memphis, Tenn., composed of B. P. Stanton of the firm of J. S. Stanton & Co. and A. H. Yates. They are located at 318 Front street.

F. D. Harris, for the last 10 or 12 years engaged in the plumbing, hot water and hot air heating and tin roofing business in Onelda, N. Y., has formed a partnership with O. D. Wright, traveling salesman for the Oneida Community, Limited. The firm expect to add to their business that of slate roofing. The new firm will be locatel at 4 Lenox avenue, in a building which will be remodeled to suit their purposes, a new shop being added.

The Prox & Burget Company, consisting of Anton F. Prox and John H. Burget, have opened a store and shop at 829 Wabash avenue, Terre Haute, Ind. They have purchased from the Prox & Brinkham Mfg. Company their steam and hot water heating, plumbing and gas fitting department.

George Haucke, Springfield, Ohio, has added another department to his store. The new venture is a complete Plumbing Supply house, with all adjuncts and a force of competent plumbers. At the present time he is prepared to do all gas and steam fitting.

The American Dowsing Radiant Heat Company, Jersey City, N. J., have been incorporated to manufacture Electric Motors, &c., with a capital of $300,000. The incorporators are Horace S. Gould, John I. Billings, Evan J. Dudley, T. S. Buckingham and Louis D. Dailey.

The J. W. Jordan Company have been incorporated at Worcester, Mass., with a capital of $7000, to conduct a business in Stoves, Ranges, Furnaces, Combination Hot Air and Hot Water Heating and Sanitary Plumbing. The officers of the new company are: Frederick B. Jordan, president; Harris T. Gray, treasurer; Frederick W. Leavitt, director. The other officers are also directors.

The Car Shortage.

The situation as regards the shortage of cars in the Pennsylvania coke regions seems to get worse instead of better. Advices from Uniontown, Pa., state that there has never been anything like the present congestion in that region, both as to shortage of cars and lack of motive power. The conditions have been growing steadily worse for months, until the activity of the regions is practically paralyzed. The workmen are obliged to be idle for two or three days of every week. Even when empty cars can be had on the sidings, all of the coal yards are so full of loaded cars that there is no place to stand the empties. Most of the local concerns are running little more than half time, and the men are making hardly enough to keep their families. Mountains of stacked coke and long lines of filled cars standing on the sidings are now the rule throughout the region. Conditions are as bad for both operators and men as they were during the panic, except that the enforced idleness is caused by lack of transportation facilities instead of lack of orders.

A movement is on foot in Germany, under the leadership of certain members of the Prussian Parliament and officials of the workmen's unions, having for its object the abolition or restriction of night work in factories. The demand will be made that night work shall be unlawful in the case of women or males under the age of 18 years. For adults it is proposed that eight hours shall be the maximum legal period of night labor. It is intended to make these provisions extend to all branches of industry, including workshops, mills and factories, as well as hotels and various forms of traffic and transportation.

Dr. Arsene d'Arsonval of the Paris Academy of Sciences, says a contemporary, has discovered a method of extracting from ordinary petroleum oil a liquid that will not congeal even at a temperature of 205 degrees below zero. This "petrolcum ether," as it is termed, is declared to be of great value, especially in scientific research, permitting the construction of thermometers of a greater precision than any hitherto made. It is also proposed to utilize this material as a cooling agent for refrigeration of dwellings, offices, ships' cabin, &c.

Death of Leonard Lewisohn.

Leonard Lewisohn of the firm of Lewisohn Brothers, New York City, one of the best known men in the metal trade of this country, died in London, England, on Tuesday, March 4, from pneumonia, after a brief illness. Mr. Lewisohn was born in Hamburg, Germany, 54 years ago, and came to this country when 18 years of age as a representative in New York of his father's business. He subsequently became interested in copper mining, and several years ago formed the firm of Lewisohn Brothers, who became one of the strongest in the metal industry. About two years ago this business was transferred to the United Metals Selling Company, who marketed the product of the Amalgamated Copper Company. Mr. Lewisohn was president of the former company until the end of last year. He then continued the firm of Lewisohn Brothers, taking with him two of his sons. Mr. Lewisohn was a director of the American Smelting & Refining Company, and was also interested in a large number of industrial, mining, railroad and financial corporations. He was a member of the New York Stock, Metal and Coffee exchanges. He leaves four sons, Jesse Lewisohn, the eldest, being the active head of the United Metals Selling Company.

The Working Men's College, Melbourne, Australia.

The 1902 prospectus of the Working Men's College of Melbourne, Australia, which has just reached us, a substantial publication of 128 pages, profusely illustrated and well arranged, gives full particulars of the extensive line of work in technical, trade and commercial education that is being carried on by that valuable institution. The statistics show a total of 2160 pupils enrolled in the various classes in the year 1901. During the past year nearly $10,000 were spent in machinery and equipment for the new workshops erected in 1900 at a cost of about $25,000. The trade school department of the college embraces classes in carpentry, sheet metal working, plumbing and gas fitting, printing, carriage building, turning and fitting, blacksmithing, metal founding, house and sign painting, graining and marbling. Civil, mechanical and electrical engineering, architecture, chemistry, mining and metallurgy and agriculture are other subjects in which instruction is provided. The courses extend over periods of two or three years, and the year is divided into four terms.

The preliminary census report of the manufacturing industries of New Jersey shows a total capital invested in such industries of $503,824,082, an increase of nearly 101 per cent. from 1890 to 1900. The value of manufactured products in 1900 is placed at $611,728,933, an increase of almost 73 per cent. There were in 1900 15,481 manufacturing establishments in the State, an increase of 68 per cent., and 241,581 wage earners, an increase of 101 per cent. The total wages paid in 1900 amounted to $110,088,605, an increase of almost 33 per cent., while miscellaneous expenses increased 131 per cent. to $42,640,143, and the cost of materials used was $360,941,870, an increase of 91 per cent.

Commenting on the announcement that the London General Omnibus Company have given out a contract for the lighting of their vehicles by means of acetylene lamps, a cockney poet, quoted by the *Ironmonger*, perpetrated the following quatrain:

"With omnibus companies—big ones, I mean—
The acetylene lamp something novel, of course, is.
But the 'pirate' 'bus owner, they tell me, has been
For ages employing a set o' lean horses."

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

HEATING WATER WITH STEAM.

From C. A. G., Haverhill, Mass.—Will *The Metal Worker*, or some of its readers, give me information as to the amount of steam pressure needed to heat a 40-gallon boiler, by inserting a steam coil made of ¼-inch pipe and consisting of four pipes? Will the condensation be great after the water has been heated to 125 or 150 degrees. When the water has reached a temperature of 200 to 210 degrees, will there be much, if any, condensation? Would the tax on the boiler be equal to a 75 or 100 foot radiator placed in a room?

Answer.—A pressure of 5 pounds will heat the water, and, naturally, after the water has been raised in temperature, the condensation will be reduced and will be less as the water approaches the temperature of the steam. The tax on the steam boiler will depend on the amount of hot water drawn off and cold water entering the hot water tank, but under ordinary use it will be about as mentioned.

RECEIPT FOR COPYING PREPARATION.

From Interested Reader, Cincinnatus, N. Y.—Can you give me, in the Letter Box, receipt and directions for making the preparation used in a hectograph, or a receipt for a coating which is put on the paper in a duplicating process, similar to the hectograph, only the negative is made directly on the coated paper instead of on the gelatin pad in the pan? I should also like to know how to make black copying ink.

Answer.—The coating on paper for hectograph transfer should be made of the same material as the hectograph pad, but to be applied by dipping the paper or passing it through the gelatin solution while it is hot and laying the charged paper on a flat board or glass to cool and to give it time to set. For the composition use the proportions of 1 ounce of the best white glue—Cooper's gelatin preferred—add 6 to 7 ounces of white glycerin, more in winter than in summer. Soak the glue or gelatin in water overnight to thoroughly swell it, pour off the excess of water, add the glycerin and heat to near the boiling point, and carefully stir until the water is evaporated. Add 20 drops of oil of cloves to prevent molding, if to be kept for a time. When the solution is clear of bubbles and hot, dip the sheet of paper into and through the solution, or, by care, one side of the paper may be passed over and in contact with the solution and laid flat, so that the solution will harden evenly on the surface; or the solution may be painted on the paper hot with a brush. When paper is to be used for copying it should be quickly wet with a damp sponge and allowed to nearly dry. The ink is prepared by dissolving 1 ounce of aniline violet or blue in 7 fluid ounces of hot water, and, on cooling, adding 1 ounce of alcohol with ¼ ounce of glycerin, a few drops of ether and 1 drop of carbolic acid. For a black use "Nigrosine" (aniline black), as above.

TEMPERATURE OF STEAM.

From H. F., Washington Depot, Conn.—Does the temperature of steam in a boiler increase with the pressure, and if so please give me the rule for ascertaining the temperature at any given pressure. Is the temperature of the water at the bottom the same as the steam at the top?

Answer.—The temperature of steam increases with the pressure. A table of the temperature at different pressures is given in many of the trade catalogues, and will be found in any steam engineering handbook. The steam in a boiler is always at a slightly higher temperature than the water in it.

THAWING CONDUCTOR PIPES.

From W. H. Regner, Marshalltown, Iowa.—A successful and cheap method of thawing conductor pipes which I have thoroughly tested may be of some interest to some of the readers of *The Metal Worker*. Fig. 1 shows a building with the eave trough and conductor pipe with a 1¼-inch wrought iron pipe placed inside of the conductor for this purpose. This iron pipe is arranged so that no water can get on the inside of it. This is accomplished by letting the top end of the iron pipe extend above the eave trough and then covering it by means of a hood. It is raised to sufficient hight to prevent the water from the roof overflowing it. I have used this method successfully by making a small 8 x 8 inch sheet iron fire pot with a 1¼-inch flue to fit on the bottom end of a 1¼-inch pipe and connected with it as shown in Fig. 2. The heat generated in the fire pot circulates through the 1¼-inch pipe, and there is no diffi-

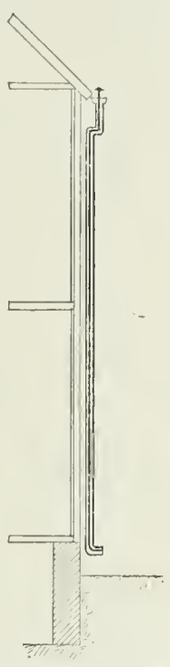


Fig. 1.—System Arranged for Use.

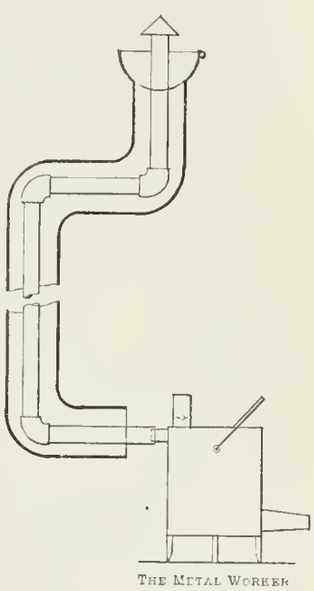

Fig. 2.—Enlarged View showing Heater.

THAWING CONDUCTOR PIPES.

culty in thawing out the ice, however thick it may have become. If it is to be used generally I would advise the use of a larger conductor pipe, otherwise the water carrying capacity is considerably reduced.

WHERE SHOULD VACUUM VALVE BE PLACED?

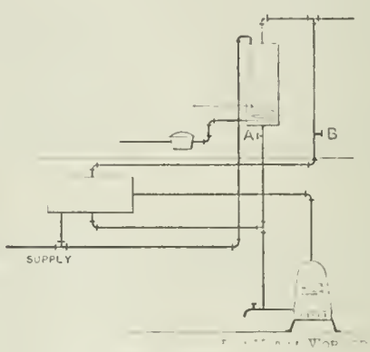
From M. P., Paterson, N. J.—I have read the letter of "F. E. J.," in *The Metal Worker* of March 1, and would present my views on the subject as follows: A vacuum valve is placed on a boiler for the purpose of preventing the water being siphoned out of it from any cause. If it is connected to the supply pipe by means of a tee, as shown in the sketch given with "F. E. J.'s" article, it will break the siphonage, whether there be a hole in the tube in the boiler or not. If it was located at the stop cock on the supply pipe it would break the siphonage in the same way, but I would prefer having it connected at the top of the boiler.

In reference to the second question, I am decidedly of the opinion that siphonage cannot be stopped by means of opening the hot water faucet at the sink. If there is no hole in the delivery tube and it fits tighly into the supply connection, or is soldered fast to the spud, as is sometimes the case, air could not enter the crown of the siphon under such conditions; consequently the siphonage would continue until air could enter the bottom of the short leg of the siphon or the delivery tube in the boiler.

From D. F. N., New York.—In answer to the question of "F. E. J.," in *The Metal Worker* of March 1, I

would say that he is quite right in placing the vacuum valve, as shown in his sketch, at the top of the boiler, so as to break siphonic action immediately. I would further say that very little relief would come from opening the hot water cock at the kitchen sink, as can be proved by placing a bent tube or a piece of rubber hose in an open pail of water. The whole pail being open would afford quicker relief than if it was a tight covered pail with an open pipe leading into it, as in the case of opening the hot water faucet at the sink. In case of a vacuum being created in the boiler, then opening the hot water cock would relieve the boiler very quickly, admitting air to fill the vacuum and prevent the boiler from collapsing. The latest method of avoiding siphonic action is the provision of a hole in the boiler supply tube, for the reason that the vacuum valve is likely to get stuck now and then.

POOR DRAFT IN STONE CHIMNEY.



From James Wood, Noroton, Conn.—In *The Metal Worker* of January 18 "F. H. W." wants to know how to cure a poor draft in a stone chimney. He does not state whether there are any hills or houses in the vicinity to affect the draft, neither does he state whether the boiler works when there is no wind or what winds trouble him the most. During the many years that I have read *The Metal Worker* I have noticed that numbers of people want to know how to cure poor draft and that they have received much advice. It is a difficult matter to make a chimney work if there is an open fire place in the parlor or other room connected with it. When the fire is made of green wood there is no smoke in the room, but just as soon as a door or window is opened the smoke will rush out into the room. This may also be caused when a woman walks past the fire place, as the movement of air caused by her walking will draw the smoke into the room for a few seconds. This back draft has caused many a mason and tinner to lose a night's rest in endeavoring to discover a remedy. In olden times flues were made large and the people had very little trouble with the draft. Now most of the trouble is due to the fact that the flues are made too small. A contractor will build a chimney, and it will possibly work for a year, when it will give him trouble. Then experiments begin without success, and he may rebuild the chimney on the same lines, after which he seeks information wherever he can get it, and is advised to put a chimney top of some character upon it. The top will work all right until worn out.

I would suggest to "F. H. W." that he be careful to select the right kind of chimney top. I have cured many chimneys where others have failed, and feel confident that I can succeed in making his chimney operate. Last year I contracted to cure seven chimneys in New York City. I succeeded in curing six in short order, but the seventh gave me trouble. The building was of brown stone, six stories in hight, and located not far from Fifth avenue. When the owners found me having trouble with the seventh chimney they chuckled to themselves and thought that I faced failure. But I stuck to my task and finally cured the trouble. The flue of this chimney was 14 x 11 inches and attached to it was a steam heater having an 18-inch smoke pipe, a heater for hot water for domestic purposes with a 6-inch smoke pipe and also a Rider engine which has a 6-inch smoke pipe. Nevertheless this chimney now operates satisfactorily.

A condition to which I would call the attention of your readers is the accumulation of gas when fresh coal is heaped on the fire by the janitor. When there comes a sudden change in the weather, even if the smoke pipe was 18 inches in diameter, if the flue was 14 x 11 inches the gas from the coal will be generated so quickly that it will accumulate in the chimney and the wind blowing on the outside will hinder its escape. Then if the inmates of the house are startled by the smell of gas and there is an explosion of more or less violence in the cellar there is no occasion for surprise. A similar condition is brought about frequently by placing a large flag or other obstruction on the top of the chimney to keep the rain water out, instead of using a suitable chimney top. I have no desire to pose as the only successful chimney doctor, but would like to have a chance to try the chimney of "F. H. W." if he has not already found a remedy. If he has I hope that he will describe it for the benefit of the readers of *The Metal Worker*.

A PROBLEM IN BOILER CONNECTIONS.

From I. S. H., Scranton, Pa.—Having read the letter of "B. H. C." in *The Metal Worker* of March 1, I present a sketch herewith, which is my suggestion of how the piping should be run. According to the drawing of "B. H. C.," the upper boiler is supplied with water through the lower boiler, consequently a branch supply pipe will be needed to connect with the upper boiler. The hot water service pipe from the lower boiler should be connected with the hot water service pipe from the upper boiler, and a valve should be placed on it at B. The pipe from the bottom of the upper boiler should have a valve on it at A, and should be carried down and connected with the pipe from the bottom of the lower boiler. Then when the upper boiler only is in use both the valves, A and B, may be closed. This will furnish hotter water

A Problem in Boiler Connections.

than if these valves were open. If they were open the water would rise out of the top of the upper boiler, and when it did not run off through the main service pipe it would fall through the pipe having the valve B on it and flow into the lower boiler. The cold water in the lower boiler would find its way up through the pipe having the valve A on it to the upper boiler to keep up the circulation.

I am afraid, however, that this circulation would be sluggish and that very little hot water would reach the lower boiler. On the other hand, if the steam was shut off from the water heater in the upper boiler and the fire was run in the little heater connected with the lower boiler, the circulation would be up through the pipe having the valve B on it, and could either flow to the fixtures or into the upper boiler and return through the pipe having the valve A on it and run into the lower boiler to be reheated. This would not make any very considerable change in the present piping, and in all probability would be as satisfactory as some more elaborate piping system. I present this for the benefit of "B. H. C.," and hope that other readers of *The Metal Worker* will comment on my system, or suggest others that they consider better, for the benefit of all who are interested in this branch of work.

CAN ALUMINUM CASTINGS BE SOLDERED?

From I. E. D., Atlantic, Iowa.—In answer to the inquiry of "E. S.," in *The Metal Worker* of February 22, I give the following aluminum solder, which I have used with satisfactory results: Mix block tin and sheet zinc half and half. Use as a flux rosin or paraffin wax. I think this will answer his purpose, as I solder common aluminum ware very readily with this compound.

HEATING CAPACITY OF A FURNACE PIPE.

From W. W., New York.—In a case of emergency would a 6-inch round tin hot air pipe, placed in a 7 x 7 terra cotta lined flue, be of sufficient capacity to heat a room 15 x 12 feet in a frame house having a bay window and exposed on two sides? If not, would not two such pipes and flues, joined at the top and bottom, work satisfactorily when both are perpendicular?

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is firm and slightly higher, but dull.

Copper is quiet and unchanged.

Pig Lead is unchanged.

Spelter is dull aud without change.

Antimony shows no change.

Nickel is in good demand at former prices.

Aluminum is active and without change.

Tin Plates are firm and quiet.

Sheets are very strong aud demand urgent, on prospect of scarcity.

Sheet Copper is in good demand, and firm in price.

Scrap Iron is high in price, and in large demand.

Old Brass and Copper are moving freely, and are firm in price.

Foundry Iron is very strong, with high premiums for early deliveries and prospect of scarcity.

Hardware is moviug iu good volume, and prices, as a whole, show strength and steadiness.

Wrought Iron Pipe has been advauced in price 10 per cent.

Roofing Felt is active and strong, with tendency to advance.

Wire Nails are firmer and in better demand.

Cut Nails were advanced 5c. per keg for March.

Window Glass is uusettled.

White Lead is steady, with increased demand.

Linseed Oil is firm aud unchanged.

Spirits Turpentine is quiet but firm.

METAL MARKET.

NEW YORK, March 7, 1902.

Pig Tin.—Business in the Pig Tin market has been extremely quiet. The consumptive demand is light and speculative interest almost entirely absent. The market has advanced somewhat during the week, largely as the result of the stranding of the Steamship "Acara" from Singapore with about 5050 tons of Ore. Late reports, however, state that this cargo is likely to be recovered eventually. Jobbers' quotations for small lots of Straits Pig are about 26½c. to 27c. per lb. The total visible supplies, as compared with a month and a year ago, as compiled by the New York Metal Exchange, show:

	Tons.
Total visible supply February 28, 1902	17,043
Against visible supply January 31, 1902	18,351
Against visible supply February 28, 1901	17,016

Copper.—This metal has continued in a dull and uninteresting condition. The market appeared to soften during the early part of the week, but put on a better tone at the close. The demand from consumers has been extremely light, while holders are showing considerable willingness to sell. Jobbers' prices are unchanged, Lake Ingot in small lots beiug quoted at about 13¼c. to 13¾c. per lb., and Casting Copper at about 13¼c.

Sheet Copper.—The demand for Sheet Copper is referred to as of good volume, indicating a prospect for a large cousumption of the material this season. Prices rule firm on the basis of 18c. per lb. from store.

Pig Lead.—This metal is entirely unchanged. Business in this, as in other lines, has been hampered to some extent by the storms which have delayed deliveries from the West. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. St. Louis advices report that the Pig Lead market at that center has lapsed into a quiet condition, although prices hold firm and steady.

Spelter.—Dullness characterizes the metal in this market. Demand is very light, and there is no pressure of offerings. Prices are unchanged, good Western brands in small lots being quoted at 4.60c. to 4.70c. per lb. St. Louis advices indicate a materially lessened demand for Spelter in that market, with very quiet conditions ruling and no change in price.

Sheet Zinc.—The demand for Sheet Zinc keeps up to about the average volume. Jobbers quote 600-lb. cask lots at 6¾c., and smaller quantities at 7¼c. per lb.

Antimony—Is unchanged. Hallett's is quoted at 8⅝c. to 8¾c. per lb. for small lots; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—No change is noted in this market, small lots being quoted at about 55c. per lb.

Aluminum.—A good demand for this metal is reported. Prices remain at former level. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c. per lb.

Tin Plates.—The Tin Plate market presents a quiet and uninteresting aspect. Deliveries on old contracts are said to be heavy, but comparatively little new busiuess is reported. Some of the canners and Can makers still seem to be hesitating about placing their season's orders. The retail demand has been restricted during the week by the inclement weather, which has prevented out of door work and hampered communications. Prices are without change. American Bessemer Plates, IC, 14 x 20, in small lots, at New York and corresponding points, are selling at about $4.85 to $5 per box.

Sheets.—A heavy demand is noted for both Black and Galvanized Sheets. On account of the great difficulty experienced by some of the outside mills in getting Sheet Bars, it would not be surprising if prices of Sheets would advance when the spring trade opens actively. Deliveries throughout the country have been delayed by the interruption of floods. Most of the Sheet mills are understood to be sold up for the next three or four months. Prompt deliveries command slightly higher prices than contracts for extended shipment. Retail prices in this section are very firm. No. 27, One Pass Cold Rolled Soft Steel Sheets, beiug quoted in New York at 3.90c. to 4c., and Galvanized Sheets at 67½ and 5 per cent. to 70 per cent. off the list.

St. Louis advices are as follows: Busiuess in the market for Sheets of all grades is said to be of large proportions, and prices are on a firm basis. Jobbers quote Stove Pipe size, No. 27, at 3.60c. to 3.65c., and Galvanized Sheets, 70 to 70 and 5 off in round lots.

Old Metals.—Demand for Scrap Iron is still heavy and prices are strong. In other lines of Old Metal a good business is also being doue. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10¾c.
Light and Tinned Copper	per lb. 9 c.
Heavy Brass	per lb. 8¾c.
Light Brass	per lb. 6¼c.
Lead	per lb. 3⅝c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 3 c.
Pure Aluminum, Sheet	per lb. 25 c.
Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 15¾c.
No. 2 Pewter	per lb. 8 c.
Tin Plate Scrap, per gross ton	to $5.00
Wrought Iron Scrap, per gross ton	$13.50 to 14.00
Heavy Cast Scrap, per gross ton	12.50 to 13.00
Stove Plate Scrap, per gross ton	9.50 to 10.00
Burnt Iron, per gross ton	7.00 to 7.50

THE PIG IRON MARKET.

NEW YORK.—A number of sales of magnitude have taken place in this market. Some of the Northern furnaces have further advanced prices. We quote for Northern Irons: No. 1, $18.50 to $19; No. 2 X, $17.50 to $17.75; No. 2 Plain, $17 to $17.50, at tidewater; Tennessee and Alabama brands, No. 1 Foundry, $16.50 to $17; No. 2 Foundry, $16 to $16.75; No. 1 Soft, $16.50 to $17; No. 2 Soft, $16 to $16.50; No. 3 Foundry, $15.50 to $15.75; No. 4 Foundry, $15 to $15.50.

PHILADELPHIA.—There is no market in the ordinary sense of the word, consequently prices are almost impos-

sible to quote. Makers who have little Iron to spare can control their prices, and as a matter of fact buyers are not disposed to haggle about prices provided they can get material quickly. The continued strength of the market for the first half of the year has had a tendency to strengthen the feeling in regard to later dates, and while the Southern Ironmasters have not withdrawn from the market, they are certainly less free in their offers than they were a week or ten days ago. It may be said that the feeling all around is considerably stronger than it was a week ago, and it is not unlikely that present prices may average an advance of $1 per ton. A good deal depends, however, on deliveries. For the present the range of prices would be about as follows for city and nearby deliveries:

	Delivertes to July.	Delivertes July to December.
No. 1 X, Foundry	$19.25 to $20.00	$18.50 to $19.00
No. 2 X, Foundry	18.50 to 19.00	17.00 to 17.50
No. 2 Plain	17.75 to 18.25	16.50 to 17.00

PITTSBURGH.—The market has quieted down somewhat, and large purchasers of Pig Iron are using their utmost endeavors to hold the market where it is and keep prices from advancing. No. 2 Foundry Iron is quoted at $17 to $17.25, and No. 1 at $17.50 to $18, f.o.b. Pittsburgh.

CINCINNATI.—The amount of Pig Iron sold during the past week was comparatively small, and sellers are expressing themselves as glad of the change to make it easy for a short season. The amount of inquiry and especially for late deliveries has also very materially decreased. Prices are stationary. There are a few sellers asking and doing some little selling on basis as high as $13, Birmingham, for No. 2, but the real mark is on the basis of $12, with the exceptional grades at $12.50. The present lull is generally expected to last a week or two at least. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$15.25 to $15.75
Southern Coke, No. 2	14.75 to 15.25
Southern Coke, No. 3	14.25 to 14.75
Southern Coke, No. 4	13.75 to 14.25
Southern Coke, No. 1 Soft	15.25 to 15.75
Southern Coke, No. 2 Soft	14.75 to 15.25
Southern Coke, Gray Forge	13.75 to 14.25
Southern Coke, Mottled	13.75 to 14.25
Ohio Silvery, No. 1	17.75 to 18.25
Ohio Silvery, No. 2	17.25 to 17.75
Lake Superior Coke, No. 1	18.10 to 18.35
Lake Superior Coke, No. 2	17.60 to 17.85
Lake Superior Coke, No. 3	16.35 to 16.85

ST. LOUIS.—Sales in the Pig Iron market during the past week are somewhat lighter in volume, but the inquiry for quick delivery Iron continues to be quite pronounced and the offerings light. All of the Southern furnaces are practically sold up for the first half of the year, and many are heavily booked beyond that period. The severe floods in many sections of the South have greatly hampered plants and shipments have been delayed. Prices are on a firm basis, and we quote for cash, f.o.b. St. Louis, as follows:

Southern, No. 1 Foundry	$15.75 to $16.00
Southern, No. 2 Foundry	15.25 to 15.50
Southern, No. 3 Foundry	14.75 to 15.00
Southern, No. 4 Foundry	14.25 to 14.50
No. 1 Soft	15.75 to 16.00
No. 2 Soft	15.25 to 15.50

CHICAGO REPORT.

Scrap Iron and Steel.—Business is quiet in the Scrap Iron market and no change in prices since last week. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	13.00 to 13.50
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	7.00 to 8.00
Sheet Iron and Hoops	8.00 to 8.50
Plow Steel	11.00 to 11.50
Breaking Stock	.... to 11.00
No. 2, such as Shovels, Hocs, &c	7.00 to 7.50
Old Boilers—whole (Iron)	9.00 to 9.50
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	6.50 to 7.00
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—A fair demand continues and prices are maintained, with a slight advance in some metals. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	11 c.
Copper Clips	10 c.
Red Brass	11½c.
Yellow Brass	8 c.
Red Brass Borings	9 c.
Yellow Brass Borings	7¼c.
Light Brass	6 c.
Pipe Lead	3.50c.
Tea Lead	3.25c.
Zinc	2.90c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.
Aluminum	20 c.

Old Rubber.—Conditions remain about the same, with a good demand and prices strong. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	7 to 7½c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6½c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—Market is very quiet, as the weather is still moderate. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE HARDWARE TRADE.

The prevalence of severe weather has in more than one way interfered with the transaction of business during the week under review. Besides the interruption of the ordinary outdoor occupations, which has the immediate effect of diminishing the volume of business throughout the country, there has been uncertainty and delay in the movement of passengers and freight, with corresponding interference with connection by mail or telegraph. The extent to which production is being interrupted cannot as yet be definitely estimated, but it is evident that the matter is a serious one for many plants whose operations have been stopped by the high water, with injury in some cases to their outfit or manufactured products. It is not unlikely that in this way some of the mills will be put still further back in the work of filling orders, thus accentuating the difficulty in obtaining raw material or finished goods. While these influences will have a depressing effect so far as the immediate business of the country is concerned, they tend to give indirectly firmness to values and to strengthen the situation so far as the future outlook is concerned. The changes in the price of Hardware and related products are unimportant. A few goods are from week to week being advanced and the general tone is steady and confident. The subject of consolidation continues to be a trade topic in a serious or speculative way. The recent consolidations in Axes and Builders' Hardware are being canvassed in the light of the advantages thus secured by the parties whose interests are immediately affected, and the wisdom of the action taken is generally conceded. The qustion as to how much further in this or in other lines the movement may go is regarded with a good deal of interest by the trade, especially as it is understood that negotiations to have certain lines of Edge Tools taken in with Axes are in progress. Meanwhile the trade recognize the fact that in practically all the lines in which consolidation has been effected one of its results has been the development of competition, so that the elimination of competition by this means is apparently as remote as ever.

NOTES ON PRICES

Wrought Iron Pipe.—On March 1 the price of Wrought Iron Pipe, Black and Galvanized, was advanced 10 per cent. While no official discount sheet has been issued up to the present time, it is understood that all extras have been lopped off and that the pres-

ent Pittsburgh basing price on Wrought Iron Pipe for jobbers' carloads is as follows:

Size.	Black. Per cent.	Galvd. Per cent.
⅛ to ½ inch	62	50
¾ to 12 inch	69	57

These are the base discounts f.o.b. Pittsburgh, Pa. These, we are told, are the prices at which the National Tube Company are making sales at the different plants operated by them. The new base discounts show an advance of 10 per cent. upon the previous mill prices, which have been in effect since September 1, 1900. At the time the base discounts were adopted there was no extra rebate allowed by the then controlling interest, but as time went on and one independent mill after another went into operation, until the independents represented some 65 per cent. of the output of Pipe, they were compelled to adopt a more liberal selling policy. At the present time the market would be in the hands of the independents were it not for the fact that control of the market for raw material is in the hands of the United States Steel Corporation, who are keeping prices for Skelp at such a high level that it will be impossible for the outsiders to cut prices very much.

At a meeting of the New York jobbers held on March 4 the following local prices on Wrought Iron Pipe were adopted:

	Black. Per cent.	Galvd. Per cent.
⅛ to ½ inch	60	45
¾ to 12 inch	67	55
Extra Heavy Pipe, plain ends	50	40
	Per cent.	
Double Extra Heavy Pipe	20	

To cover sales from stock in Greater New York, Long Island and for export.

Roofing Materials.—The season has opened with prospects of large trade in Roofing Materials. The demand is referred to as active and prices are very strong with tendency to advance, especially in the line of Roofing Felts.

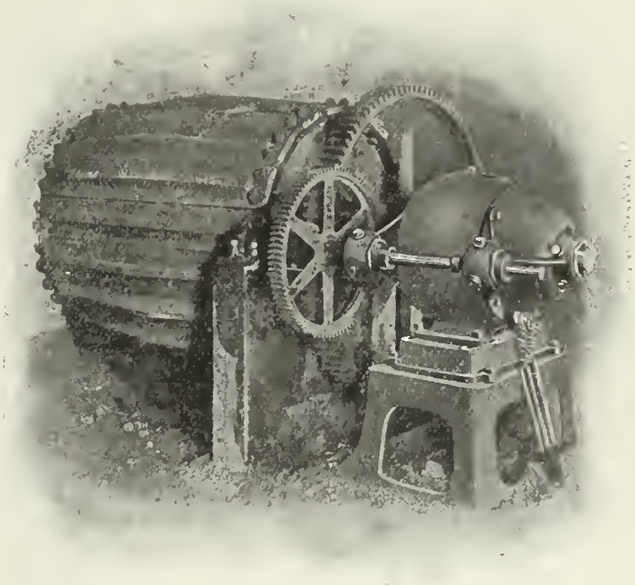
Wire Nails.—An improvement in the demand for Wire Nails is reported in the New York market and prices show increased firmness. Small lots from store are quoted at $2.25 to $2.30 per keg. High water has seriously interfered with the production of Nails at some of the mills.

Cut Nails.—The meeting of the Cut Nail Association, held March 4, advanced prices 5 per cent. for the month of March. Cut Nails are meeting with a comparatively light demand in the New York market, where small lots from store are quoted at $2.20 to $2.25 per keg.

Window Glass.—Both the large and small trade are ordering only sufficient stocks for immediate needs, owing to fear of lower prices later in the season. The quotation of the Jobbers' Association for Window Glass from store is 90 and 10 per cent. discount.

White Lead.—Orders for March and forward delivery for White Lead in Oil are reported to be increasing, and the market is somewhat steadier. A satisfactory demand is anticipated for the spring. Lots of less than 500 pounds are quoted at 6½ cents per pound, and smaller quantities at 6¾ cents.

Linseed Oil.—Weather conditions during the week have interfered with the shipping, and consumption of Oil to a considerable extent. The demand at this point has been limited. The local market is firm, City Raw in small lots being quoted at about 64 cents per gallon, and out of town Raw at 63 cents.



Spirits Turpentine.—The local market has ruled quieter during the week, buying being confined to immediate requirements. Prices are firm at 45½ to 46 cents per gallon for Turpentine in retail lots.

The Electric Tower of the Pan-American Exposition has been sold to parties in Denver, Col., and it is to be taken down and shipped to that city, where it is to be reerected in a park. When rebuilt the outer covering will be of more substantial material than the present staff, and it is intimated that it will be fully illuminated when installed in Denver. Thus the great and notable attraction of the defunct Pan-American is destined to form a wonderful attraction in the far West. Its hight has been given all the way from 375 to 408 feet. It was designed by John Galen Howard of New York. It is expected that it will take about 30 days to raze it.

The Northern Electric Motor.

In the accompanying illustration we show the Northern electric motor made by the Northern Electrical Mfg. Company of Madison, Wis., connected to drive a foundry rattler. These motors are cast from a fine grade of soft steel, having a very high magnetic permeability, without a joint of any kind, thereby insuring a perfect magnetic circuit. The field coils are accurately formed of insulated copper wire wound evenly and compactly by automatic machinery. Insulation of the coils as well as protection from mechanical injury has been so well guarded that they are claimed to be practically impervious to water or oil.

The armatures are of the usual iron clad type, the core being built up of thin annealed soft steel disks, correctly punched and notched for the reception of the bars or coils. Each disk is insulated on both sides, and assembled on a spider, which is designed to facilitate a free and abundant circulation of air. The core is put under great pressure, bringing the disks into a solid, compact mass, yet perfectly laminated.

Northern Electric Motor Driving Rattler.

Particular attention is paid to the insulation between the segments of the commutators. Nothing but the best mica is depended upon for this important work. The segments are forged from pure copper, uniform in density and having the grain or flow in the direction of length, so as to secure a smooth, durable surface.

The coils are form-wound of wire or bar copper, according to the size of the machine. Each coil is made from a single length of copper and is inclosed in an insulating cell. The slots of the armature core are lined with a layer of insulating material before the bars are laid in place so that there is no chance of a "ground" or fault developing at this point.

The bearings are either of bronze or babbitt metal, according to the size of the machine. The arrangement is such that in no event is it possible for the armature to drop against the pole pieces and become damaged. Each bearing is spherically seated, making it self adjusting and self aligning.

Interposed between the motor shown and the rattler is a train of gears for reducing the speed. The dust proof qualities of this motor peculiarly adapt it for use in running the machinery in a foundry casting cleaning room, while it is suitable for a variety of uses where power is required.

Foundry Costs.

One of the last bulletins issued by the American Foundrymen's Association contains an article on foundry costs, from which we reprint the following:

Those of our foundrymen who are accustomed to careful records in their works, in order to detect any possible leaks or insufficient economy, will be interested in the following table showing the cost of 100 pounds of castings made during the fiscal year ending June, 1901. For obvious reasons no names are given. The original, printed in the bulletin, gives the figures for every month of 1901. We print below the averages for a series of years:

	Foundry Costs.			
Cost of materials:	1901.	1900.	1899.	1898.
Metals	0.7694	0.8479	0.4942	0.4589
Melting	0.0436	0.0453	0.0380	0.0368
Molding	0.0080	0.0072	0.0063	0.0062
Cores	0.0161	0.0138	0.0123	0.0138
Salaries	0.4729	0.4550	0.4172	0.4346
Misc. expense	0.0583	0.0514	0.0417	0.0482
Cost per 100 lb. castings	1.3683	1.4206	1.0097	0.9985
Weight of good castings	17,802,844	21,965,408	23,562,841	20,117,909
Defective castings, per cent	2.8	2.2	2.1	2.5

For a series of years the cost was as follows:

Cost per 100 Pounds Castings.

Average.	Average.	Average.
1897.....1.0866	1892.....1.2892	1887.....1.6900
1896.....1.1469	1891.....1.3457	1886.....1.5600
1895.....1.1332	1890.....1.4611	1885.....1.5900
1894.....1.1442	1889.....1.4842	1884.....1.8200
1893.....1.2687	1888.....1.5320	1883.....1.8700

This foundry does general jobbing work and makes car wheels.

Electroplated Doors.

A method of producing a wooden door which is thoroughly inclosed in metal without visible seams, thus giving it the appearance of a solid door, has been developed by an inventor in Bridgeport, Conn. This is accomplished by a process of electroplating the wooden doors with copper, brass or other metals, thus especially adapting them for use as entrance doors to flats or other large and expensive buildings where massive and elaborate effects are sought. Such doors are considered a valuable adjunct in preventing the rapid progress of fire, and metal protected doors are frequently used in theaters.

There is no necessity of burning off the varnish in order to revarnish, as is necessary with the old methods of covering or protecting. The finished wooden doors are first filled with a wood filler as, for instance, a mixture of linseed oil and resinous gum, which is designed to waterproof and protect the wood thoroughly and prevent warping. The doors are placed in a tank filled with the heated filler, which is kept hot by steam. After the filler has thoroughly penetrated the wood they are lifted out and permitted to drain off, after which they are laid on a table for further applications. The door is then rubbed smooth and coated with a varnish, as shellac, and is then dried. This operation is continued until the desired surface is obtained. The edges of the door are trimmed with sheet metal strips corresponding to the width of the door, being attached to the four edges by means of nails, screws or cement. The material used for the strips is preferably copper, bronze or brass. The face of the strip on the edge of the door is covered with a metallic insulating varnish, after which the entire door is coated with a metal substance, such as thin metallic leaf, metallic brass powder or common varnishing wash, with plumbago. When the coatings applied have become dry the door is rinsed and is ready to receive the electric deposit. The door is supported in a vertical position in the plating bath. One wire goes to the anode, and the second wire is preferably attached to the metal strip on one edge of the door; the current is then turned on, and the electrolytic action takes place until the surface is covered to any desired thickness.

The advantage obtained by covering the edges of the door with a sheet metal strip is that its high conducting power makes a complete circuit around the door, and the width of the strip insures an even and unbroken surface between the two sides.

The sale of the buildings of the Pan-American Exposition has at last been completed, the Chicago House Wrecking Company having purchased them for $80,000. Possession of the property has been given to the buyers, and the work of tearing down the buildings is to commence at once. The figure of the Goddess of Light, that occupied the apex of the electric tower, has been sold to David Humphrey, a popcorn vender of Cleveland, Ohio, and is to be removed to that city, where it is destined to occupy a position on top of a popcorn pavilion at Euclid Beach Park. How have the mighty fallen! Charles T. Harris of the Chicago Wrecking Company is quoted as expressing a belief that all of the steel beams and the iron work has been sold. Several parties have been after it. Some of it may go to St. Louis, while other parts will be used in small halls.

COST	SELL

Analysis No. 72,339. NEW YORK, Dec. 7, 1896.
We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.
The enamel coating is homogeneous, of extra thickness, and great purity.
It is *entirely free from arsenic, lead* and *antimony*—metals so often found in enameled goods.
Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

Analysis No. 14,180. NEW YORK, May 5, 1897.
LALANCE & GROSJEAN MFG. CO.:
GENTLEMEN—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.
We find this enamel is *absolutely pure and free from Arsenic, Antimony, Lead and other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,

Eave Trough,
Conductor Pipe,
Stove Pipe,
Elbows,
Wire Hangers.

Guaranteed to be the most practical stove pipe on the market. Requires no tools to put it together and can be reshipped to your customer in original package, taking 4th class rate of freight (Northern Classification.) 25 Joints shipped in wooden crate.

—MADE BY—

THE REEVES MANUFACTURING CO., - - Canal Dover, Ohio.

POLYGON

CONDUCTOR PIPE.

In presenting our Patent Polygon Sheetmetal Conductor Pipe, we feel confident that its merits are shown sufficiently in the cut to not require a long description.

The pipe is expansive Through its peculiar polygon scalloped spiral construction, producing sufficient expansion and resistance, an artistic effect is also secured, not possessed by any other conductor pipe in the market.

Ice forming in it will not, by slipping, as in other conductors, burst joints and seams, but will descend gradually, without injury to the pipe. Water, in heavy rains, will discharge more freely, as the pipe will not choke.

Considering quality of material used and workmanship required in producing the pipe, also the durability and design obtained, the Patent Polygon is, besides being the best, the cheapest in the market.

Made in copper and galvanized iron. Write for catalogue and information free. Address

Where did you get that Tile?

Is asked of the builder wherever our

METAL SPANISH TILE

is used. It is so pretty that everyone admires it, and as you are very likely to be asked about it, Mr Roofer, let us say to you

It can be made of any sheet metal;
It costs very little;
It can be laid very quickly and easily;
It requires no Solder, just a nail and a hammer;
It cannot leak, makes a light roof, is fireproof, never loosens, and lots more we can tell you if you will drop us a line.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.

THE WHEELS of PROGRESS.

The wheels of progress are rapidly moving and we are moving with them.

We already have the most complete and most artistic assortment of ceiling designs upon the market. Nevertheless we are constantly adding new patterns to our list.

You know the advantage of handling a line that is kept up-to-date.

That advantage applies as forcibly to metal ceilings as to any other class of goods.

For that reason, if for no other, you should lose no time in applying for an agency.

For the agency for Berger's Classik Metal Ceilings is an agency it will pay you to get.

"BERGER'S Classik METAL CEILINGS"

are HIGH ART Ceilings. They meet the requirements of high grade trade.

You can't afford to neglect the opportunity of handling this winning line. Write to-day for handsome catalogue and full particulars.

THE BERGER MFG. CO., - Canton, O.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

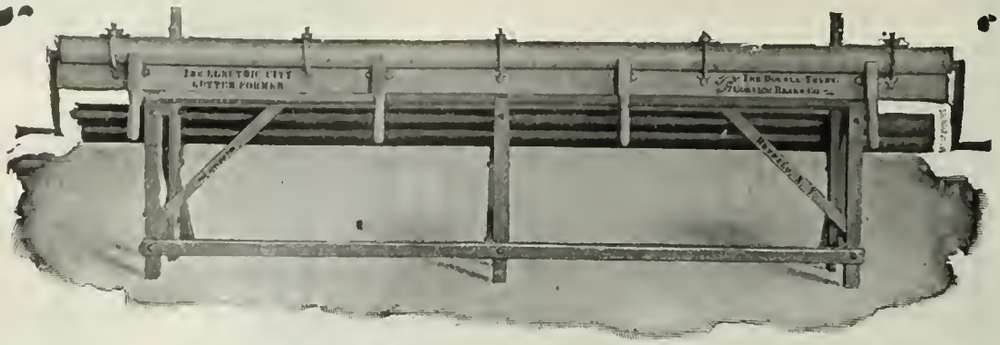
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

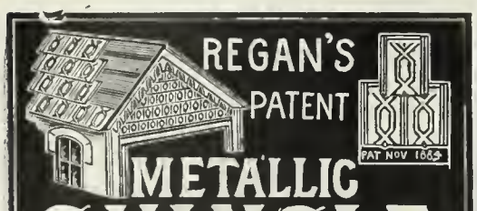
New in Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can he bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.



The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

AMERICAN STEAM and ALTITUDE GAUGES, POP SAFETY VALVES.

Heating Specialties. American Steam Gauge & Valve Mfg. Co., Bismark St., Boston, Mass., U. S. A.

We like to sell single ranges and furnaces, but we like better yet to sell them in bunches of six, a dozen or a hundred. Not long ago, we sent six of our Excelsior Double Oven Ranges to Mr. J. W. Morrison of Holmesburg, Penna., and this is what he did with them:

"I placed six of the 806 Excelsior Portable Double Oven Ranges in the buildings known as the Annex to the Morelton Inn, at Torresdale, Penna. Every one of these ranges has given entire satisfaction."

That double oven Excelsior Range, by the way, seems to occupy a field of its own. It is uniquely good.

ROUND OAK
STANDARD OF AMERICA

The Beckwith Hot Blast
will be a new member of the Round Oak Family for 1902.
We mean that this stove shall be the best "hot blast" on the market.
It will have the famous Round Oak one piece bottom and draft register, which never gets out of order—and is positively air-tight.
Movable hot blast draft tube in top with new device for raising or lowering that draft may always be delivered on top of fire.
The incomparable anticlinker Round Oak coal fixture will be used.
It will be mounted with Woods 14 gauge Double refined, cleaned and cold rolled iron, highest quality made.
Nickel work plain, massive and rich.
If you are looking for a "hot blast" to compete write us for further details. "Price right."

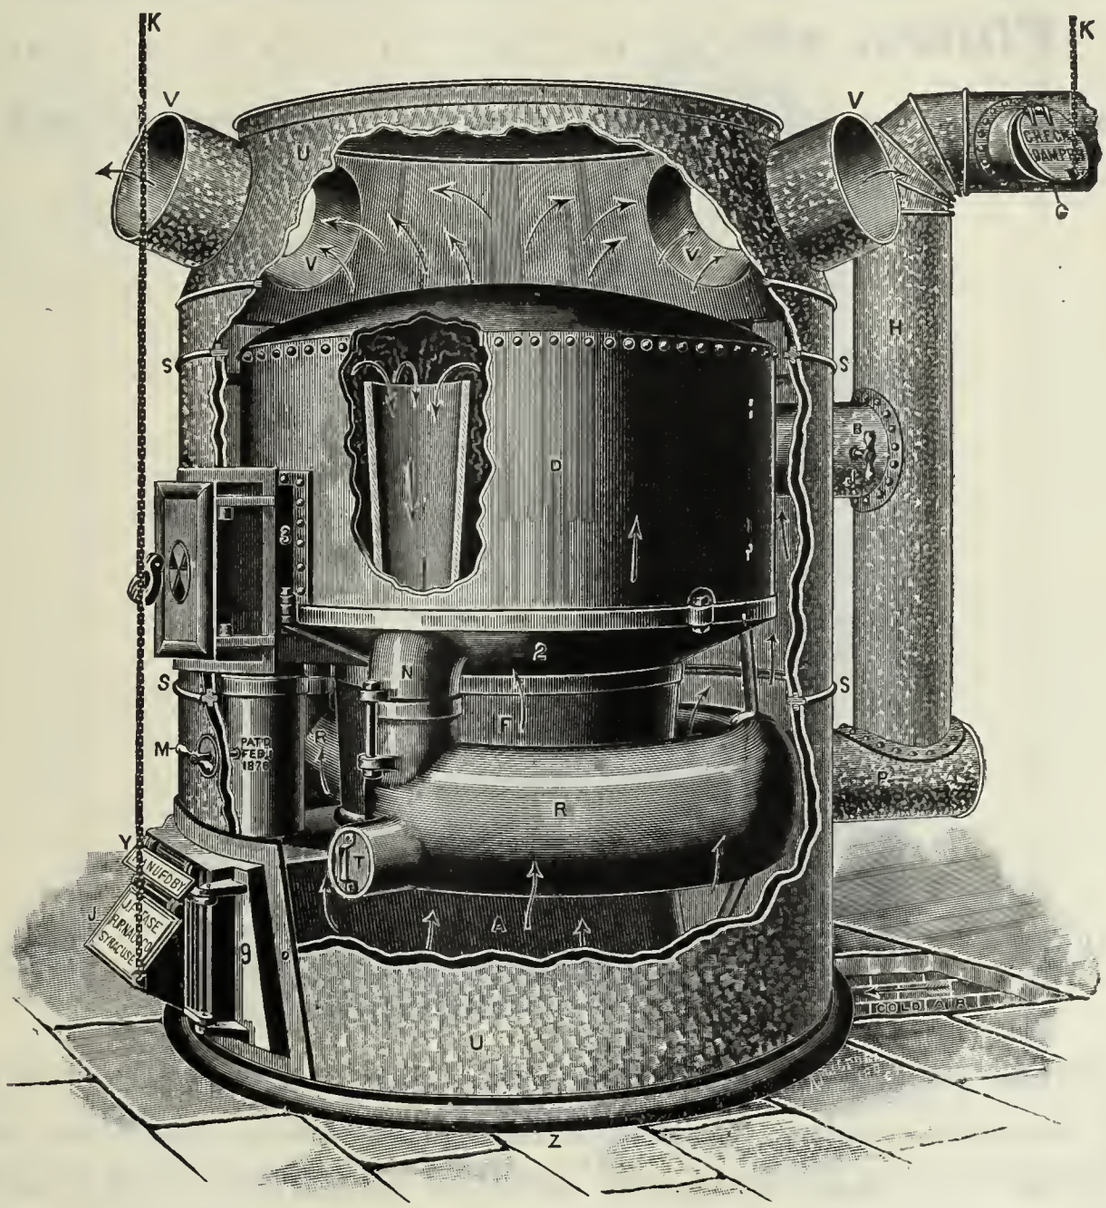
Makers of Good Goods Only



HB CHICAGO

Like a house builded upon the sand, so is a trade founded upon the sale of "Paste-Board" Heaters.

The dealer who sells "Economy" Furnaces builds upon the rock.

The PEASE-ECONOMY
WARM AIR FURNACE

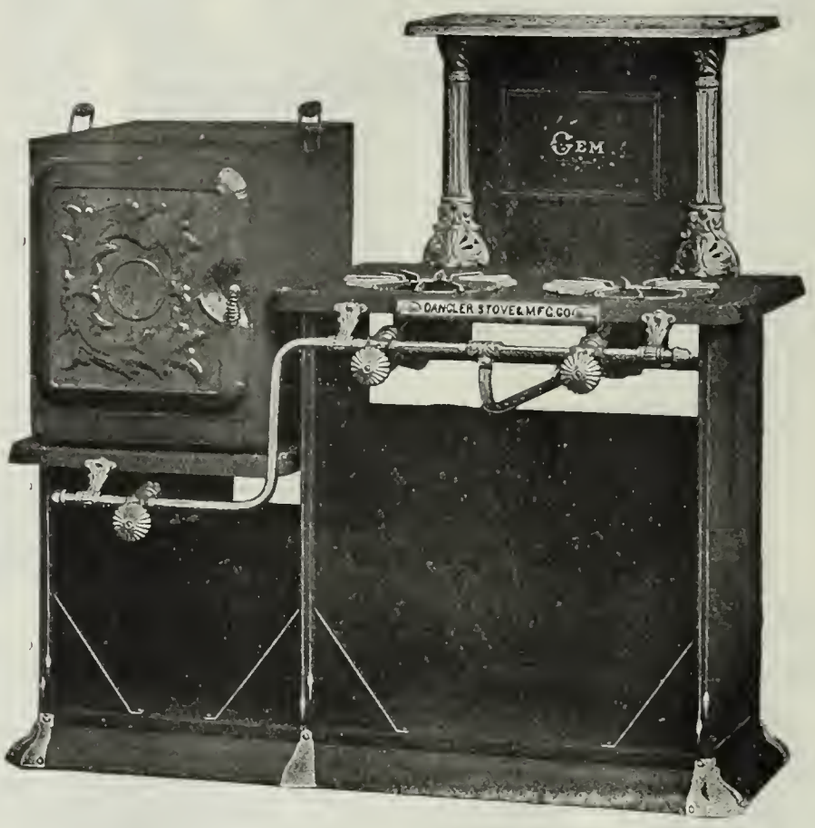
Has proven the corner-stone of more than one steady lucrative business.

LOW DOWN PATTERN.

This is a Heavy, Durable Heater of the Highest Efficiency, but of Moderate Price. : : : :

INTERNATIONAL HEATER CO.,
UTICA, N. Y.

BOSTON, NEW YORK, CHICAGO, DENVER.



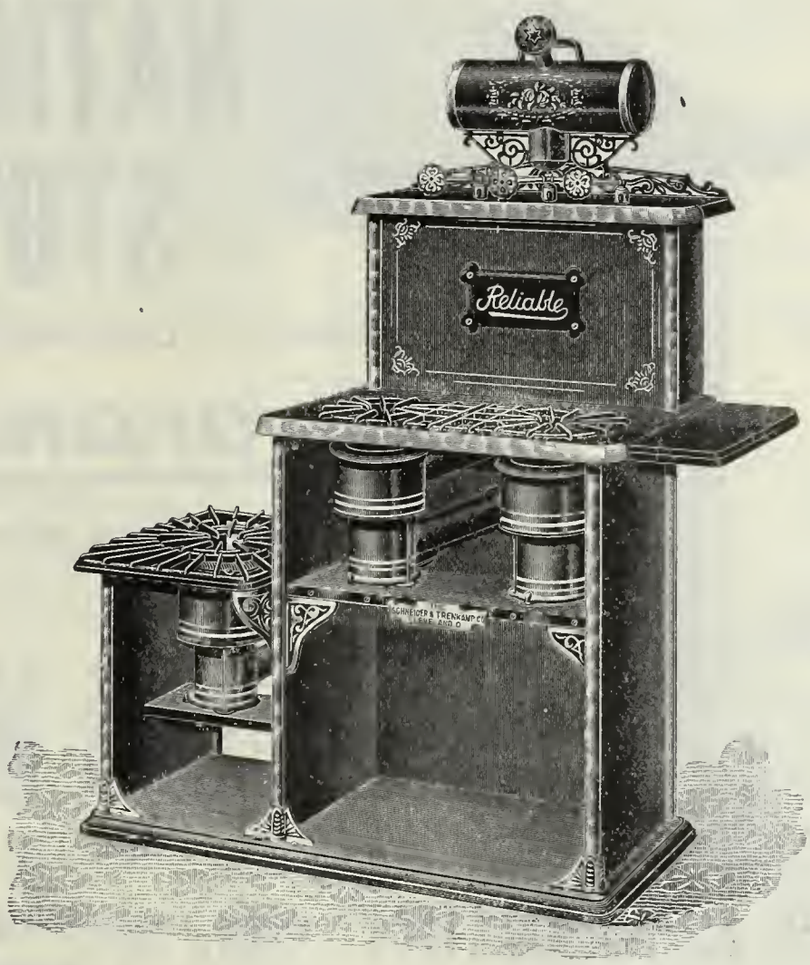
LARGEST MAKERS OF HEATERS IN THE WORLD.

THE DANGLER

For 1902 will put on the market a line of

Gasoline Vapor and Evaporating Stoves, Blue Flame Wick and Wickless Oil Stoves and also a line of Gas Ranges, Stoves, Hot Plates, etc. . . . . .

That for design, style and mechanical construction will not be equalled by any other make.



Our experience of 21 years in the manufacture of this line of goods,—being the oldest manufacturers,—justifies us in making the claim that our product has merits not found in other makes of Stoves in this line, notwithstanding that our lists, discounts and terms are the same as other manufacturers'.

All orders intrusted to us will have our careful and prompt attention. For further information we invite correspondence.

The Dangler Stove & Mfg. Co.,
Cleveland, Ohio, U. S. A.

Reliable Vapor Stoves and Ranges for 1902.

DEALERS who are seeking a strictly high grade line of Vapor Stoves and Ranges that are standard the country over cannot afford to overlook our line. "RELIABLE" Stoves have the NAME and FAME as being the best and most successful to handle.

THERE are NONE better. A few are claimed as good. None as well and favorably known. Our reputation will not permit of our making any inferior goods. If you wish to control the Vapor Stove business of your city, secure the agency of the "RELIABLE." They have proved profitable and satisfactory to thousands in the past, and will to you

Our line for 1902 is larger and finer than ever. Send for our latest catalogue. It is yours for the asking.

REGARDING

Boomer Furnaces.

OR

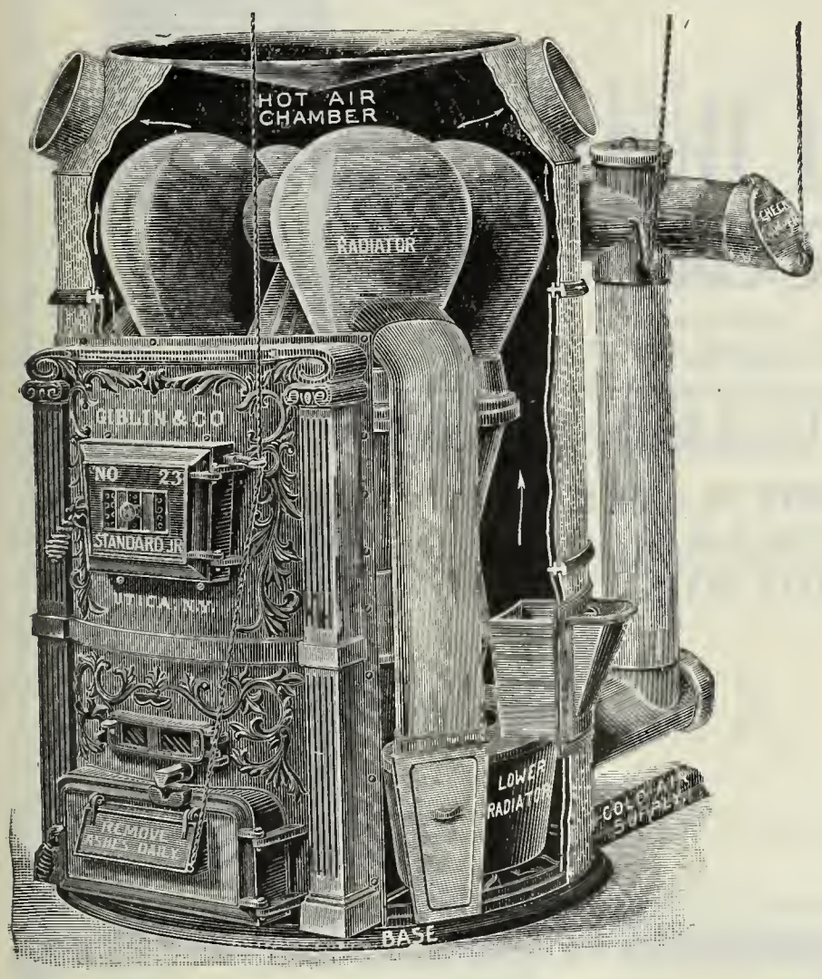
Boomer Steel Ranges

Boomer Furnace.

We want to state in strongest terms possible that if you want the

HEAVIEST,
MOST DURABLE,
MOST ECONOMICAL

and easiest to take care of Furnace or Steel Range, buy a **BOOMER.**



Boomer Steel Range.

Neither time nor money is spared to make them the Best.
Buy Boomers and save your coal bills.
We invite investigation.

THE HESS-SNYDER CO.,

Manufacturers, MASSILLON, O.

TOUCH A MAN'S POCKET

and you touch a sensitive spot. If your customer asks for a furnace and you furnish him with the cheapest furnace obtainable, it surely is not the best and he will judge all other furnaces by what he gets. He will, by using the cheapest furnace, burn more coal than he should; will burn it imperfectly.

IT WILL

cause more work, need frequent repairs, make him thoroughly dissatisfied. Such are the results of a direct draft furnace. We present the furnaces illustrated herewith to

SHOW

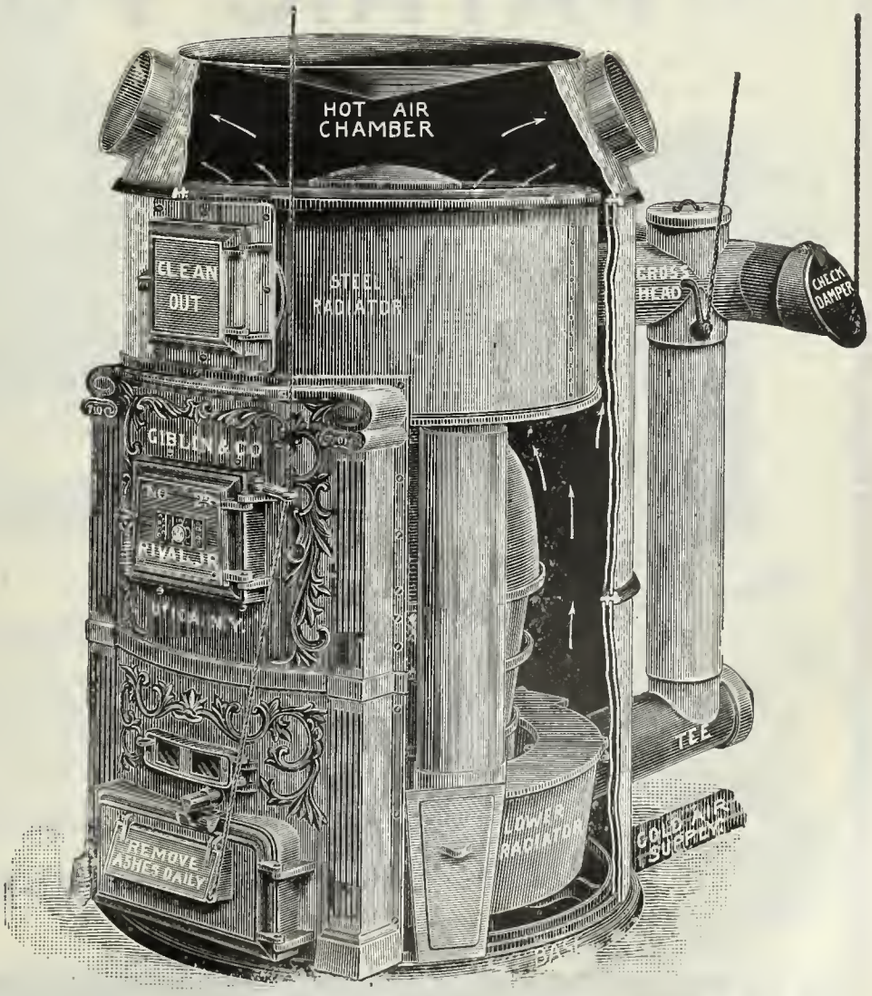
what indirect draft furnaces can accomplish. Nobody now uses a direct draft heating stove, because of the waste of fuel and the impossibility of regulating it.

These Furnaces

are in furnaces what base burners are in stoves and

Secure

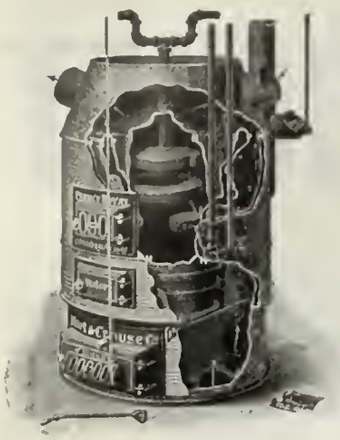
for the user the benefit



of **Heat** without

wasting fuel. They are operated with a steady, low fire, providing an even, continuous temperature

In Every Room.



Whichever dealer secures the agency of these furnaces is sure to get the bulk of the business; and because he is selling something different from all other dealers will make sales at a good profit and make every one sold an advertisement for his business.

Dealers who have sold other furnaces and have found no profit in the business should investigate the merits of these furnaces and secure the agency and exclusive territory.

See Our Advertisement Next Week.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

THE PECK-WILLIAMSON COMPANY,

CINCINNATI, OHIO.

"I used from eight to nine tons of coal, (usually nine) in my old ———Furnace. I have never used quite eight tons in any season since your "DIGHTON" was installed in '98 and I get much better results than I ever had with the old one."

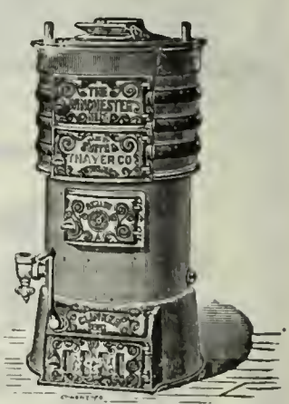
A sample of many letters from "DIGHTON" customers who think the "DIGHTON" the most economical Furnace ever built.

DIGHTON FURNACE CO., Taunton, Mass.

FIFTY-TWO YEARS

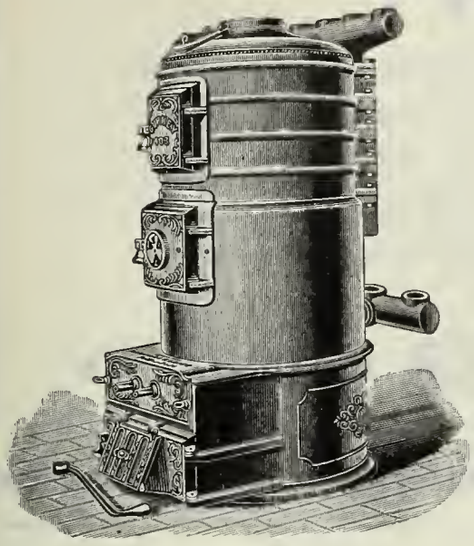
LONG while, isn't it? A man ought to learn something in that time, hadn't he? Well, we don't know it all but we do know how to make Furnaces. Our apparatus, owing to its tubular construction, carries away the heat as fast as made, not allowing the air to become burnt or overheated. From a sanitary point of view it has no rival. We embody in our goods only the best materials and workmanship. Say! Mr. Dealer, there's a good profit in it, too.

WRITE FOR CATALOGUE.



The Thatcher Furnace Co., WARM AIR FURNACES, RANGES, STEAM AND HOT WATER HEATERS. 240 Water St., New York.

WINCHESTER



Price and quality are two good salesmen. Price gets his trade from the thoughtless, hasty, hurried man, who can't or won't look beyond the surface. Quality appeals to a man's intellect, his judgment, his mature thought. To such we offer the "WINCHESTER" heater, content to let its sale rest on its merit. Smith & Thayer Company, Boston, Mass. 106 Beekman St., New York.

Manufactured by THE

Anderson Coupling Co.

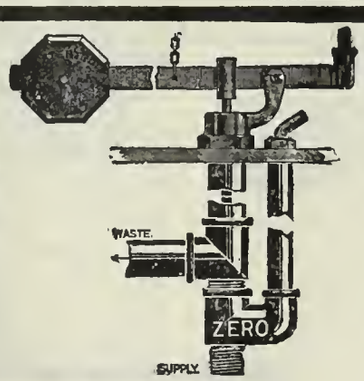
PORTLAND, CONN.

The Climax

RATCHET STOCK

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe takes 2 or 2½ in. die, $10.00.



No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. dio, $17.00

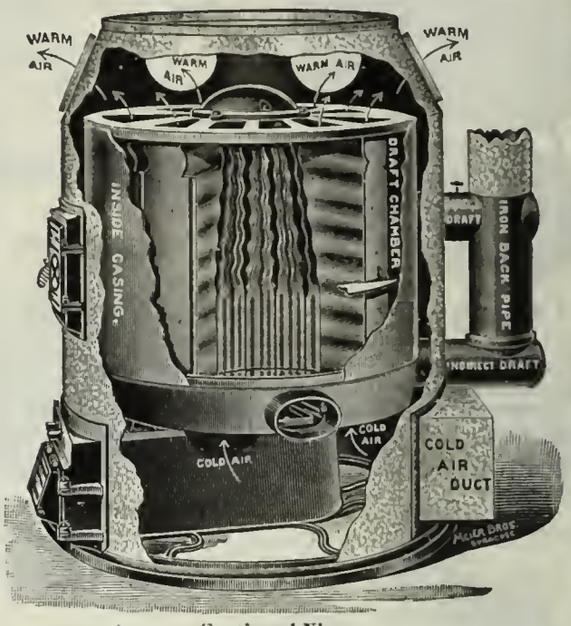
59 Park Place, N. Y.



The Kelsey Warm Air Generator.

THE PRINCIPLE

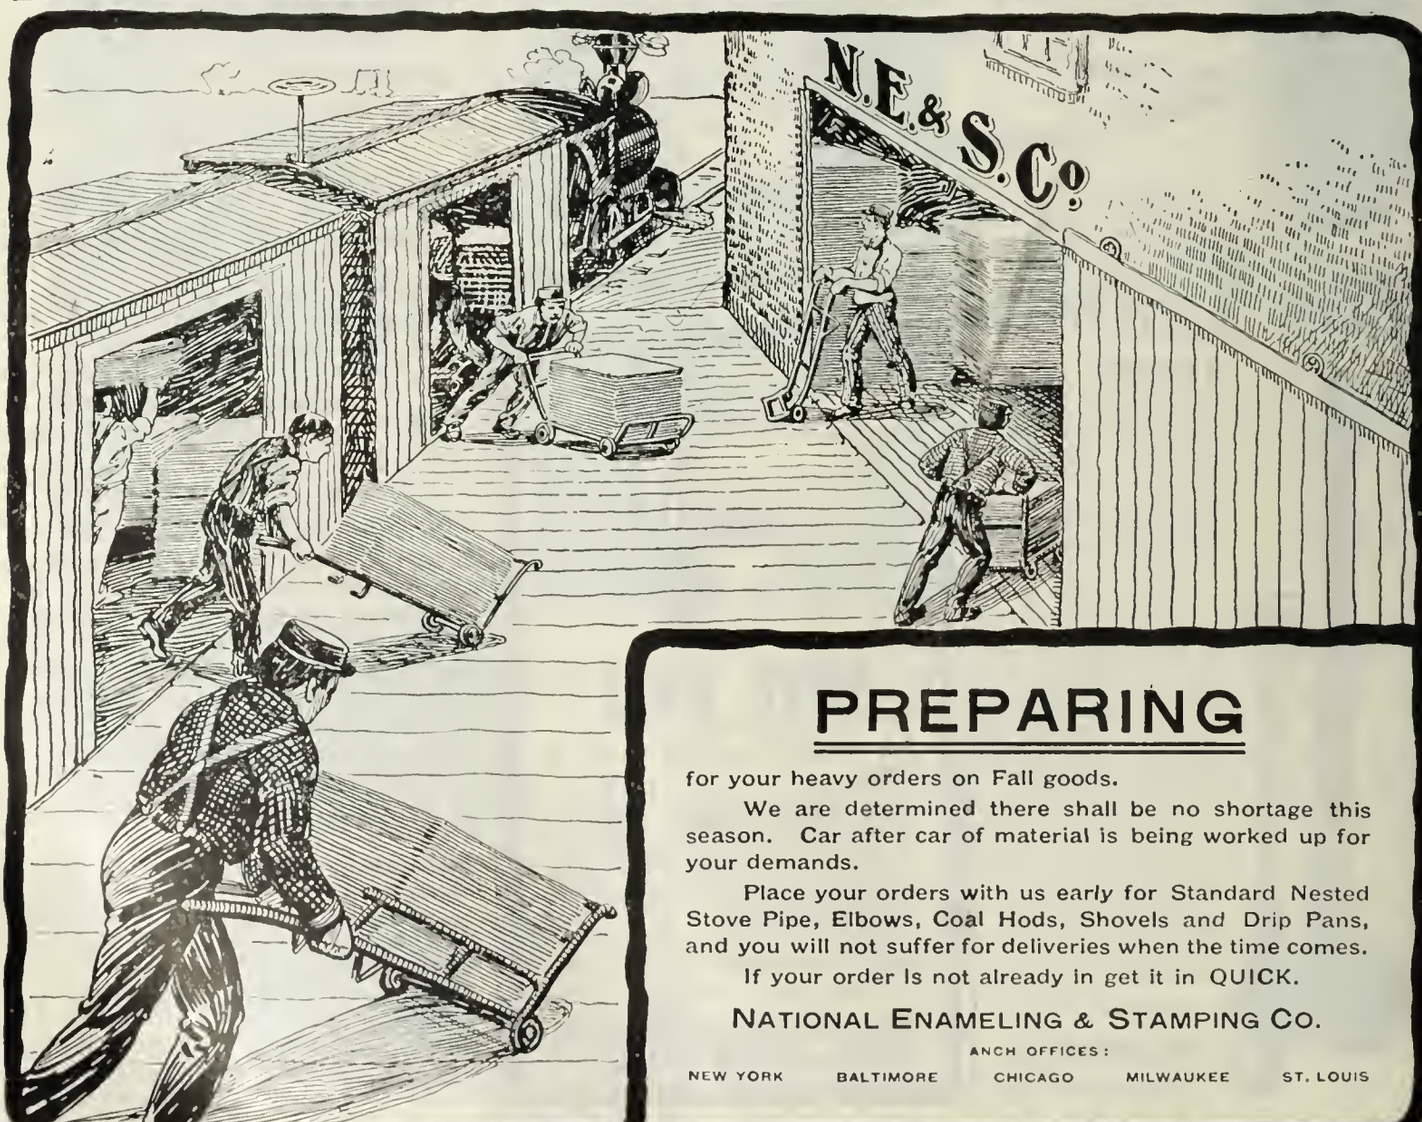
Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.



Ask for booklets **"KELSEY HEATING"** and **"OPINIONS."**

Decrease In Iron Production.

The many troubles which beset the blast furnace managers during the past month, in the shape of floods, coke shortage and lack of transportation facilities, conspired to considerably cut down the output of iron and also delayed the starting of additional stacks, which would otherwise have been added to the active list during February. Consequently, the monthly blast furnace statistics published in *The Iron Age* show a falling off in the furnace capacity from 340,612 tons on February 1 to 330,710 tons on March 1. This reduction is mainly due to the fact that in February the records of the active plants, upon which the capacity of active furnaces is based, were considerably below the normal. The actual production in February, a short month, was 1,250,000 tons, whereas the normal make ought to have been at least 75,000 tons larger. It is not surprising, therefore, to find that furnace stocks of iron fell off from 150,200 tons on February 1 to 125,348 tons on March 1, a decline of nearly 30,000 tons. In fact, had transportation facilities been adequate there undoubtedly would have been a further depletion of the slender supply of pig iron held by the merchant furnaces. Although the coke and transportation difficulties are lessening somewhat, it would be expecting too much to look for a full return of the maximum productive capacity during the current month. That, of course, means continued scarcity of iron. After this month, however, we may expect record breaking totals of pig iron production month after month, which ought to ease the situation. A number of new open hearth furnace plants, now under construction, will also be falling into line during the next few months. Meanwhile some fancy prices are being paid for spot foundry iron, and the outlook is for a continuance of high figures.

Peace in the New York Building Trades.

After a fight lasting for six years the warring factions in the building trades unions of New York City and vicinity have buried the hatchet and joined forces, with the object of doing away with the interneeine disputes which have been the cause of so many building strikes during the past few years. Six years ago the Building Trades Council was formed by unions which seceded from the Board of Walking Delegates, and since that time there has been a constant series of strikes and disputes in the building trades, owing to the rivalry between the two bodies of workmen. Twice in the interval they have come together and reached an agreement to amalgamate, but in each case the agreement fell through and failed of consummation. This time, however, it seems that an actual agreement has taken place and the breach is understood to have been finally healed. The settlement was come to at a meeting of the two bodies on Tuesday of this week, when an amalgamated association, to be known as the United Board of Building Trades of New York, was formed, with a full list of officers. Furthermore, a committee has been appointed to provide a constitution and by-laws, a leading feature of which will be a clause providing for the arbitration of all labor disputes. Thus, it is hoped, a period has at length been put to the troublesome and unnecessary interruptions to building operations, through the disputes of the rival unions, which have been afflicting New York City for so long. Already the settlement has resulted in the calling off of a strike involving some 1500 workmen employed on a number of large buildings that are being erected by one of the big contracting concerns. The settlement of this war of unions will be hailed with satisfaction by a long suffering public as holding out the prospect of a new era of improved conditions and the removal of a seriously disturbing factor from the local building industry.

The Tin Plate Situation.

The wage scale agreement between the American Tin Plate Company and the Amalgamated Association, referred to in our last issue, whereby the danger of any prolonged closing down of the tin plate mills this summer by strikes, or pending the conclusion of wage negotiations, is removed, is a matter for congratulation, it being taken for granted that the agreement will be ratified by the lodges of the Amalgamated Association. Can and tinware makers and other consumers of tin plates now feel that they can safely book orders for finished goods for delivery throughout the year without risk of failure to fill contracts through inability to secure material, as happened last year. The conservative attitude of the principal producers of tin plates, too, justifies the confidence that prices will not undergo any radical change for some time to come, unless the unexpected happens and iron prices soar beyond reason, a contingency which seems unlikely to occur. Certainly it is reasonable to conclude that tin plate prices will not recede below their present level for an indefinite time, judging by the remarkable strength of the raw material. All the indications favor a steady market on tin plates through the year, with a demand that will absorb the output of the mills, even if they are kept at their full capacity for the entire twelve months. At present most of the mills are from one to two months behind in their deliveries on contracts, and it will take them some time to get abreast of their current business. It is likely that 1902 will prove a banner year in both the production and the consumption of tin plates in this country.

Retail Hardware Associations

The reports of the annual meetings of State retail hardware associations which have appeared in our columns in the past few weeks give ample demonstration of the vitality of the movement among the retail hard-

ware and stove trade in the direction of organization. It will be evident to those who peruse these reports that many thoroughly representative merchants are among the active friends of the movement, which they are helping along by their identification with it and their co-operation in its work. That representative merchants of character and position are willing thus to give to the trade at large the benefit of their time and thought gives the association movement an important indorsement, which will commend it to those in the trade who are not already identified with it and thus help materially to insure its success. Many of the papers read before the associations relate to questions of so much interest and were discussed in so broad and intelligent a way as to deserve the general attention of the trade. The increase in membership of nearly all the associations during the past year is exceedingly encouraging as giving promise of still further growth. Most of them report substantial progress, and in some this has been very marked. There is evidently an opportunity for a friendly rivalry, not only as to which State is to have the banner association in the matter of membership, but also in the efficiency of its work and the success with which it accomplishes the objects for which it is organized. This is a matter in which very much will depend on the lines on which the association works and the efficiency of its executive officers. It must not be overlooked that new associations are being formed in States which heretofore have not joined the movement, and that in certain States the subject is under advisement, although nothing definite has been accomplished. Many merchants recognize the existence of evils which the association movement endeavors to correct, but while its aims have their hearty approval they are waiting for others to do the pioneer work and prepare the way for the association. The association spirit, while already showing itself an important factor in the trade through the organizations which are now in operation, has an undertone of sympathy and strength among the merchants at large which is only waiting an opportunity to make itself felt.

A National Corporation Act.

A proposal which demands very thoughtful consideration has been brought forward by James B. Dill, who has been conspicuous as a clear headed and discriminating advocate of what is best in the movement toward the consolidation of industrial enterprises. Mr. Dill developed his ideas in an address before the Economic Society of Harvard University, crystallizing his plans for a Federal law in the following, as a basis for future discussion:

"1. It should be optional, as in the case of the National Banking act, leaving corporations free to organize under State acts if they choose.

"2. It should deny the name 'national' to any but national corporations, compelling other corporations who assume that title to change it.

"3. National corporations should have freedom from State supervision and should be subject to taxation by the State only to the amount of property actually in the State, and then upon the same basis as an individual.

"4. A national corporation should possess in every State all the immunities and commercial privileges guaranteed to natural persons by the Constitution of the United States and of the several States.

"5. It should be protected from State attack to the same extent that the national banks are—viz., it should not be subject to attachment or other provisional limitations which prevail in any State against nonresidents—that is to say, being a United States corporation, it should be a citizen of the United States and a citizen of each State, to the extent that it has all rights of citizens as to attacks in the courts.

"6. The national corporation should be subject to national supervision and examination, and should require at least private publicity, which would ultimately result in public publicity.

"7. An annual report should be made by the corporation, showing the taxing situs of all its property. Such information should be collated by some Federal authority and furnished to the taxing officers of the various States, in order that the corporation might be justly and correctly taxed.

"8. A national corporation should pay local taxes upon all its property. Its stock in the hands of stockholders should be exempt from taxation of every nature."

While there are many earnest men who insist that trusts, so called, should be legislated out of existence, we believe that a vast majority recognize that they represent a movement certain to be productive of good to producer and consumer, investor and workman alike. While that is recognized quite generally there is a feeling of fear of the enormous power of these consolidations, when swayed by men either reckless or unscrupulous. There has, therefore, been a growing conviction with the public that some method of control should be devised. Thus far nothing has been brought forward which is not radical and, therefore, unwise. Mr. Dill's proposal for a national incorporation law is moderate and fair. The movement toward consolidation of interests has reached proportions which make it impracticable to deal with it through State laws. The sooner this obvious fact is admitted and legislation is shaped accordingly the better for all concerned.

The export figures of the United States for the month of January and the seven months ending with January, 1902, just published by the Treasury Bureau of Statistics, show an improvement in the outward movement of manufactures. The value of manufactures exported in the month of January, 1902, amounted to $34,412,992, against $32,654,035 in January, 1901. They are the largest shown in any January except 1900, when the total was about $1,000,000 greater. For the seven months ending with January the exports of manufactures were about $73,000,000 less than for the corresponding period of the fiscal year 1901. The January figures, however, hold a promise of an enlarged movement during the present year. Manufactures in that month showed a greater evidence of activity than any other class of exports. This is the only important class of exports which showed an increase in January, 1902, over January, 1901, the agricultural products and the products of the mines, forests and fisheries exported being smaller in amount and value than those of the corresponding month of last year. In the three leading classes of manufactured articles exports of which showed a decline during the past year—illuminating oil, manufactures of copper and manufactures of iron and steel—a decided improvement is noted.

In the statistical abstract lately issued by the Treasury Bureau of Statistics covering the century from 1800 to 1900, some very interesting comparisons are made illustrating the changes in the relative rank of the different States of the Union in the course of the century. At its opening Virginia ranked first in population; in 1900 it ranked seventeenth. Pennsylvania is the only State that held its position throughout the century, having ranked as second in population in 1800 and the same in 1900. New York, which stood first in 1900, was third in 1800. North Carolina, which stood fourth in rank in 1800, was fifteenth in 1900, while Kentucky moved down from eighth in rank in 1800 to twenty-ninth in 1900 and Delaware from seventeenth to forty-sixth. Indiana moved up from twenty-first in rank in 1800 to eighth in 1900, and Ohio from eighteenth in 1800 to fourth in rank in 1900.

THE WESTERN STOVE TRADE.

The influences now prevailing in the stove trade are all tending toward activity and higher prices. The advance in the cost of production caused by the higher prices of pig iron and other materials has fully justified the advance made in the price of stoves and ranges at the beginning of the year. Taking pig iron alone the advance since the month of December has been about 20 per cent., and from present appearances the highest point has not yet been reached. During the past week pig iron developed greater scarcity in Western markets than at any time for many years. The situation in the iron market is really much stronger than during the boom of 1899, when prices were very much higher than they have yet reached this year. The consumption of iron is on a much greater scale. The production has increased fully 25 per cent. over the amount produced during the time of that boom, and yet, notwithstanding this great increase in production, the country is consuming the output easily and demanding still more iron. If the iron trade had not been largely under the control of great consolidations, whose policy has been to keep prices down, the price of iron would ere this have been as high as, if not higher than, anything known in 1899. It would seem, however, that a point has been reached at which the control of the market is passing out of their hands. The Chicago market has seen such prices paid within the past few days as would seem to indicate that a higher level is inevitable.

That dealers generally through the West have recognized these conditions is demonstrated by the freedom with which they have recently been placing orders for all kinds of cooking and heating apparatus for summer and fall delivery. Almost without exception, the Chicago stove houses report an active demand from their customers, so large as to surpass anything of the kind known for a number of years. The stove manufacturers are themselves so convinced that prices are likely to be higher that in notable cases salesmen have been instructed not to accept any orders for delivery after the middle of July. That date is fixed because it is believed that by that time a higher price, and perhaps a considerably higher price, will be made on all sorts of stoves.

The stove manufacturers who held their prices open for a few days before putting the advance in effect at the first of the year are now seen to have made a business blunder. They might as well have reaped the full benefit of the advance from the time that it was first known to be decided upon. The volume of business thus booked was possibly desirable, but it would have been better for their profit and loss account if they had not been so eager to make sales. It looks now as though the manufacturers who limit the time during which they will make deliveries at present prices are acting prudently.

In addition to the advance in cost due to dearer raw material, the possibility exists that the cost of manufacture will be further increased by an advance in wages, The annual conference between the representatives of the stove manufacturers and a committee of the Molders' Union will be held in Chicago on the 27th inst., at which a demand will be made for an advance of 10 per cent. in the wages schedule. It is possible that the outcome of the conference may be the maintenance of the present wages schedule; but this is uncertain. Should it result in an agreement to make the advance asked for, that, in itself, will increase the cost of stoves at least 5 per cent. If such a change is made, it will be absolutely necessary to make an immediate advance in the price of stoves and ranges to cover this increased cost, as the new wages would go in effect on April 1.

In a report to his Government the French Consul at Tiflis, Asiatic Russia, says that a large trade has been developed in that region in Oil Stoves for heating and other domestic uses. Some of those used are of American origin, but the majority come from Berlin. They are used chiefly for heating rooms, cooking and ironing, &c. These Stoves fetch high prices, as the import duty on such goods is high. The Consul adds that all Stoves imported into his district must be accompanied by a certificate of origin.

Furnace Work Records.

Approves of Furnace Work Record.

BY C. E. OLDACRE.

I think that the table presented under the head "Furnace Work Records" should prove very valuable to the trade as a whole, and am glad that it has been given before the heating season has entirely passed. I am satisfied that it will bear fruit, and be highly valuable to every one who makes use of it to record several jobs that have been installed during the season. If such records were then returned to *The Metal Worker* for presentation it would afford all furnacemen an opportunity of looking over the relative proportions of different men's practice and provide them with valuable data. If such a comparison should lead to the correction of errors that have been made in the past, it would also afford a means of correcting them in future.

In my opinion, however, the table hardly goes far enough, or it may be better, perhaps, to supplement it with another rather than to continue it further. I would suggest that it be extended so that it could also give the record of an efficiency test, giving the date of the test; the temperature outside; temperature of each room heated; temperature of air at register; average temperature of house; temperature of hot air at register; area of each flue in wall or partition; length of each cellar pipe; temperature of air in each pipe, not over 3 feet from heater, to show loss from friction and radiation; character of the building, whether stone, brick or frame, and if brick or stone, whether stripped on inside or not. Such tables would be of great value to men who lay out work, but, in my opinion, it would not be of such material benefit as a shop card.

Approves the Record and Comments on Proportions.

BY G. R.

Having studied the article on the "Furnace Work Record" and also the record itself, I think very favorably of the scheme, and am of the opinion that it is very complete as presented. Every point seems to be covered that would be necessary in a general record. If it was filled out, as intended, by some of the furnacemen who are now having trouble with their work, it would be but a short time before they would have no further cause for complaint. Some men may say they have not time, or that it is too much trouble to do the necessary figuring and calculating to fill out the chart properly. Experienced men have no need to do this for smaller and ordinary work, but there can be no question that even their experienced judgment would be benefited by a reference to such a well kept record for some of their larger or unusual work.

I could not help but notice that some of the proportions must digress a little from a direct consideration of the chart. What I wish to point out, however, is that the more heating surface a furnace has to a square foot of grate surface the more economical and satisfactory would be the results, and with a smaller quantity of fuel. If a furnace was proportioned with 1 square foot of grate surface to 30 square feet of heating surface it would heat 66,000 cubic feet of space instead of 37,000, and with from 10 to 15 per cent. less fuel. I will illustrate the problem this way: A grate 30 inches in diameter has an area of 4.9 square feet; therefore, if 30 square feet of heating surface is provided for every square foot of grate surface, it would expose 147 square feet. In ordinary work, every square foot of heating surface, where the exposure is not too great, will take care of 450 cubic feet of space. For work where the exposure is very great I would not recommend that 1 square foot of heating surface be depended on to heat more than 350 cubic feet of space. This would be taking the safe side, and I feel that there is no doubt that a furnace proportioned as I have said would do the work if it is properly located and connected.

Furnaces, as a rule, have their grate surface better proportioned for the amount of work to be done than

the heating surface is proportioned to the grate or work. This is due to the fact that it is easier for the manufacturers to give larger heating surface to small grate surface than it is to provide the requisite amount of heating surface when a large grate surface is used; consequently, the grate surface is expected to do the work that the radiating surface should do, and the result is that furnaces soon burn out. What is needed in furnaces is more radiating surface. Has there ever been any rule for determining a hot air job that will provide a temperature of 70 degrees in zero weather, no matter what the temperature outside may be when the test is made?

DEATH OF GEORGE H. HOLLAND.

George H. Holland, vice-president of the Bridge & Beach Mfg. Company of St. Louis, Mo., died of cancer of the throat, at St. Luke's Hospital in Chicago, on March 16, after an illness of six months, during which he was a great sufferer. Mr. Holland was born on May 2, 1847, in Dublin, Ireland. He went to St. Louis in 1853 with his parents, and in 1868 entered the employ of

GEORGE H. HOLLAND.

the Bridge & Beach Mfg. Company as a bill clerk. On the retirement of John H. Beach from the firm, in 1872, Mr. Holland was given an interest in the business, which was materially increased in 1875, at the death of H. E. Bridge, Sr. His advancement in the business was steady until he attained the position of vice-president. The company prospered greatly under his management, and it is largely due to his efforts that they are to-day not only one of the oldest, but one of the most solid and progressive concerns in the stove and range manufacturing business in the United States.

Mr. Holland was energetic and systematic in all of his transactions, and was ever ready to encourage those under him who showed a disposition to work. His Northern Irish disposition rendered him exceedingly conservative and cautious, and it was a fixed rule of his from early boyhood never to involve himself in debt for even the necessities of life. His policy was to pay as he went, and this policy justified itself to a marked degree in the success of his personal management of the company with which he was associated. He was retiring in his habits and never courted publicity. He declined several directorships in banks and other financial institutions, preferring to devote his entire time to the interests of the Bridge & Beach Mfg. Company.

Mr. Holland had planned to retire from active business life this year and devote five years or more to travel with his wife and daughters. Last August, accompanied by one of his daughters, he went abroad for the purpose of making an extended tour of Europe. When he reached London he was very ill, suffering from what seemed to be an abscess in his throat. On consulting a specialist it was pronounced to be a cancer. Dr. Butlin, the eminent English surgeon, performed an operation on August 29, and Mr. Holland remained in a private hospital in London until November 1, when he abandoned his traveling plans and returned to St. Louis. Shortly after his arrival there he experienced a recurrence of his malady and, upon the advice of his physician, went to Boston, where a second operation was performed on December 1. He remained in a hospital in that city until early in January, when he returned home. In the middle of the month, however, he went to Chicago and began a course of treatment at the St. Luke's Hospital, which was attended by gratifying results. He remained there in the hope of his permanent cure, but in the early part of last week a change for the worse developed in his condition, and he rapidly sank until his death on Thursday. Mr. Holland married, in 1879, Miss Nora Wilcoxson of Carrollton, Mo., who, with two daughters, survives him. He was a member of the St. Louis, Noonday, Country and Commercial clubs of St. Louis, but took no part in secret or fraternal organizations.

Death of R. McDougall Campau.

R. McDougall Campau of the Peninsular Stove Works, Detroit, Mich., died on March 2 at his home in that city, aged 45 years. For the past two years he has been an invalid, and had resided in a sanitarium, but recently he returned home in apparently improved health. Mr. Campau was born in Detroit 45 years ago, his father, Alexander M. Campau, being one of the wealthiest real estate holders of that city. R. McDougall Campau was one of the organizers of the Peninsular Stove Works, in which he occupied a responsible position until forced to retire from business on account of ill health. He was also connected with a number of other business enterprises in Detroit, and was prominently known in amateur athletic circles. He is survived by a widow and two daughters. The funeral took place on March 4 from the family residence, 189 Parker avenue.

Crane's Gas Cooking Appliances.

The William N. Crane Company, with main office at 1131 and 1133 Broadway, New York City, have issued the spring edition of their catalogue of gas appliances for cooking and manufacturing purposes. The publication, known as Catalogue No. 21, consists of 80 pages, profusely illustrated and bound in red paper covers. The work briefly sets forth the principal features of the company's gas appliances offered for 1902, the line comprising too many articles to permit of a presentation of full particulars concerning each and every one. Special attention, however, is called to the fact that the Vulcan and the Perfect ranges this year embody several new and valuable features; but, as the company say: "Changes for mere talking points have always been avoided, such alterations leading to complications in furnishing repairs." They state that they long ago recognized the supplying of parts as a very important thing. Their practical experience in New York, where they have supplied thousands of rental ranges, has given them the opportunity of meeting all requirements in this line, and in the construction of their ranges they have taken into consideration the easy renewal of all parts for repairs.

The concern are the sole agents for the Perfect ranges, made by the Gem City Stove Company of Dayton, Ohio. In addition to the ranges mentioned, attention is given to broilers, carving tables, plate warmers for hotels and private families, cake griddles, waffle stoves, oyster cookers and stewers, automatic coffee and tea urns, water urns, chafing dish stoves, the Vulcan Giant burner, tailor and laundry stoves, gas irons, ovens, hot plates, toasters, coffee roasters, gas stove fittings, &c. The company announce that they issue three catalogues, one in a red cover, relating to cooking appliances; one in a green cover, describing their heating appliances, and one in a blue cover, relating to Bray burners. Accompanying the catalogue is a special price-list and discount sheet, and also a price-list of gas fixture fittings.

STOVES.*

BY A. ROTHWELL, HAMILTON, OHIO.

The subject assigned me is one that volumes might be written upon, and he who sells them often finds that stoves are rather a warm subject in more ways than one; for it is a usual occurrence for him to receive cheering and happy greetings from his customers and friends, especially during the first cold snaps of winter.

History informs us that even before the time of Christ the early inhabitants of the old world used braziers, in which they burned charcoal, for the purpose of not only heating the room in which the apparatus was, but by means of hollow walls the heat was conducted to other apartments of the building.

It is generally conceded that the Franklin was one of the first of American stove products, but some of our English brethren contend that our own Benjamin got his ideas from their open fire places.

IMPROVEMENTS IN STOVES.

The old six-plate box heater, for wood, was first made in Ohio about the year 1830, and as there were no foundries west of the Alleghanies the patterns were shipped to Maryland to be cast. The old high oven step stove soon after made its appearance, and as various foundries were springing up in almost every section of the country we find that in the year 1860 many Ohio towns could boast of their foundries making stoves; however, only in a limited manner. The dealer of to-day occasionally runs across one of these old relics, and no doubt it soon finds its way to the old scrap pile.

The ancient type of both heating and cook stoves has been supplanted by the modern steel range, gas range, base burner or air tight, and it can truthfully be said that no household article has had so many improvements or so vast an amount of money expended on it as the kitchen stove or range.

THE STOVE INDUSTRY OF TO-DAY

is quite an important factor in the iron and steel market, being one of the largest consumers. Some of our stove foundries of the present day cover acres of ground, employing hundreds of skilled mechanics, and the owners of which are sparing neither time nor money to make the American stove far superior to any heating or cooking apparatus in the world.

Stoves are nowadays essential to every home, and the dealer should impress on his customers that the peace and happiness of the entire household depend upon the kitchen stove or range, for it is said "the way to the average man's heart is through his stomach."

Living as we do in such a progressive age and with manufacturers of stoves keeping up with, and in many instances ahead of, the procession, it seems hard for the ordinary hardwareman to keep thoroughly posted on round flues, square flues, hot or cold blasts, slide drafts, down drafts or screw drafts, simplex or duplex base burner, air tight or 60-hour heater.

THE RELATION OF THE MANUFACTURER TO THE RETAILER

has been, up to a few years ago, pleasant and profitable, but as conditions have changed certain rules have been adopted by the manufacturers, which have caused some little murmurings of discontent from the retailer, the latter holding that he is compelled to stand the brunt of all complaints and losses. Owing to severe competition in his special district he is not getting profit enough for the amount of work necessary to conduct his business; obliged to claim damage for breakage from transportation companies; compelled to meet price on same make of stoves sold by the crossroad grocery man, who does not carry a line of goods on his floor but simply sells from catalogue. The department store likewise of late makes his business life troublesome. Personally I can say that some of these grievances could be amicably settled if we, as retailers, would keep up with the times and do as our manufacturer does, who is not content with being a member of a national association, but likewise has his Eastern, Western, Southern, Ohio Valley, and in many instances local associations for his protection and welfare.

*Paper read at the eighth annual convention of the Ohio Hardware Association, at Columbus, February 25 and 26, 1902.

HANDLING STOVES.

Permit me, if you please, to enumerate a few of the pleasant and unpleasant features of handling stoves. How pleasant it is, after having driven some 10 or 12 miles in the country, especially on a cold day, to look after a sick stove (one the good housewife claims will not bake on the bottom, cannot do a measly thing with it, is thoroughly disgusted and makes her complaint in such tones that every customer in the store has heard her, says she has tried and tried to bake and she won't try again), to find when you look at the job of setting up this stove that the pipe is too far in the flue, or that the chimney is too low, open grate in the same flue, or the good lady did not know that the damper should be turned up for baking. Then it is that you wonder whether some people have any sense.

Now that gas ranges are being used extensively it is advisable to inform your customer that the pilot is for lighting the oven burners, and that it is practically useless to light burners by holding a match in the air mixer. And we often find that the reason Mrs. Brown's stove does not work satisfactorily is because she wants a range like her next door neighbor. Another very pleasing incident is to have a customer bring back to you a bundle of castings, that will not fit his stove, simply because he gave you the wrong number. But then a stove is such a simple proposition that it should work anywhere, consequently the dealer should be content and always be courteous, for he will undoubtedly receive his reward in the bright hereafter.

Maple Leaf Stoves.

B. C. Beech & Co., Winchester, Ontario, have issued a catalogue devoted to the Maple Leaf stove, showing on the front cover a maple leaf in bronze, upon which is printed a picture of one of their Maple Leaf ranges. This stove is made both as a range and a cooking stove, with 8 and 9 inch holes, and ovens 18 x 19 and 20 x 21 inches. The stoves are provided with indestructible fire backs and duplex grates and with tops made in sections, to insure against cracking. They are also furnished with reservoir and high shelf and all of the modern conveniences. The design, which is elaborate and attractive, is embellished with nickel trimmings. One page of the catalogue is devoted to a crematory closet for use in buildings where is no sewerage and another to the Winchester acetylene gas machine, which is constructed with cast iron generators to operate automatically and made without soldered or wiped joints, having no valves or complicated parts. The machine has been widely sold in Canada, where it is said to have given excellent results. The company have a special catalogue devoted to this apparatus.

An American Heater on a Crater.

"What gratifies all foreigners most after driving three or four hours in a cold wind to the crater of Vesuvius," writes W. E. Curtis, who is traveling in Italy, to the *Record-Herald* of Chicago, "is the presence in the reception room of a Crown Jewel base burning coal stove of American manufacture, giving a warm, cheerful welcome to the chilly visitor." As more than half of the visitors to Vesuvius are said to be Americans, that Crown Jewel is apt to make an impression that will be felt when a stove is needed after reaching home. It might be a good idea to have more Jewels and other American stoves placed where the traveler will form a correct appreciation of their unapproached value, and be induced to ornament his home with such a heater.

THE profits of the John Wright & Eagle Range Company, an English Stove manufacturing concern, for last year, after strengthening the internal reserves, charging directors' fees, managing directors' remuneration and depreciation on the building and plant, amounted to $225,000. This means a dividend at the rate of 6 per cent. per annum, carrying forward $50,000 to reserve fund and $48,000 to next year. It will thus be seen that at least one firm of Range manufacturers in Great Britain is in a very prosperous way.

FURNACE WORK SHOULD BE DONE MORE SCIENTIFICALLY.

BY S. N. D.

Several articles appearing of late in *The Metal Worker* have indicated the increasing popularity of warm air heating for the better class of residences, churches, &c. Whether warm air heating from a central plant is to take its old place and again assume the position it held before it was displaced by direct radiation of steam, and later hot water, depends entirely upon the degree of intelligence used by furnacemen throughout the country.

Fifteen or 20 years ago warm air plants were put in two-thirds by guess work. The cubical air contents of a room was usually figured out, but very little attention was paid to the number of heat units lost in a room through glass or equivalent glass surface. The amount of friction to the air caused by angles in the pipe, the conductivity of materials through which wall pipes are run and their relative exposure, were seldom considered with any care. This haphazard method of installing furnaces and wall pipes caused a reaction against such an uncertain method, and created the demand which resulted in the introduction of direct radiation of steam, and afterward hot water, for the better class of residence work.

Now, however, that brains are beginning to be used in the erection of warm air plants, is there not a growing tendency to return to the older form of heating where it is possible? Is not the sanitary side of direct steam and hot water receiving daily more attention among careful architects and owners? Is it not now beginning to be recognized that a system which makes no provision for the supply of fresh air to living rooms cannot retain permanent popularity? Is not more careful study given than ever before to the best method of keeping a room heated without materially altering the proportion of carbonic acid gas in the air?

These questions are all of vital interest to the furnacemen, because an honest answer will show that a revival of warm air heating for the higher class of residences will surely come if the trade will use their heads as well as their hands in the erection of plants. Within the past two or three years central warm air systems have been installed in some of the largest and most handsome private residences in the country, and have been found to heat them thoroughly and evenly, and at the same time provide a proper supply of fresh air. It has thus been demonstrated that, when attention has been paid to certain fixed natural laws, a warm air system closely approaches the ideal.

If, therefore, a return to furnace heating is due, every one interested should use his best efforts to know how to correctly design and install an entire system in such a way that it will increase the popularity of warm air heating. Furnace work should not be confined merely to making pipes, elbows, setting furnaces, &c.; it should include laying out the plant complete, with due regard to natural laws. The average furnaceman does not realize the supreme importance of these natural laws and their application to his particular business. Air is much more difficult to control than steam or water, and therefore it should receive very careful study.

To make furnace heating a success one should be able to figure not merely the cubical contents of each room, but, approximately at least, the number of heat units lost per hour through the glass, wall and crevices, and through the chimney or ventilation flue. Then he should be able to estimate the size of wall and cellar pipes and registers necessary to deliver the required number of heat units per hour into the room. He should be able to establish a proportion between the equivalent glass surface, cubical contents and capacity of pipe, and take this proportion into account in determining the relative value of each pipe. He should at all times make provision for the length and pitch of pipe, the angles incurred, the location of wall pipes, and the consequent number of heat units lost in passing from the furnace to the room heated. He should be able to figure the proportion between the heating surface of the furnace and number of heat units required. He should know how to figure the velocity of his various pipes at different distances from the furnace. He should also be able to establish the best method of air circulation.

Having treated each room separately, he should then place his heater where, for each pipe, the proportion between the number of heat units required and the pipe area—after due provision is made for length, pitch, angles and exposure of pipes—would be as nearly equalized as possible. He should, of course, know how to figure the required size of his cold air inlet and the best place from which to take his air. Even then the furnaceman would not necessarily make a success of his plant if he did not add to his computation good, hard, common sense. To revive the popularity of furnace heating every man in the trade should have a comprehensive theoretical knowledge. But unless knowledge of this character is generously disseminated for the benefit of the whole furnace trade the knowledge is worthless for advancing the popularity of this method of heating by improving its application.

As soon as the dealer comes to realize that a thorough understanding of his own business is the chief factor in his success and puts his knowledge into practice; as soon as the furnaceman learns to give up saying, "I can do your work cheaper than my competitor," and substitutes, "I can do your work better than my competitor;" as soon as the furnaceman understands that while slipshod work may increase his profits on one job it will eventually bring not only himself, but the whole furnace trade into disrepute, then the popularity of warm air heating will take such a bound that furnacemen will find that they have no "dull season."

STOVE AND FURNACE EXHIBITS AT THE IOWA HARDWARE CONVENTION.

At the fourth annual meeting of the Iowa Retail Hardware Dealers' convention, held at Cedar Rapids last week, the parlors of the Grand Hotel, the official headquarters, were largely given over to exhibits by manufacturers and jobbers and to representatives of trade interests who had secured them for reception purposes. Seldom has a convention been so well served with attractive features of this character. Prominent among the concerns represented were several stove and furnace houses, who made exhibits or distributed souvenirs, among which the following may be mentioned:

The Joliet Stove Works, Joliet, Ill., displayed nine samples of heaters, steel ranges and steel cooking stoves. The ranges comprised Moore's steel range, Moore's Premium range, Moore's Monarch range and Moore's Merit range. The cooking stoves embraced the Steel Gem, a specimen of the first steel cooking stove made, and the Medal, a fine piece of work in the steel line, having an aluminized cast base. The heaters comprised a sample of Moore's original air tight, a standard oak and a hot blast oak. J. B. Reeve and C. L. Featherstone were in charge.

H. L. Mosher and J. L. Parker ably represented the Round Oak Stove Works, Estate of P. D. Beckwith, Dowagiac, Mich. The parlor, known as the Indian Village, was never without callers. They distributed Doe-wah-jack nickel-plated match boxes and Round Oak stick pins.

A. J. Collins of the Majestic Range Company, St. Louis, not only favored his visitors with beautiful aluminum trays, but also each morning decorated everybody's coat with a carnation, and kept the president's table in the convention hall supplied with fresh bouquets.

E. B. Waterman of Black & Germer, Erie, Pa., hospitably entertained his numerous callers. He distributed celluloid buttons bearing a representation of the firm's widely known Air Blast. Mr. Waterman discourses on the merits of Radiant Home stoves and ranges to dealers in Iowa, Southern Minnesota, South Dakota and large lake cities.

L. K. Wynn of the Gem City Stove Mfg. Company, Quincy, Ill., held forth on the merits and original features of the German heater to numerous visitors. His parlor was decorated with festoons of pretzels and

Frankfort sausages, while pictures of Prince Henry adorned the walls, the whole arrangement constituting a striking allusion to the name adopted for the company's popular heater. He distributed artistic stick pins of appropriate design.

The Brown-Hurley Hardware Company, Des Moines, Iowa, exhibited a number of samples of Estate stoves, manufactured by E. and L. Kahn & Bros., Hamilton, Ohio.

The Cole Mfg. Company, Chicago, showed 11 samples of Cole's original heaters. These comprised the well-known Cole's hot blast for coal and air tight for wood. The hot blast stove was shown in five sizes, running from the smallest pattern to a mammoth construction. The air tights were shown in six styles and sizes, embracing a variety of types and finishes. E. L. Duquette was in charge.

The Peninsular Stove Company, Detroit and Chicago, exhibited a large number of photographs of their stoves and ranges. They further exhibited models of the Peninsular line of furnaces. W. R. Yandall, manager of the company's Chicago branch, was in charge, assisted by H. L. Rossman, A. J. Ross and H. P. Knowlton. They distributed leather-covered memorandum books, which were highly appreciated.

W. C. Henry, representing Taplin, Rice & Co. and May & Fiebeger of Akron, Ohio, displayed a number of photographs of the former's Climax stoves and ranges and showed models of the latter's air blast furnaces.

W. J. Heald, representing the Lenox Mfg. Company, Marshalltown, Iowa, exhibited a model of their Torrid Zone furnace, as well as samples of the Wireton time draft regulator and the improved Orr register.

Among those representing similar interests, the following were in attendance at the convention:

John K. Wilson and W. B. Barney, Fuller-Warren Company, Milwaukee, Wis.
William Snell, C. Sidney Shepard & Co., Chicago.
J. H. Farquharson, M & D Range Company, Chicago.
Chas. Smith and C. V. Riley, Chas. Smith Company, Chicago.
J. W. Patterson, Cribben & Sexton Company, Chicago.
George E. Willsie, Keith Furnace Company, Des Moines, Iowa.
A. X. Smith, Quick Meal Stove Company, St. Louis, Mo.
J. C. Bosworth and C. W. Stewart, Michigan Stove Company, Detroit and Chicago.
A. A. Swan, Economy Furnace Company, Cedar Rapids, Iowa.
P. A. Pamplin, Buck's Stove & Range Company, St. Louis, Mo.
F. T. Carroll, Malleable Steel Range Company, South Bend, Ind.
I. M. Walters, Bridge & Beach Mfg. Company, St. Louis, Mo.
E. H. A. Van Sittert, Culter & Proctor Stove Company, Peoria, Ill.
A. B. J. Moore, Rock Island Stove Company, Rock Island, Ill.
H. H. Roberts and Geo. W. Cope, *The Metal Worker*, Chicago.

SOME DATA FOR FURNACEMEN.

BY S. D.

The correspondence which I have had with another furnaceman resulted in the following questions being presented to me for answers, and as I see that furnacemen are now all looking to *The Metal Worker*, on account of its interesting articles on furnace work, I give the questions received and the answers sent in return as of possible interest. I hope that furnacemen who can answer any of the questions better or who think my answers need supplementing will not hesitate to give their views and practice.

THE QUESTIONS.

How many heat units do you calculate are lost through glass?

How do you calculate the equivalent glass value of brick and frame buildings?

On what basis do you calculate the grate surface necessary for heating a building?

Has the grate surface any relation to the glass surface, equivalent glass surface or space heated?

What allowance do you make between church, school and residence heating?

On what basis do you arrive at the size of wall and cellar pipes?

What proportion do you consider necessary between the cellar pipe and flue area and the space heated and equivalent glass surface?

How much do you calculate is the loss in heat units in the hot air pipe between the furnace and the register?

How do you calculate the heat units derived from the heating surface in a furnace for heating a building?

What do you rate the difference in velocity in hot air pipes of different size and length to different floors?

THE ASSISTANCE TENDERED.

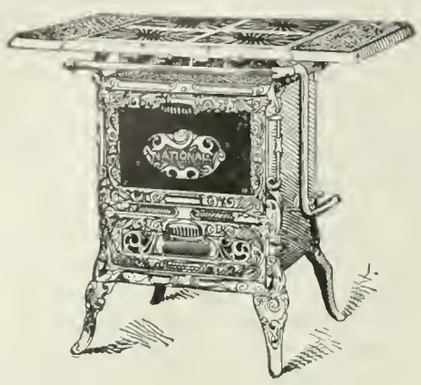
Those who read these questions will see that I had to do some studying and reading that is ordinarily out of the furnaceman's line; but as I had volunteered I felt the necessity of rendering some assistance, if not furnishing answers. My answers may seem unsatisfactory to the graduated engineer as well as to those eager for information, but such as they are, here they are:

It is more or less difficult to give any fixed rule of proportion for all furnaces, as they vary so much in heating surface. The proportions I use are those which tests have proven are best adapted to the particular apparatus I am interested in. To reply to the various questions, I would say:

It is generally accepted that the heat transmission of glass is approximately 80 heat units per square foot per hour when the inside temperature is 70 degrees higher than the outside.

Pine has about one-sixth the heat conducting power of glass, oak about one-fourth, brick about three-fourths. As frame buildings cannot be constructed as tight as brick, the relative heat transmitting power of brick and wood can, for practical purposes, be reckoned at approximately the same. If the building is of brick or frame, well built, the proportion between the heat units lost in wood, brick and plastering and the number lost in glass is about 8 to 1. If the building is of frame, poorly constructed, the ratio should not be over 5 to 1. The ratio for floors over cellar and ceilings under attics should be about 12 to 1. Outside doors should be about 2 to 1. Of course to reduce the frame and brick surface to equivalent glass surface, divide the exposed wall surface by 12, 8, 5 or 2, as the case demands. Add this result to the glass surface and you have the equivalent glass surface.

Your two questions in regard to the basis of calculation of the grate surface necessary for heating a building, and whether or not it has any relation to the equivalent glass surface or space to be heated, seem to be so closely allied that they do not appear to require separate answers. I have no fixed rule for all sized furnaces, but, speaking in a somewhat general way, I usually figure that 1 foot of grate surface will take care of about 600 square feet of equivalent glass surface and from 7000 or less to 12,500 cubic feet of contents. Personally I prefer to use the heating surface as a source of deduction. Although 1 square foot of iron surface has about 35 times the radiating power of glass, the number of heat units lost in the pipe and by ventilation will make the proportion 1 square foot of heating surface in heater to 15 of glass.

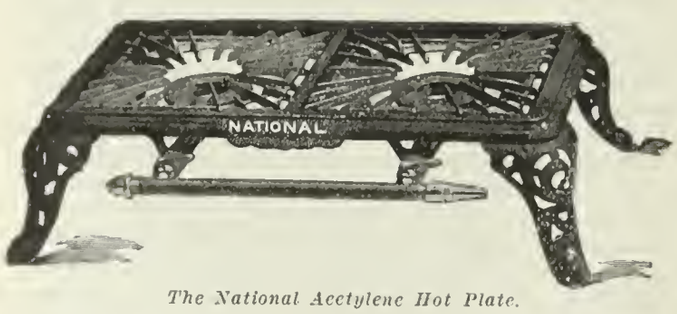


The proportion between piping and cubical contents and equivalent glass surface is dependent to an extent upon the pitch, length and angles of pipe, and the importance and character of the room to be heated; but when allowance is made for these points the proportion should be, in my opinion, about 1 square inch of pipe area to about 32 cubic feet of air space, and about 1 square inch of pipe area to about 1½ square feet of equivalent glass surface.

The loss of the heat units between the heater and the registers is dependent upon the temperature of the air inside the pipe and outside and the length of the pipe. Tin, unprotected by asbestos paper, has about 30 times the heat transmitting power of glass. From this it is not a difficult matter to compute the number of heat units lost in a cellar or outside wall.

The South Pittsburg Stove & Foundry Company's plant at South Pittsburg, Tenn., consisting of Stove and Soil Pipe foundry, mounting and finishing sheds, warehouses all fully equipped with modern appliances, and 11 acres of land in the center of the town, together with stock of made up Stoves, has been sold to A. G. Riley of Huntington & Riley, Memphis, Tenn., for about $36,500. It is said that the new owners will operate the plant at an early date.

The National Acetylene Gas Stoves.



The excellence of acetylene gas as an illuminant has led to the wide introduction of acetylene gas generators throughout the country, and with this has come the demand for a heating and cooking apparatus to use the same gas. Some difficulty has been experienced heretofore with the production of a practical stove. In the accompanying illustrations we show the National acetylene cooking stove and hot plate, made by the National Stove & Illuminating Company, 909 New England Building, Cleveland, Ohio. The National four-burner range and oven is shown in Fig. 1. The success of this stove is

The National Acetylene Gas Stoves. Fig. 1.—Four-Burner Range with Oven.

said to be due to maintaining under all conditions a proper proportion of air and gas in the mixture sent to the burner, which result has been accomplished by means of the special construction presented in the National stove. Another drawback that has been experienced with all gas stoves is flashing back, or lighting back to the gas supply orifice. This, it is claimed, has been entirely overcome in the National stove, and the air mixer is so constructed that it can be readily adjusted to suit any conditions. The combustion is also of such a character as to generate the desired heat without waste, and the advantage of the gas stove can be enjoyed by those who have an acetylene lighting plant under economical conditions.

In Fig. 2 is shown a two-burner hot plate adapted for acetylene gas. The company claim that these stoves, with a small consumption of gas, generate a great heat

The National Acetylene Hot Plate.

without odor. The flame is clean and they operate under a pressure of 2½ inches of water and upward. The gas is burned from 3-16-inch holes in the burner, which prevents choking up or overheating. The company issue, under date of March 1, a neat catalogue and new trade price sheet, giving full particulars of their goods. They also manufacture acetylene burners for lighting purposes.

The annual meeting of the Fuller & Warren Company was held on March 5 at the general offices of the company in Troy, N. Y., when the following directors were elected to serve for the ensuing year: John Johnston, J. A. Roundy, William Plankinton, George L. Graves, H. A. Viets, J. E. Hansen and Arthur N. McGeoch, all of Milwaukee, and W. P. Warren, Troy, N. Y., and Walter Thompson, Garretson, N. Y. Of these the only new member of the board is Mr. McGeoch. The annual report showed the company's business to be in a gratifying condition. During the past year the concern have erected a large addition to their plant, and at the present time the entire plant is being run to its fullest capacity.

WHAT A FURNACEMAN SHOULD KNOW.

BY H. M. K.

Referring to the article by "O. N. E." in *The Metal Worker* of March 1, I would say that a furnaceman of any experience should know, first, that it is an utter impossibility to force cold air from the floor of a room down stairs, then up a cold flue between studding into a cold air attic, by simply letting warm air from a register over the furnace into the room. In cold weather my experience has been that cold air rushes down from the attic, and in order to get the circulation "O. N. E." writes about one should have a warm flue. Secondly, in the way builders now construct wooden houses with balloon frames there is no such flue between the studding extending from cellar to garret. At every story, if not oftener, headers are put across, filling up the space between the studs, rendering it impossible oftentimes to run even a gas pipe up between the studs without a good deal of trouble.

I recently had some experience in ventilation for the circulation of air in a church where eight or ten flues in brick outside walls had been left extending from basement to attic, the attic being well ventilated. At the base of the flues in the audience and class rooms wheel registers had been placed to allow the escape of the foul air from the floor to the attic, as "O. N. E." suggests. Now the theory that the cold air will be forced up by the warm air sounds very well, perhaps, but the actual experience was that cold air came rushing down these flues, making it not only necessary to close those wheel ventilators, but to keep them closed or freeze out the audience. By putting a gas pipe round the room and putting a gas jet with a Bunsen burner into each flue we overcame the difficulty and secured a splendid circulation, but the gas bills were "out of sight," and the project, after a few months, was abandoned and the wheel ventilators closed again on account of the expense.

Theory and practical experience are two different things. How to exactly control air currents in furnace heating is a problem not yet solved by a long way. Referring to the editorial on "Furnace Air Supply" in the same issue of *The Metal Worker*, I would say that my experience is that a liberal supply of indoor air taken through a register in a hall, especially since *portières* are used in place of doors, is the most satisfactory and economical way of supplying a furnace with air. I will confess that my ideas have changed in 25 years of experience along these lines. I think both inside and outside air supplies are best, as the cold air from outside is often shut off in severe weather, while with a double supply it may be shut off without disadvantage to the furnace.

ODD PLATES.

The Excelsior Steel Furnace Company, Chicago, after negotiations covering several months, have made arrangements for the enlargement of their quarters at 38 and 40 West Monroe street. They will add three more stories to the rear of their building, covering a space of 44 x 100 feet. This enlargement will give the company nearly 20 per cent. of increased floor space. They have occupied this building for nearly ten years, and during that time they have considerably increased its size. The company have further secured options on about 20,000 feet of space in an adjoining building, of which they expect to get possession in a few months. They will then have in use over 2 acres of floor space.

The Columbus Stove Works, which began operations July 1, 1901, at Columbus, Ohio, were incorporated at the beginning of the year under the title of the Columbus Stove Company. The business since its inception has been successful, the company leasing the entire plant of the old Eugler Foundry on Main street, in order to meet the demand for their principal product, the Columbus Steel Plate Range, which embodies many features of merit and is adapted for hard or soft coal, coke,

wood or natural gas. Since taking possession of the foundry the company have entirely remodled it and equipped it with the latest improved machinery especially adapted to their work. The directors of the company are: F. B. Everett, president and treasurer; John W. Hastings, vice-president and manager; J. C. Campbell, G. A. Welling of the Welling Mfg. Company and L. Ewing Jones. J. W. Hastings, the founder and manager of the business, has had over 20 years' practical experience.

The Ferris Stove Company, St. Louis, Mo., have secured control of a lot 280 x 137 feet at Twenty-second and Pepin streets, and will, it is said, erect thereon a large manufacturing plant.

The Economy Furnace Company, Cedar Rapids, Iowa, are manufacturers of Hot Air Furnaces of the tubular type and the divided flame type. The tubular type has a number of vertical cast iron flues through which the air passes when heated, while the divided flame type has the dome over the fire pot connected with the radiator by special openings on the circumference, thus dividing the flame into several columns, allowing a free mixture with air in insuring complete combustion. The divided flame Furnace is especially suited for the use of soft coal for fuel. The company are heating and ventilating engineers and take contracts for heating large buildings, such as court houses, schools, &c. A. T. Averill is president, George B. Dutton vice-president, W. H. Durin secretary, Glenn M. Averill treasurer, and E. R. Swan general manager. Mr. Swan was for many years connected with the Williamson Heating & Ventilating Company of Cincinnati as heating engineer.

Charles Nowak, who for 22 years had been employed by the Cribben & Sexton Company, Chicago, died suddenly in that city on the 6th inst., from an affection of the heart. Mr. Nowak had for many years been the company's Chicago salesman and was widely known and highly esteemed in the local Stove trade. A widow and several children survive him.

The Cook & Van Evera Company, 38 and 40 Lake street, Chicago, are Western agents for the sale of the Enterprise Odorless Instantaneous Blue Flame Oil Stove. This is a Stove which burns with a wick. The burner, however, is constructed on a new principle by which two currents of air are so commingled in securing the combustion of the oil that when the wick is raised to the proper hight the flame thus made is perfectly blue and produces an intense heat. The peculiarity of this burner is the fact that it lights instantaneously and emits no odor, either when the flame is first started or when it is extinguished. The wick raising device is new and is claimed to be constructed on a principle which prevents it from getting out of order. The wick is round and very thick and one will last an entire season. The Cooking Stoves made on this principle comprise a full line of two or three burner Stoves which are handsomely constructed with sheet steel frames, designed in cabinet styles.

Caldwell Furnace Foundry Company of 419 Market street, Camden, N. J., have been incorporated to manufacture Furnaces, &c., with a capital of $300,000, by James W. Caldwell, Curtis F. Johnson and Charles R. Clapp.

IOWA RETAIL HARDWARE DEALERS' ASSOCIATION.

In our issue of last week we printed a report of the proceedings at the opening of the fourth annual meeting of the Iowa Retail Hardware Dealers' Association, held at Cedar Rapids on March 4, 5 and 6. At the session on Wednesday morning Chairman Jacob Seither of the Executive Committee reported that the books of the secretary and treasurer had been audited and found correct.

President W. A. McIntire then read his annual address, which was vigorously applauded and awarded a rising vote of thanks. The president appointed a Press Committee consisting of S. R. Miles of Mason City and George W. Cope of *The Metal Worker*.

At the evening session members of the Executive Committee for the ensuing year were elected as follows, each Congressional district being entitled to a representative of one member on this committee:

1. Jacob Seither, Keokuk.
2. Clarence Philips, West Liberty.
3. L. Lindenberg, Dubuque.
4. T. J. Lomas, Cresco.
5. C. S. Schmidt, Marshalltown.
6. Homer M. Duncan, Albia.
7. L. H. Kurtz, Des Moines.
8. C. R. Keating, Mt. Ayr.
9. Charles Swaine, Council Bluffs.
10. H. S. Vincent, Fort Dodge.
11. W. H. Millard, Cherokee.

The appointment of the following committees was made by the president:

Resolutions: Charles Swaine, Council Bluffs; J. F. Nelson, Fort Dodge; N. B. Twogood, Mount Vernon.
Constitution: H. S. Rayhurn, Mason City; Clarence Philips, West Liberty, and L. H. Kurtz, Des Moines.
Nomination of Officers: L. Lindenberg, Dubuque; G. H. Thorley, Atlantic, and George Staehle, Earlville.

S. R. Miles of Mason City read a paper on "Credits," which was discussed at great length, the subject proving to be of much interest to the members, and C. F. Schmidt of Marshalltown read one on the "Relation of the Jobber and Retail Dealer."

On Wednesday afternoon H. G. Cormick of Centralia, Ill., treasurer of the National Retail Hardware Dealers' Association and president of the Illinois Retail Hardware Dealers' Association, addressed the convention, after it had spent some time in executive session.

At the Thursday morning session Clarence Philips read the report of the Committee on Constitution, in which several changes were recommended, some of which were adopted and others rejected. Papers were then read by George Staehle of Earlville on "Trusts in Their Relation to Retail Dealers," and L. Lindenberg of Dubuque on "Our Competitors."

Charles Swaine reported that the Executive Committee had held a meeting and had elected W. H. Keating of Ottumwa secretary and George S. Lister of Manchester treasurer for the ensuing year. They recommended the following to serve as members of the Grievance Committee: S. R. Miles of Mason City, W. H. Millard of Cherokee and E. P. Messer of Sheldon. They also recommended that the president and secretary be empowered to appoint an assistant secretary, if in their opinion he might be needed. This was for the purpose of securing a canvasser to travel through the State soliciting new members. The report was adopted.

Mr. Swaine also presented a report from the Committee on Resolutions, which was adopted, as follows:

Resolved, That we, the Hardware dealers of Iowa, in convention assembled, reiterate our loyalty to our association and to the National Association, and pledge ourselves to do all in our power to further the objects of both.

Resolved, That we heartily indorse the action of the National Association in trying to persuade the manufacturers and jobbers to refrain from selling to catalogue houses and direct to consumers.

Resolved, That we indorse the action of all manufacturers and jobbers who have pledged themselves to refrain from selling to catalogue houses and consumers.

Resolved, That we tender a vote of thanks to the citizens of Cedar Rapids, especially to the Young Men's Christian Association and the Commercial Club, for their hospitality and courteous treatment during our stay in the city, and to the local and trade papers for their kind consideration.

Resolved, That we are indebted to President McIntire and Secretary Keating for the effective manner in which they have conducted the affairs of the association for the past year.

L. Lindenberg of the Committee on Nomination of Officers reported the following list:

President, W. A. McIntire, Ottumwa.

Vice-President, Jacob Seither, Keokuk.

The report was adopted and the gentlemen named were elected.

The president thanked H. G. Cormick for his presence and assistance, and requested the convention to manifest their concurrence in his sentiments by a rising vote, which was accordingly done. The convention adjourned *sine die*.

The Executive Committee held a meeting on Thursday afternoon and elected President W. A. McIntire and Secretary W. H. Keating as delegates of the Iowa Association to the National Association.

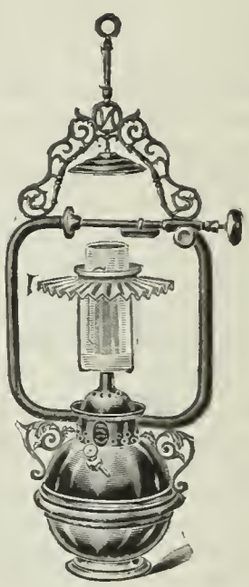
National Retail Hardware Dealers' Association.

The third annual meeting of the National Retail Hardware Dealers' Association will be held on Wednesday and Thursday, March 19 and 20, at the Palmer House, Chicago. All the sessions will be of an executive character. Two delegates from each of the following States, together with some of the State officers, will comprise the gathering: North Dakota, Iowa, Missouri, Arkansas, Illinois, Wisconsin, Indiana, Kentucky, Michigan, Ohio, Pennsylvania, Kansas and Minnesota. We are advised by M. L. Corey, Argos, Ind., secretary of the association, that reduced railroad rates can be obtained by most of the delegates on the certificate plan through the National Association of Merchants and Travelers.

The official manual and directory of the association was issued a short time since. It contains more than 100 pages and presents a variety of matter pertaining to the association, including the aims, objects and resolutions of the organization, constitution and by-laws, portraits of National and State Association officials, directory of State associations and a complete list of the individual members of the National Association in the different States comprising it. The manual does not, of course, reflect the condition of the association at the present time, as some strong State association which have lately affiliated with it are not represented. It is, however, an impressive exhibition of the growth and power of the association movement, and will serve a useful purpose in directing the attention of manufacturers and jobbers, as well as retail merchants themselves (especially those not now members of a State association), to the important influence which such an organization must have on the welfare of the retail hardwaremen of the country.

Death of George B. Miller.

George B. Miller died at his residence in Brooklyn, N. Y., on March 5, of pleuro-pneumonia, after an illness of ten days. Mr. Miller was born in Brooklyn in 1852, and, as a boy, in 1867, was one of the first to be empolyed by U. T. Hungerford, who a short time previously had assumed the management of the New York branch of Wallace & Sons, Ansonia, Conn., manufacturers of brass and copper goods. After serving the house in various minor capacities for several years, Mr. Miller became the city salesman, and in 1877 represented their interests on the road, covering the whole of the United States, from the Atlantic to the Pacific, and from Canada to the Gulf of Mexico. In January, 1892, he went to Chicago to assume charge of Wallace & Sons' lamp department, and remained there until the following year, when he returned to New York to take charge of their lamp department in that city. In June, 1896, when Wallace & Sons went out of business, Mr. Miller became identified with the Bridgeport Brass Company, with whom he remained for two years, when he associated himself with Edward Miller & Co. of Meriden, Conn., and New York, who are well known makers of lamps. After a period of four years in their employ he, on January 1, 1902, began to travel on his own account, representing a number of manufacturers among the wholesale trade, on a commission basis. Mr. Miller was possessed of a genial temperament, and had a host of friends in and out of the trade. He was an industrious and untiring worker and a popular and successful salesman, and was one of the best known traveling men in the brass and copper line. He is survived by a widow and one daughter.



C. Sidney Shepard & Co.'s Fire.

A fire on Wednesday night almost completely destroyed the stock of C. Sidney Shepard & Co., Chicago, with a loss of not less than $100,000. A temporary office has been opened with the Tuttle & Bailey Mfg. Company at 49 Lake street, and all orders for the Chicago trade will be promptly filled from the company's St. Louis house. They expect to return to the same building as soon as the owners can rebuild it, and efforts are being made to have it ready by the latter part of April. Owing to the ample resources of the house it is improbable that their customers will experience any annoyance by reason of the fire and that orders placed with them will be filled with the same high class goods and promptness that have made the concern popular with the trade.

The Nulite Indoor Arc Illuminator.

An illustration is herewith given of a powerful incandescent vapor gas lamp, designed expressly for indoor illumination, which has been brought out by the Chicago Solar Light Company, 132 and 134 Lake street, Chicago. This lamp is rated at 750 candle-power, and the manufacturers claim that it is superior to either electricity or gas and at one-tenth the cost. It is so constructed that it will hang or stand anywhere. The total length of the lamp is 33 inches and the spread of the arms is 12½ inches. It is finished in oxidized copper, lacquered, and has a heavy brass reservoir, having a capacity of 2 quarts, which leaves room for air, it being operated under air pressure. This lamp, it is stated, will burn from 12 to 17 hours.

The generating tube is claimed to be a perfect generator. It is of extra thickness, made of the very best

The Nulite Indoor Arc Illuminator.

seamless brass tubing, retains the heat, and is not affected by cold drafts or cold temperature. The generating stem is made of the best quality of brass rod, accurately turned and fitted. A simple and ready method is provided for removing the generating stem for cleaning, together with an automatic cleaning needle to clean the vapor hole in the tip. A perfect shut off valve, known as the needle valve, is provided at the point of contact between the generating stem and tip, which can be used either to shut off the light entirely or to regulate the flow of gas. The reservoir is made of solid brass of heavy gauge and stands a pressure, laboratory test, of 350 pounds, while only about 30 pounds are required in ordinary use.

Union Furnace Mfg. Company.

Union Furnace Mfg. Company, with main offices at Altoona, Pa., and works at Union Furnace, Pa., have recently established a branch office in the Drexel Building, Fifth and Chestnut streets, Philadelphia. This office is under the personal management of W. C. Moore, a stockholder in the company and one of their organizers. The company are producers of pressed steel specialties, the output of the works including Wolf's pressed steel registers, curry combs, galvanized oil cans, fire shovels, hoes, garden trowels, washers, stove boards, shelf brackets, barrel bolts, coffee mills, &c. A specialty is made, however, of shovels, spades and scoops. The company advise us that they are now in position to furnish solid plain back and riveted shovels in connection with their hollow back shovels, which they have been manufactur-

ing for some time. The capacity of the shovel plant is 150 dozen a day. Mr. Moore is also representing the Monarch Powder Company, an allied concern, who make a specialty of blasting powder for mining purposes. Both plants are operated by electricity, the power being obtained from the Juniata River.

Letter from the Trade.

Defective Goods.

The following communication from a merchant of New York State is in answer to the inquiry of a correspondent whose letter appeared in our last issue:

Referring to your issue of the 1st inst., regarding defective goods, would say the dealer purchasing goods not warranted should be governed by a little good sense, and not make claim for damage, knowing at the time he bought them they were bought at less than market value, and should be willing to stand any loss that might come from them.

Had the customer bought the same article at a Jabberwock or department store he would not have thought of returning it, but because this man is doing a legitimate business thinks to impose upon him. By no manner of means has this man any claim on manufacturer or dealer.

Sterling and American Queen Lemon Squeezers.

The accompanying cuts illustrate two of the 1902 lemon squeezers put on the market by the Logan & Strobridge Iron Company, New Brighton, Pa. The squeezer shown in Fig. 1 is large, and is much stronger than others of the same capacity made by the company.

Fig. 1.—Sterling Lemon Squeezer No. 16.

The arrangement of the pressure bowl and bob is such that the rind of the lemon, when under pressure, spreads instead of curling inward, as is the case, it is remarked, with the ordinary shaped bowl. This arrangement, it is explained, extracts all the juice, whereas the old style allowed some of the juice to remain in the curled up edges of the rind. The manufacturers state that it is

Fig. 2.—American Queen Lemon Squeezer No. 18.

made of the best quality of iron, coated all over with pure tin. In Fig. 2 is shown a squeezer and juice extractor combined. The cup is detachable, and can be used by itself as a juice extractor. By a slight turn of the thumb, after the cup is placed in the frame, it is as securely fastened as if made solid with the frame. It is stated that it is quite as easily and quickly detached for cleaning or for use as an extractor. The frame and handles are finished in japan, while the extractor cup is tinned all over with pure tin.

JOHN T. COCKEY, a son of Joshua F. Cockey, president of the National Bank of Cockeysville, Md., has become a partner in the firm of Timothy Ryan & Co., manufacturers of Tinware, Baltimore, Md.

Stove and Hardware Dealers.

AT a recent meeting of the stockholders of the Witte Hardware Company of St. Louis, Mo., it was decided to increase the capital stock from $150,000 to $300,000, and this has been fully paid in. They will largely increase their facilities in order to better take care of their enlarging business, which they state is gaining at a rapid pace. The company have in preparation a new catalogue, which will contain 1600 pages, being just double the size of the previous ones. It will be ready for distribution shortly.

THE J. W. JORDAN COMPANY of Worcester, Mass., recently incorporated, to deal in Stoves, Ranges and Furnaces, and to do a combination hot air and hot water heating and sanitary plumbing business at 609 to 611 Main street, are the successors of J. W. Jordan & Co., the business of whom was owned by Frederick B. Jordan, who succeeded to it on the retirement of Henry McManus. The firm are one of the oldest in their line in Worcester, having been founded by the late J. W. Jordan half a century ago. The incorporation of the concern has been made with the intention of materially increasing the scope of their business.

THE WILLIAM FRANKFURTH HARDWARE COMPANY, Milwaukee, Wis., have nearly completed a very large new building on West Water street in the jobbing center of the city, into which they will shortly move their large stock of goods. The new structure is 150 x 150 feet square, and is of three stories with basement. The firm handle a large line of Shelf Hardware, Tin Plate and Metals, Tools, &c.

THE TRENTON LAMP & MFG. COMPANY, Trenton, N. J., have been incorporated with a capital of $150,000 by A. Fondeville, H. Van Iderstine and Charles Womwell to manufacture Lamps, &c.

THE ANSCHUTZ MFG. COMPANY of Franklin, Ind., have been incorporated with a capital of $10,000 to manufacture Dust Pans. The directors are Mary E. Anschutz, Frank D. P. Anschutz, John T. Adams and Claude E. Lee.

ED. C. WHITLOCK has purchased a stock of Hardware at Kinross, Iowa, and will also handle Stoves, Bicycles, Pumps, &c., operating a tin shop for roofing and general repairing. He desires catalogues and price-lists.

FIRE recently destroyed the store of the Clayton Hardware Company, Goldfield, Col. The insurance of nearly $6000 covered the loss. The company will rebuild with a brick structure, 50 x 125 feet in dimensions, two stories high. Their line embraces Shelf and Heavy Hardware, Stoves, Tinware, Sporting Goods and Miners' Supplies. They have discontinued their Denver store.

THE partnership in the Hardware Stove and Plumbing business in Troy, Ohio, formerly existing between Mary J. Hayner and H. A. Cosley, under the firm name of Harter & Cosley, has been dissolved. Mary J. Hayner has sold her interest to Mr. Cosley, who will continue the business under his own name. This business was established by S. K. Harter 57 years ago, and Mr. Cosley has been identified with it for the past 30 years.

THE GURNEY REFRIGERATOR COMPANY of Milwaukee, Wis., are reported to have recently secured a contract calling for the shipment of some 120 Refrigerators of various sizes to Honolulu, Hawaiian Islands.

THE Board of Trade of Middletown, Conn., according to a local report, are negotiating with Louis Haberman, formerly superintendent of the Eastern Tinware Company at Portland, with regard to locating a plant in Middletown.

HENRY D. HEDGES will open a new Hardware and House Furnishing Goods store in the Grimshaw Block, East Hampton, N. Y., on April 1.

THE BENBOW-BRAMMER MFG. COMPANY, manufacturers of Washing Machines, at 5215 McKissock avenue, St. Louis, Mo., suffered a loss of between $30,000 and $40,000 by fire last week. The loss is partially covered by insurance.

House Gas Piping.*

BY C. S. GRISWOLD.

In the spring of 1899 we put in execution a plan we had for the piping of houses situated along the line of our main in which gas had never been used for lighting. The introduction of gas stoves, with one light over the stove, has caused the people to inquire the cost of piping their houses, but in many instances the expense was so great it seemed to them exorbitant. These houses were in most cases owned and occupied by mechanics whose only income was their daily pay. After conferring with the local gas fitters we established a price for both concealed and exposed piping, with fixtures and globes complete, ready to light, with stove connection (where one was not already in), for $11 and $15 respectively for four rooms, every additional room being $2 extra. We also gave a price without fixtures. We contracted with a local firm who manufacture gas fixtures to supply what was needed. They designed one especially for us. We carry but two styles and prices of fixtures.

During that year we piped 128 houses, the local fitters doing most of the work, at $2.50 an opening, concealed piping. This was done without any canvassing other than the distribution of circulars and newspaper advertising.

At the close of the season the gas fitters thought there was not money enough in it for them, as the price of pipe had advanced. We therefore concluded to do our own piping, employing the men who had been setting stoves for that purpose. The plan of doing our own work gave better satisfaction, both to the consumer and to the company, more especially to the consumer, for in many instances one might wish a slight change from the original order, which can be made by the company at a nominal cost; and it more than pays, for it pleases a customer. In all cases trying to please a customer pays, for it brings new business and is a cheap way to advertise. To do this no large outlay is necessary, but careful attention to smaller details will usually accomplish it.

During the year 1900 we continued the same plan, but raised the price to $13 for our A grade and $18 for our B grade of fixtures for four rooms. That year we piped 142 houses and also furnished quite a number of fixtures to houses already piped.

In 1901 we changed the style of fixtures, but only carried two styles and prices as before. For the year we have piped 109 houses.

The houses piped are usually from five to ten rooms. Only the very best black pipe is used and galvanized fittings. Our fitters are of the best, and some of them have been in our employ five years. Some who came to us as helpers are the best fitters we now have. They have been taught to think and work quickly, to use as little pipe and as few fittings as practicable, and have the work well done. In my experience as inspector of gas piping I find that gas fitters in general use too much gas pipe and too many fittings. Another difference between our fitters and regular plumbers is in the use of fittings. They use L's where they can; we use T's, for the reason if changes were to be made they could be accomplished more easily and much cheaper than when a line has to be cut to insert a T. Another advantage is, if from any cause there is a stoppage in the pipe you can more readily and with less expense remove the obstruction.

The sizes of pipe are mostly ¾-inch, ½-inch, ⅜-inch. Risers are never less than ¾-inch; stove pipe, ¾-inch; house runs, usually ¾-inch; if not very long, ½-inch; never but one opening off ⅜-inch. The reason galvanized fittings are used is there is less liability for sand holes than with black fittings.

The fitters must be courteous, quiet, quick and neat; quiet about the house, quick to think and work, and neat about their work. One who is used to piping will always try to get his riser so that he can extend from it with as few angles and as few cuts in the floor as possible. Of course some houses are harder to pipe than others. Those with double floors, or floors deadened with cement (our price is $3 extra for such), make a slight difference, but less than many would think. Gas pipe is small and takes up but little room.

Some people have said, "I should think the local plumbers would be down on you." Not necessarily; they could not get this work, or very little of it, for they cannot afford to do it as cheap as the gas company, and as the gas company does not do any new work there is no conflict between us. We are on the best of terms.

The net loss per installation, when plumbers were doing the piping, was $6, but now that our men do the work and have become more experienced the loss is practically nothing.

This year we expect to introduce a new plan. We will set a stove, with one light over it as usual, and pipe (exposed piping) for two additional lights, either side bracket or single pendant, at an estimated cost to us of $15. To collect this amount we propose to set the slot meter at a sufficient advance to enable us to get returns in five years, at which time the outfit belongs to the consumer. This will give us the opportunity of reaching a class of customers never before obtained.

* Paper read at the thirty-second meeting of the New England Association of Gas Engineers.

Change In New York Plumbing Ordinance.

For some time a special type of fresh air inlet guard has been required in Brooklyn, but through the efforts of the Master Plumbers' Association the ordinance has been amended so that the use of the patented device is no longer mandatory, and Section 79 now reads as follows:

Section 79. A fresh air inlet must be connected with the house drain just inside of the house trap. Where underground it will be of extra heavy cast iron. It must extend to the outer air, and finish with a return bend, at least 1 foot above the grade and 10 feet away from any window or cold air box. An automatic device approved by the Superintendent of Buildings may be used when set in a manner satisfactory to the said Superintendent.

The amendment was adopted about the middle of last month by the building superintendents of the five boroughs.

License Required to Disconnect Boiler?

The advisability of having the house drainage system protected by suitable regulations and constructed or altered only by plumbers who have shown their competency and taken out a license has been demonstrated. But when there is an endeavor to prevent any workman from disconnecting a kitchen boiler or connecting it with a range the object is open to reasonable question. Similar efforts to reserve this class of work to licensed plumbers have been made in the past, and some interest will be taken in the result of a request made by a citizen of Washington to the commissioners of the District of Columbia to give a decision on this point. The following on the subject is from the Washington *Star:*

The District Commissioners recently received a letter from Walter J. Wheatley, requesting a ruling as to the status of steam and hot water pipe fitters in regard to plumbing work, and especially in regard to certain work done by Peter J. May. O. L. Ingalls, the Inspector of Plumbing, has reported to the Commissioners that the inquiry originated in the removal of a hot water kitchen boiler, used for domestic purposes, from an upper floor to the basement of premises 2100 Fourth street, northeast. The water pipe connections to this boiler were made, it is alleged, by Mr. May, an unlicensed plumber, who, in Mr. Ingalls' opinion, clearly violated the plumbing regulations, and, he says, Mr. May would have been prosecuted had it not been for lack of evidence as to date and other details.

Mr. Ingalls says that the work done was clearly that of plumbing and should have been performed by a registered plumber or his employee, as provided for in the act of Congress approved June 18, 1898. He says further that in all new houses the plumber provides a connection at a convenient place, controlled by a valve or stop cock, for the service of hot water boilers, and he says that no objection has been made to a steam fitter connecting the boiler at the point designated. When no such provision exists, then Mr. Ingalls thinks that it is clearly the right of no one but a registered plumber or his employees to make the requisite connections.

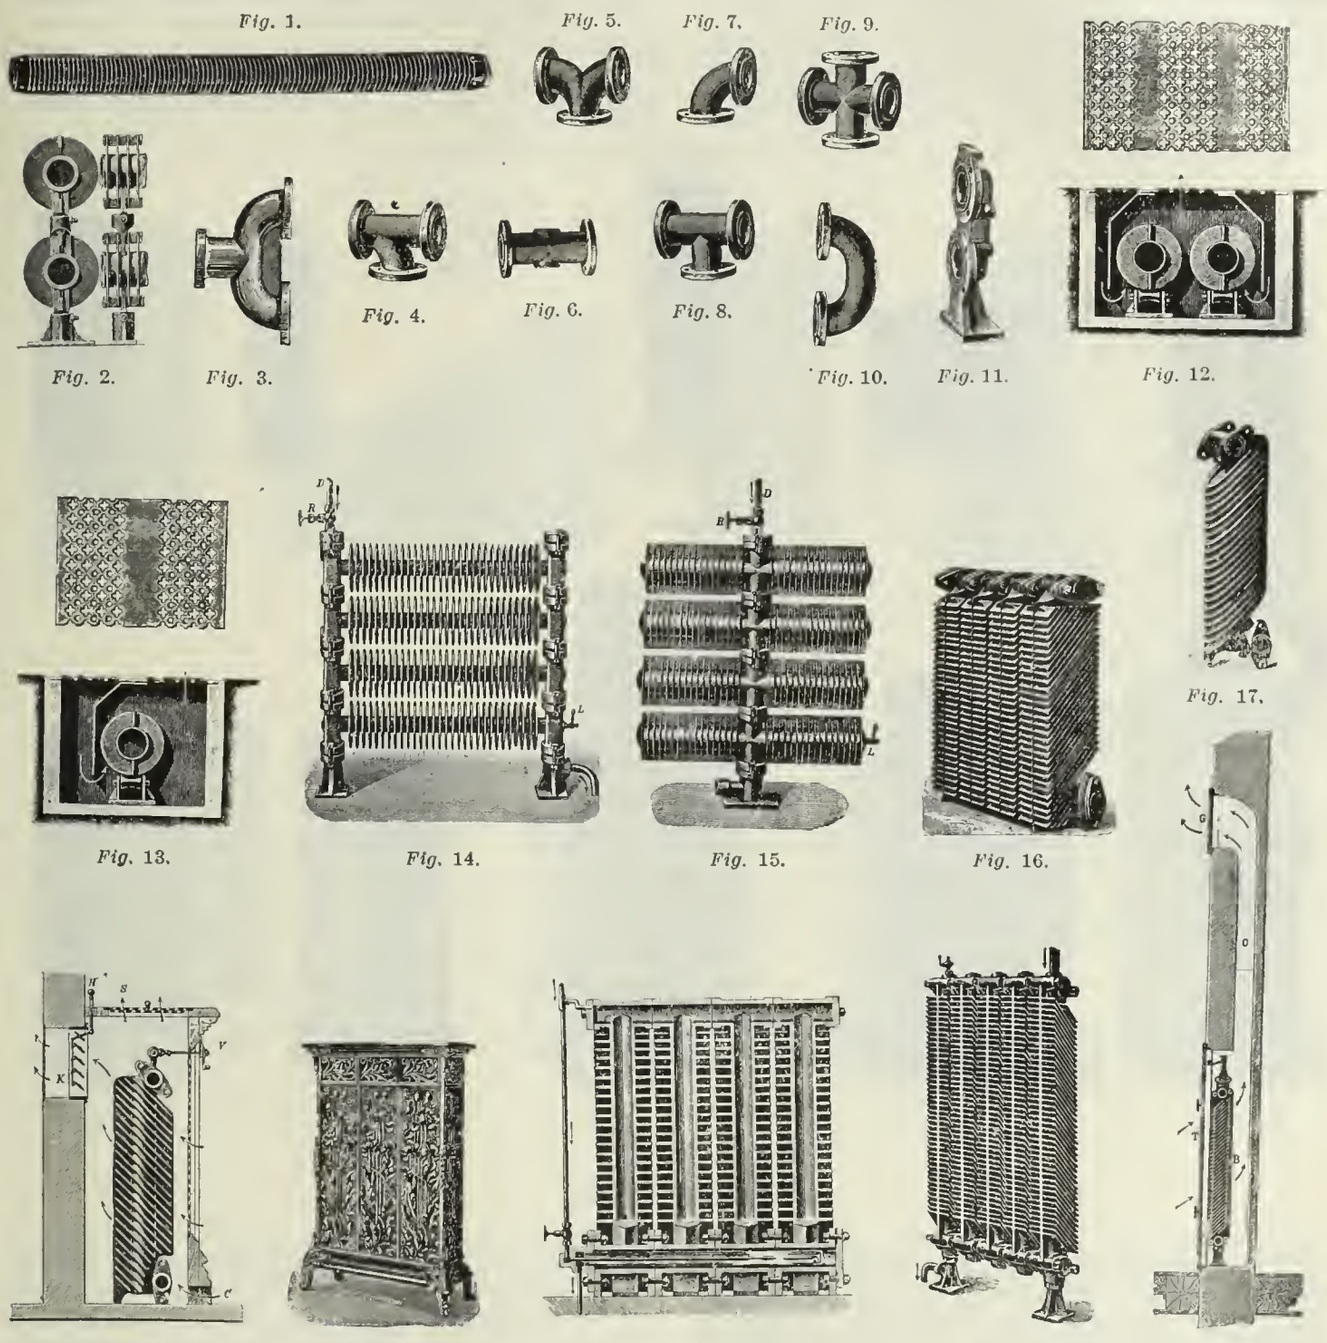
The Metal Worker acknowledges the receipt of a copy of the "Proceedings" of the fourth annual convention of the northern and southern jurisdictions of the California Master Plumbers' Association, and of the convention consolidating the two jurisdictions into the California State Association of Master Plumbers. The "Proceedings" not only gives an account of the convention, but also contains the constitution and by-laws, the rules and the Cleveland Resolutions. It also contains a report of the State executive conference, which indorsed the action of the National Executive Committee in regard to the repeal of the New York Conference Resolutions and the substitution of the Cleveland Resolutions.

European Radiators.

BY CHARLES F. HAUSS.

The manufacture of radiators in Europe—that is, what the heating trade of America term radiators—is practically a new industry, and one that has made wonderfully rapid strides in the past three years. Some of the plants in Germany, Austria and Russia, as well as some in England, have American machinery and tools, and the later productions compare favorably with radiators made in America, the greatest difference being in weight.

The style of radiation most made and used in Europe is shown in Fig. 1. It is made in lengths of 6 feet 6 inches usually, but is also furnished in any shorter or longer special length desired. The number of flanges, or gills, on this gill pipe vary so that on two sections, each 6 feet 6 inches long and 2½ inches inside diameter, the one has 68 gills 6½ inches in diameter and contains 28 square feet of surface, while the other has 95 gills 7½ inches in diameter and has 54 square feet of surface. With the fitting shown in Figs. 2 to 11 any style or size of radiator can be made up. For residences they are covered with wood or ornamental iron casings. Figs. 12 and 13 show the gill pipe radiator used in channel heating for church aisles, where the radiating surface is placed under the floors.



In Figs. 14 and 15 are presented other styles of extended surface radiation, made in various lengths, while Figs. 16 and 17 show a box radiator, with square or oval gills, set at an angle, Fig. 18 illustrating how this style of radiator is cased.

Fig. 19 is a radiator made in ornamental slabs, with ribs at the back, giving a large amount of surface. The fronts, being enameled or bronzed, give it a very ornamental appearance. Any number of these slabs can be set together.

Fig. 20 gives a steam-hot water radiator, one that is filled with water which is heated by steam in a welded end tube in the base. Fig. 21 is a narrow recess radiator, used as shown in Fig. 22.

Figs. 23 and 24 represent a box radiator connected horizontally, and in Fig. 25 is shown one connected vertically. In Figs. 26 to 29 is shown what is known as the Star radiator, and Figs. 30 and 31 are illustrations of a very large circular radiator.

A pipe radiator, shown in Fig. 32, is made of wrought iron tubes expanded into cast iron bases and tops. This style of radiator is made mostly with an inner and outer tube, the air passing through the inner tube and the

EUROPEAN RADIATORS.

water or steam circulating between the two tubes. This type of radiator is made in many forms and sizes, square and round, long and short, and is used principally for schoolhouse heating.

Figs. 33 to 40 show the first efforts made in casting radiators on what was termed the American system, and Figs. 41 to 46 the later efforts in the same field. These radiators are really well made, are nearly as light as American radiators, and are connected with either slip nipple or screw nipple joints, as desired. They are made in all the usual hights, both plain and ornamental. In most cases the sections are set 3 to 3¼ inches, center to center, to facilitate cleaning them.

A novelty for which big claims are made is shown in Fig. 47. It is a tile radiator made in Zurich, Switzerland, and is used for steam and hot water heating. The

The P. and S. S. League.

To correctly award the prizes in the bowling tournament of the Plumbing and Steam Supply League of New York City no little figuring was necessary on the part of Secretary Wilson, and the names of the winners in some instances were not obtainable when our report was given in *The Metal Worker* of March 1. The report, however, was substantially correct. C. W. Grimshaw of the Crane Company team made an average of 174 and won the first average prize, but elected to take instead the gold mounted pearl opera glasses presented by W. S. Emery for the smallest percentage of breaks, having made but 2.38 breaks per game in 14 games. This changed the list of winners of individual prizes and gives first place to J. S. Dibley of the Central Foun-

EUROPEAN RADIATORS.

universal popularity of the old tile stove in Europe, owing to the mild, even heat it gives off, and the objection to steam heat on the score of its intensity, and the fact that under the best conditions it is intermittent, prompted the inventor to take a pipe radiator and cover it with tile. A steam radiator of this type gives off the heat much like a hot water radiator. It is slower in getting warm, never is so intensely hot as to burn the dust and give off the consequent bad odor, and when shut off it gives off the stored heat gradually; hence it is good for spring and fall heating, when the radiator can be heated and then shut off to cool slowly, the same as a hot water radiator, without running the risk, ever present in hot water heating, of freezing or flooding. For hospitals or schools its smooth outer surface commends it for sanitary reasons, and where an ornamental radiator is wanted it admits of the most elaborate decoration. Its cost is said to be about the same as that of cast iron radiation.

A MEETING of the Central Board of the National Association of Master Plumbers of England was held at Nottingham on February 28.

dry Company team, with an average of 171 11-14; the second place to Rollin C. Wilson of the Salesmen team, with an average of 171 10-13, and the third place to A. E. Good of the Crane Company team, with an average of 164 1-14. It will be seen that the difference in average between Mr. Dibley and Mr. Wilson is but a very small fraction of a pin, or 1-384. E. E. Haff made 67 spares in 14 games and secured the prize for the greatest number of spares. The diamond cuff buttons, donated by the *Plumber and Fitter* for the greatest improvement, were won by R. J. Pearson of the C. S. Locke & Smith team, he having made an average of 118 in his first seven games and 151 3-7 in the last seven games, showing an improvement in the average of 33 3-7 pins.

Arrangements have now been completed for a dinner to be given at the Drug Trade Club, 100 William street, on Saturday, March 22, at 6.30 p.m., when the prizes will be awarded to the different winners by prominent members of the trade. Tickets for the dinner will not be restricted to members of the teams, as the desire is to make it a social event in the trade. Any one connected with the plumbing and steam supply trade can procure a ticket for $1 from Secretary Rollin C. Wilson, 116 Nassau

street, New York, if sufficient notice is given to enable arrangements to be made for proper service.

Captain Emery had his best team out in the Business Championship Tournament last night. C. G. Beach of the Central Foundry Company team has been elected captain to select the team to bowl a series of friendly games with the team composed of members of the plumbing supply trade in Boston, Mass., three games to be bowled in Boston and three in New York. Mr. Beach is now in correspondence with Oscar Saxe of the Dalton-Ingersoll Company of Boston, and as soon as his arrangements are completed announcement will be made of the dates on which these contests will take place.

Death of A. T. Henderson.

The heating trade will learn with regret of the death of A. T. Henderson, which occurred on Friday, March 7, at his home in Reading, Pa., after a brief illness from Bright's disease, attended with much suffering. Mr. Henderson was born in Collingwood, Ontario, 43 years ago. During his early life he was connected with a number of manufacturing supply houses in Windsor, Canada, and Detroit, Mich. In 1887 he was made the manager of the Detroit Heating & Lighting Company, which office he left in 1892 to take an active part in the United States Heater Company. On the organization of the Prizer-Painter Stove & Heater Company of Reading, Pa., in 1899 he became a director of that company, of which he was the secretary at the time of his death. Mr. Henderson was not only well acquainted with the trade in Detroit, but had traveled a great deal and had spent several years in Chicago, and later in New York. He thus had an opportunity of establishing friendships in these different centers of the heating trade, in which he was held in high esteem. His knowledge of the business enabled him to design a number of steam and hot water heating boilers, which are still upon the market, reflecting credit on his ability and judgment. His funeral took place on Tuesday and was attended by many friends. He is survived by a wife and one daughter.

Deming Pumps.

The Deming Pump Company, Salem, Ohio, are now issuing to the trade their 1902 catalogue, No. 21, devoted to pumps and hydraulic machinery. It consists of 294 pages, bound in flexible cloth cover. The introduction calls attention to the quality and design of the Deming pumps, also to the company's telegraphic code, classification of pumps, alphabetical index and rules and tables for use of pump men and hydraulic engineers. It also states that for the convenience of dealers and users they print a special catalogue devoted to Triplex deep well and power pumps, and one relating to spray pumps and nozzles. The first section of Catalogue 21 is devoted to ordinary lift and pitcher pumps, followed by antifreezing pumps and pumps adapted to operation by means of a hand lever or wind mill power. These are followed by a variety of force and lift pumps of both single and double action type. The next section refers to the company's specialties, such as stuffing box heads, deep well working heads, cylinders, working barrels, artesian well valves and cylinders. Strainers, foot valves, tank and float valves, air chambers, pump leathers, wind mill connecting rods and regulators and drive well points occupy another section of the book. These are followed by a variety of double acting lift and force pumps adapted for various purposes. Power pumps, hand boiler feed pumps, steam pumps and pumps designed to be operated by horse-power are followed by double acting Triplex pumps and pumps for heavy duty, and these by spraying apparatus and the Deming hydraulic ram. The concluding pages present street hydrants, kitchen sinks, a variety of brass goods, tools and supplies, several pages at the end being devoted to the prices of different pump repairs.

EUROPEAN RADIATORS.

NEWPORT, R. I., has adopted a new ordinance requiring the examination and licensing of plumbers, and the formulation, in connection with the Board of Health, of new rules and regulations relating to drainage and plumbing. A penalty is also provided for those who violate the ordinance.

The Morgan Vacuum Steam Heating System.

The excellent results attending the equipment of a large apartment house by Morgan & Co., 40 Dearborn street, Chicago, with the Morgan vacuum system will lend interest to the following description of the building and what was accomplished in it:

The building has a frontage of 50 feet and a depth of about 100 feet. It is five stories high and contains 11 flats, besides the apartments occupied by the owner, which in space are the equivalent of three flats. There are also two flats at the front of the first story, boiler room and laundry occupying the space of one flat in the rear. The building contains 71 radiators and five coils, about 2500 square feet of surface in addition to mains and risers, which are not covered. There is also connected to the heating boiler a 300-gallon tank, from which is furnished hot water for domestic purposes. The heating plant in the building was first fired on December 7, but as it was in an incomplete state some allowance must be made to arrive at a fair comparison as to the relative economy of the apparatus with and without the vacuum system, though relative attention required and duration of heat may be fairly compared.

The Morgan Vacuum Steam Heating System.

The boiler is a multitubular with smoke burning attachment, and as a smoke burner is very successful. The smoke burning attachment consists of coking ovens, one on each side of center grate, grate of ovens having a sharp pitch toward center grate, the fuel after coking being raked over to center grate. The gases from the coking coal pass to back of boiler in brick flues and are returned to front, passing up through center grate, also through incandescent coals thereuon, and are practically consumed, there being very little, if any, smoke showing at top of chimney. The fuel used is Illinois soft coal, run of mine grade.

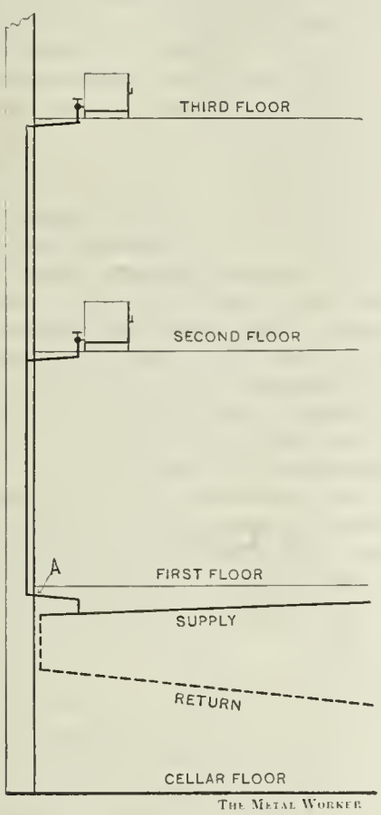
Before attachment of the Morgan vacuum system it was necessary to fire the boiler every two hours, from 5.30 a.m. until 9.30 p.m., heat being maintained not to exceed one-fourth of the time during these hours and not at all at night. Under these conditions there was consumed during the month from December 7 to January 7 34 tons of coal. The Morgan vacuum system was attached on January 9, and, though not entirely completed, was immediately successful in maintaining constant heat both day and night, the consumption of fuel for the ensuing month until February 9 being 27 tons. The fuel consumption from February 9 shows a very marked decrease, though the exact amount cannot be determined before the entire carload of coal has been used, as all weights mentioned were taken from the bills of the coal dealer.

It has proved to the satisfaction of the owner that with the Morgan vacuum steam heating system the amount of fuel used is governed by the external temperature and, further, that the attention required is correspondingly reduced, as in this plant, in the most severe weather, it was only necessary to fire five times a day in addition to raking the coke to the center grate twice, whereas before the vacuum system was attached nine times was the minimum, though it is probable that with the ordinary steam boiler using hard coal firing once in 24 hours would be sufficient.

In this heating plant, with the exception of one cluster of four radiators, each radiator has a separate air pipe extending to the basement, where it is attached to the main air pipe, which is 1-inch, running side by side with the main. The 1-inch pipe starts at the end of the return pipe, which is connected to the main air pipe through a mercury trap, this being the high end of the air pipe, which from this point pitches to the boiler. At the boiler the air and water of condensation are separated by a loop, the air passing up and over the loop and then down to the main mercury trap, the water passing to the boiler through the return, as shown in the cut herewith. In this manner all escape of water or steam into boiler room is entirely overcome. The damper regulator is attached to return pipe below water line, so that circulation takes place through coil in tank, in this way governing the action of the regulator by the temperature of the water in the boiler.

In practice it has been found unnecessary to run a separate air line from each radiator with the Morgan, but as many radiators can be connected to one pipe as is convenient. It has also been found, the company state, that while an absolutely tight job will give the best results, a job that has many perceptible leaks will be greatly benefited by the vacuum system. A steam plant as tight as a hot water plant will yield, with the vacuum system, the same temperatures and with very much less fuel than the hot water plant, the expense of construction being materially less.

A B C Steel Plate Fans.



The American Blower Company, Detroit, Mich., with New York office at 141 Broadway, are sending out their illustrated sectional catalogue No. 134, devoted to the A B C steel plate fans for heating, ventilating and drying plants, forced and induced draft apparatus. The introduction calls attention to the increasing popularity of the fan system of heating and to the success of the company in keeping abreast of the demands of the trade in producing fans adapted to their requirements. The catalogue shows a great variety of fans of all sizes, full and three-quarter housed, adapted for cooling a large quantity of air; some with engines directly attached and some to be electrically driven. Views are also given of the fans removed from their business, so that the general construction may be readily understood. Engravings also show the construction of the journal boxes. The catalogue contains a large number of tables giving the dimensions of the fans, and also their capacities, besides a variety of useful information on fan work. The last portion of the catalogue is devoted to exhaust fans and the A B C hot blast apparatus complete with fan, heater and main delivery duct, such as is used in modern buildings for heating and drying material. The catalogue is accompanied with a circular relating to the Morehead return trap, which is especially designed for use in connection with heaters of hot blast systems.

The Metal Worker acknowledges the receipt from Secretary A. P. Elder of a copy of the "Proceedings" of the seventh annual meeting of the Kansas Master Plumbers' Association, held at Topeka, Kan., on January 20. In addition to the report of the convention the pamphlet contains two interesting papers, one on "Sewers and Their Construction," by W. R. Goit of the W. S. Dickey Clay Mfg. Company, and the other on "Business Methods of the Plumber," by I. Bishop. These papers are followed by a list of the members of the association.

COLD WALL STOPS STEAM CIRCULATION.

BY ACE.

That the results obtained at radiators are very often attributed to conditions for which they are in no way responsible was demonstrated when testing a heating apparatus during a recent cold spell. After starting a fire for the first time in a one-pipe steam job in a new building, circulation was established in all but the two radiators shown in the sketch herewith. The supply to these radiators is taken from the top of the main, as shown, the riser being concealed in an exposed brick wall, running parallel with and touching a terra cotta smoke flue, which is open top and bottom, but not in use. With 3 pounds pressure at the boiler the two radiators would not circulate, although the supply branch in the cellar was hot at A, where it entered the wall. The automatic air valve was disconnected at the second-floor radiator and examined, and there was no indication of steam or water at the vent opening in the radiator; the radiator was disconnected at the valve and the valve

Cold Wall Stops Steam Circulation.

examined with the same results. This located the trouble between the point A and the second-floor radiator, the natural conclusion being that the riser was stopped up, for during these examinations 3 pounds pressure was maintained at the boiler. After reducing the pressure to zero the elbow at the top of the main in the cellar was broken, the branch from the riser to the second-floor radiator was taken out and pieces of putty about 1 inch in diameter were dropped through the riser from the second floor to the cellar, which proved that the riser was clear. Theories were resorted to, but, with all due respect to theories, none seemed to explain why the radiator did not circulate, and the following experiments were made, which located the cause and corrected the trouble.

All the connections were replaced, and with 6 pounds pressure at the boiler water was discharged at the air valve of the second-floor radiator, which proved that although the pipes were clear and the valve open the condensation between A and the second-floor radiator was so great that the steam delivered to the riser was condensed and held in suspension. A drip pipe between the bottom of the riser and the return main was suggested but not used, as the object was to reduce the excessive condensation and not provide for it. This was accomplished by resting the bottom of the riser on a block of wood in place of the stone wall and placing strips of wood between the riser and the wall at every point where they came in contact with each other. The bottom of the idle smoke flue was closed to stop the cold draft, but as this flue will be used for the kitchen range it was not thought advisable to place wood between it and the steam risers. When this flue is in use it will assist in warming the wall and reducing condensation in the riser.

Many readers may be of the opinion that the excessive condensation in the riser was due to other conditions than those stated, but no other changes or additions were made and the two radiators are now circulating with no indicated pressure at the boiler, which fact I believe to be the proof of the pudding. While it is generally understood that it is not good practice to allow heat conductors to come in contact with conducting materials of a lower temperature, the great detriment to the success of the apparatus is seldom fully appreciated until after an experience, which is often very costly and troublesome. When compelled to place heat risers in exposed walls it is good practice to line the recess with wood or asbestos cardboard.

New York City Notes.

The Examining Board of Plumbers has about the same number of applicants each month, the average being about 25 from all boroughs.

* * *

C. D. McClure of 144th street, Bronx, has the plumbing of a large apartment house at Broadway and 111th street.

* * *

The Tracy Plumbing Company are busy with plumbing the club house and buildings of the new Jamaica race track, and will shortly start the plumbing in the subway station at Fifty-ninth street and Broadway.

* * *

Samuel Lyttle of West 118th street has two good jobs well under way in a large eight-story apartment, 75 x 100 feet, at the corner of Madison avenue and Ninety-ninth street, and eight seven-story apartments on Ninety-first street between Lexington and Third avenues.

* * *

Henry Steinert, who has been counsel to the Board of Health for many years, lately resigned at the instance of the Corporation Counsel, who stated that as much of the legal work of the Board of Health would be transferred to the Tenement House Board, his services were not needed. By the resignation of Mr. Steinert the plumbers have lost a good friend, one who was always ready to take action against a nuisance or help a deserving plumber out of a difficulty.

* * *

The Tenement House Law has been amended as regards Brooklyn, allowing three-story tenements to be put up there without all the restrictions imposed in Manhattan. There is no doubt that this will encourage building in Brooklyn at the expense of Manhattan, although the class of houses that are likely to be put up are such as Manhattan can afford to dispense with.

* * *

The rival central bodies of the building trades have finally come together under the name of the United Board of Building Trades of New York and Vicinity. The first thing they did on uniting was to order all rival trades unions to cease fighting. This includes the plumbers, which trade will decide on March 16 as to what form they will be governed under.

THE new price-list of the Richmond Heaters, manufactured by the Richmond Stove Company, Norwich, Conn., which took effect February 18, 1902, will be a convenience to all who contract for steam and hot water heating systems. It gives, in addition to prices, many useful dimensions of the company's vertical sectional and round Steam and Hot Water Heaters, also small Tank Heaters and Laundry Water Heaters.

ASSOCIATION NEWS.

New York State Plumbers.

The fourteenth annual convention of the New York State Association of Master Plumbers was held at Elmira, N. Y., on Tuesday and Wednesday, March 11 and 12, with a large attendance. After considerable discussion the Cleveland Resolutions were indorsed. The old officers were re-elected, as follows:

President, Charles B. Huck, Buffalo.
Vice-President, B. F. Donahoe, New York.
Secretary, H. J. Wood, Buffalo.
Treasurer, A. H. Brown, New York.
Executive Committee: Horace F. Westcott, Albany, and the officers.

A banquet was given the visiting delegates by the Elmira Association under the management of a committee composed of Robert H. Walker, John T. Sadler and George W. Krowl.

Jersey City Master Plumbers.

A meeting of the Master Plumbers' Association of Jersey City, N. J., was held at Groeschel's Hall on Thursday evening, March 6, with a large attendance of members, when the following officers were elected for the ensuing year:

President, A. Becker.
First Vice-President, J. A. Joans.
Second Vice-President, W. H. Stone.
Third Vice-President, C. Sulk.
Recording and Financial Secretary, M. P. Moran.
Treasurer, W. J. Cross.
Sergeant-at-Arms, T. Heatherton.
Trustees: T. Heatherton, J. A. Joans, C. Sulk.
Committee on Licenses: T. Heatherton, J. A. Joans, J. Sprouls, A. Werner, G. Knoll.

A Trip Through a Sewer.

A very remarkable experience came to Edward Boyle, a plumber's helper in the employ of George Bradischer of 2 Goerck street, New York City, on Thursday. He was working at the removal of a stoppage in a house drain from the main sewer on East Fifty-third street, when a heavy shower in another section sent a rush of water through the sewer, which is said to have a pitch of 30 degrees at this point. Two men who were working with Boyle came out of the sewer, but he went back to strengthen the staging from which they had been working with a life line attached to him. The latter broke and the life line became detached and Boyle was swept swiftly along the murky stream, but not without friction in turning corners, according to his story, until, with germs, microbes and other miscellaneous refuse, he was shot from a maelstrom of darkness into a Niagara Falls of light in the East River. He was taken on the barge "Fleming" by Capt. Otto Lauritzen, who turned him over to an ambulance sent by the police to the mouth of the sewer at Forty-ninth street. Boyle suffered no material damage, and after a bath and a change rode back to the shop in his employer's wagon. He says he had to swim for it, and received from the patrons of the sewer many stale bouquets and similar doubtful compliments *en route*, so that he has no desire to repeat the trip.

The Oberle Pipe Support Fittings.

Some new fittings that will be interesting alike to plumbers and steam fitters who have to provide support for heavy drain and steam mains have been put on the market by J. F. Oberle, 780 Second avenue, New York City. They consist of a substantial cast iron base drilled and tapped for wrought iron pipe of suitable size for supporting a heavy weight. It has a broad, square bottom, and the pipe socket is reinforced. The rest for the upper end of the pipe standard is made for different uses. One is adapted to the use of cast iron soil pipe, and has the regulation ¼-inch pitch, so that a soil pipe that runs above a cellar bottom can be firmly supported and the wrought iron standards cut so as to suit the fitting and preserve the pitch. Another style of rest is adapted to the large horizontal hot water storage tanks used for supplying apartment houses with hot water. These rests fit the curve of the tank, support it securely and save labor and expense for the plumber. Another style of rest is adapted for supporting vertical tanks, having a curve to fit the shell of the tank at the bottom. These will be found a great convenience. Circulars giving full explanation and showing the fittings and all their applications will be sent to those who desire them.

Heating and Plumbing Notes.

We have received from President E. D. Hornbrook of the National Association of Master Plumbers, a copy of the official directory of recognized master plumbers in localities where there are members of the National Association of Master Plumbers, issued under date of March 1. The directory consists of 170 pages and, in addition to giving a list of members, also includes the names of many who are not members of the association, these latter being designated by means of an asterisk.

B. J. Lambert, city clerk of Merrill, Wis., will receive bids until March 20 for heating, ventilating, plumbing and sewerage systems for the new High School Building at that place.

Inferior plumbing is alleged by the City Plumbing Inspection Department of Denver, Col., to be increasing throughout the city. Ordinances prescribe certain conditions within which all plumbing must come. The inspectors have reported that much inferior work has been condemned within the last month, causing considerable extra expense to the citizens who had paid for the work, supposing it to be first class. The department chiefs say that all competent plumbers have certificates from the city plumbing examiners and that these should be demanded by master plumbers.

The Metal Worker acknowledges the receipt of an invitation from President E. E. Hoff of the Plumbing and Steam Supply League not only to attend the first annual dinner of the League, but also to present one of the prizes to the winners. The dinner, which is to be given at the Drug Trade Club, 100 William street, New York, on March 22, at 6.30 p. m., will be quite a social event in the trade.

Tucker & Co. of Boston, Mass., have opened a branch of their plumbing business on Front street, in Marblehead, under the management of Robert J. Cleary.

The new Cast Iron Pipe foundry at Gadsden, Ala., which was started upon the removal from that town of the plant of the Central Foundry Company, is progressing toward completion and will be in operation before the end of this month.

Father Broens, pastor of St. Ignatius' parish, Toledo, Ohio, has awarded the heating of the new church to F. J. Wilhelm of that city. The heating of the parish house has been awarded to the Toledo Heating & Plumbing Company. The wiring of the church and residence goes to the Fisher Electrical Company and the plumbing contract has been awarded to Schelling & Forrest.

James A. McCabe, who has carried on a plumbing business at Ware, Mass., for a number of years, has closed his shop and taken a position as foreman in a shop at Marlboro.

James C. Smith, chairman of the School Board of Meadville, Pa., will receive bids until March 22 for a system of plumbing for the Second District School in that town.

The N. O. Nelson Mfg. Company of St. Louis, Mo., are said to be contemplating the opening of a branch house in Des Moines, Iowa.

Blum & Eyster, 30 North Beaver street, York, Pa., have the contract for the plumbing, cornice, sheet iron and tin work on the York Opera House.

William L. Quinnell died at his home, 131 Bowdoin street, Springfield, Mass., on March 7, aged 65 years. He was prominently identified with the manufacture of Tiles, Mantels and Gas Fixtures. He is survived by his widow and one daughter.

The master plumbers of Brockton, Mass., are organizing an association for the purpose of conserving the interests of employing plumbers in Brockton.

A meeting of the Acetylene Association of England was held at the Westminster Palace Hotel, London, on February 27, for the purpose of perfecting the association and establishing it on a more permanent basis.

William T. Disley, Waterbury, Conn., has secured a large contract for plumbing in connection with the factory of the Farrell Foundry & Machine Company, in which he will use the fixtures made by the J. L. Mott Iron Works of New York City.

The Fairy Hose Nozzle, printed full size in bronze on a circular that is being sent out by Landers, Frary & Clark, 82 Chambers street, New York, gives a lifelike impression of a seasonable device which throws either a small stream or a spray controlled by means of a turnkey.

Thomas Kelly & Bros., Chicago, are sending to the trade a large mailing card showing a sectional view of the Kelly Siphon Jet Wash Basin, 500 of which have been used in the new Frick Building in Pittsburgh, Pa.

Pittsburgh, Pa., is to erect a $10,000 natatorium at the East End, to have a swimming pool 50 x 90 feet.

A bill is before the Legislature of Virginia to provide for a State board of examiners, who shall pass on the qualifications of plumbers applying for license, and to have plumbing inspectors as State officials.

It is stated that the loss to the Borough of Brooklyn, N. Y., through lax administration in the Water Department has extended over several years and will amount to some millions of dollars. While defective water meters are pointed out as one of the causes, the favoring of some classes of customers and the continuing in use of water meters known to be unfit for service is responsible for a far greater part of the loss. It is useless to blame unconscious mechanical devices for the conscienceless behavior of disloyal officials.

J. D. James, Storm Lake, Iowa, has added a heating and plumbing branch to his Hardware establishment, at Storm Lake, Iowa. He is overhauling the heating plant at the Park Hotel and equipping it with a fine system of plumbing. He is also heating and plumbing the new Roman Catholic parsonage, and the new home of the Rev. D. Williams. Mr. James has a number of other large jobs on hand, among which is the heating of the Universalist Church at Alta.

The County Commissioners of Nashua, N. H., are about ready to receive bids for plumbing and heating the new Court House to be erected during the coming summer.

A fire recently destroyed the plumbing shops of D. Parrett and S. C. Blake, at Marshalltown, Mich.

Attorney Charles R. Clapp, Toledo, Ohio, says the *News*, has two Coldwater, Mich., clients who are figuring on establishing a manufactory in that city for turning out Brass Goods and Bathtubs. The manufacturers were in the city on March 7, and looked over the manufacturing district. They want about 2 acres of ground, and their plant would employ 40 to 50 people, all told. They want a site on or near the belt railroad.

The Royal Heating Company, 210 Mason street, San Francisco, Cal., have recently installed the following plants: One in a large apartment house belonging to C. E. Knickerbocker, heating 35 apartments; a battery of boilers in the Claus Spreckels Building, and the Oceanic Steamship Company's offices; a steam heater in the parochial house of Rev. Father Peter S. Casey, and a steam heating plant in the residence of Samuel G. Murphy; also hot air plants in the San Francisco City Library and the Hotel Majestic. This latter job has just been successfully tested. It is a twin furnace plant with two large hot air pipes to heat 30 rooms. These rooms are heated equally as far as can be detected without the use of a thermometer.

George Callahan & Co., 218 Front street, New York City, are distributing a large sized blotting sheet bearing on one side the advertisement of their Old Reliable Pipe Joint Cement. This Cement is claimed to stand 500 pounds pressure on 18-inch flanged joints, and is said to prevent all leaks in steam, water, gas and oil pipes, and screw or flanged joints. It is also recommended for use on leaking tanks, and can be used with rubber or copper gaskets, or spread on canvas or other fabrics. The cement has established an enviable reputation during the 15 years in which it has been on the market.

New Firms and Changes.

Thomas Kelly & Brothers, Chicago, Ill., have been incorporated by W. R. Davies, L. Heislar and A. D. Bacci, with a capital of $75,000, to deal in and manufacture Plumbing Goods.

Lawrence Kling succeeds to the plumbing and heating business of Kling & Ballou, at 192 State street, New Haven, Conn. G. F. Ballou has withdrawn from the firm and will go to Jacksonville, Fla., where he will engage in business.

The Automatic Heat Regulator Company of Elkhart, Ind., have been incorporated with a capital of $10,000 by D. N. Lieb, H. C. Fidler, B. D. Hoseworth, C. E. Clark, J. P. Heasley, J. L. Harmon and J. C. Eberhart, Jr.

Simmons H. Isler, Jr., Kinston, N. C., informs us that he will open a plumbing, roofing and heating shop in that city on March 15, and would be glad to receive catalogues and price quotations from dealers in Plumbing, Roofing, Hot Air, Steam and Hot Water Heating Goods. He will also do lightning rod work, and will buy Old Metals and Rags.

F. A. Hancock of Morris, Minn., and E. C. Barnes of New York have started a plumbing and heating business, at Morris, Minn., under the style of Hancock & Barnes. They have already secured several large contracts and expect a good year's business. Catalogues from the trade would be acceptable.

William Bray's interest in the plumbing business of the firm of Treher & Bray, at Gloversville, N. Y., has been purchased by A. Treher, who will conduct the establishment in the future.

Joseph Fletcher has sold his plumbing business, at Summit, N. J., to M. Chrystal, and will hereafter be found in his employ.

The New York Centrifugal Trap Company of New York City have been incorporated with a capital of $100,000. The directors are F. T. Dwyer of Detroit and J. W. Brown and W. A. Bourne of New York.

The Purities Closet Ventilation Company of New York City have been incorporated with a capital of $100,000.

TRADE NOTES.

The Grasselli Chemical Company, Cleveland, Ohio, favor us with a copy of the artistic pamphlet which they are distributing in the interests of the various Chemicals of their manufacture. The publication is of a highly artistic character and contains a history of the business of the Grasselli Chemical Company, which has been conducted for the past 70 years. The company at present operate plants at Tremley, N. J.; North Tonawanda, N. Y.; Titusville, Boughton and Beaver Falls, Pa.; Cleveland, Ohio; East Chicago, Ind., and Birmingham, Ala. They also have branch offices and distributing stations in New York City, Milwaukee, St. Paul, St. Louis, New Orleans and Cincinnati, with other agencies in this and foreign countries. Among the leading lines of Chemicals manufactured by the company are Sulphuric Acid, Hydrochloric or Muriatic Acid, used largely for sheet iron and in galvanizing; Glaubers' Salt, Nitric Acid, Zinc Sulphate and Chloride, Glycerin, Blue Vitriol, Acetic Acid, Soldering Fluxes, &c. They are among the largest manufacturers of these materials.

In another column of this issue E. Bissell & Co., 12 Murray street, New York City, announce an important auction sale of Enameled Ware, to be held at their auction room on March 20 and 21. The sale, which is by order of the Lalance & Grosjean Mfg. Company and the National Enameling & Stamping Company, includes over 10,000 cases of Opal, Blue and White, Venetian, White and White, and Gray Enameled Ware. As all seconds of Enameled Ware are to be sold at auction and in no other way, this sale is of importance to the trade.

Pattern for Round Fork.

A correspondent at Tinsonburg, Ontario, writes: I note an inquiry was made in *The Metal Worker* of October 19, 1901, for a round crutch or Y, and inclose herewith my method of obtaining the pattern for same. I am a beginner in pattern drafting, and have studied the principles of this problem by my own thought, and if it is good enough to be published in your paper it would encourage me very much.

In Fig. 1 is shown the elevation of a 16-inch pipe, branching into two 8-inch pipes, running in opposite directions at an angle of 45 degrees. In Fig. 2, A C D E B is a reproduction of similar figures in Fig. 1. In Fig. 2 place the half profile X Y Z, using F as center. Divide in 10 or any equal number of parts, and draw parallel lines from each point to intersect line C D at right angles to C D. Then from each point on C D drop vertical lines indefinitely below the base line, as shown. This gives the projections from line C D of each space of the 8-inch pipe. Then from each intersecting point on C D draw horizontal lines to the right, at right angles to the vertical lines; this gives the hight of each space of the 8-inch pipe from base line. Now scribe one-quarter circle, S T, with R as center and A B as radius. Divide the same into one-half the number of spaces shown in the semicircle X Y Z. From each point draw horizontal lines any distance to the right; this gives the hight of each space on miter line, A B. Next scribe the semicircle I J K with H as center and B E as radius. Space the semicircle I J K into ten equal parts, and draw horizontal lines from each point until they intersect the line I K. Each of these lines gives the projections. Next scribe the semicircle L M N with O as center similar to X Y Z. Space the semicircle L M N into ten equal spaces. Draw horizontal lines from each point to the left until they intersect similar vertical lines drawn from C D, as shown, thus forming the horizontal section or oval space on C D. Now take the distance from 1′ to 1 in plan and place it, as shown, from P to 1′ in the diagram of triangles. Lift point from P to first elevation line, 1, of 8-inch pipe, and draw a line from 1 to 1′.

This gives the triangle 1′ P 1 on the line 1′ 1 in plan. Now take the distance from 1′ to 2 in plan and place it from Q on the base line to 1′. Raise point from Q to second elevation line, 2, of 8-inch pipe, and draw a line from 2 to 1′. Take the distance from 2′ to 2 in plan and proceed in the same manner as before until the point 6′ to 7 in plan is reached. Next take distance from 7 to 7′ in plan and place it from U on the line 7 to 7′ in diagram of triangles, and draw a line from 7′ to the elevation line, 7, of the 8-inch pipe. Now take the distance from 7′ to 8 in plan, which place from U¹ to 7′ in diagram of triangles, and draw a line from 7′ to 8 of the 8-inch pipe.

Proceed in this manner until all the triangles have been obtained. The slant line 1′ 1 of the triangle P 1′ 1 gives center line of pattern in Fig. 3 or E D in Fig. 1. The lengths of the slant lines of the triangles in P in Fig. 2 are shown in the pattern in Fig. 3 by heavy lines, while the lengths of the slant lines in Q in Fig. 2 are shown in the pattern in Fig. 3 by dotted lines.

The spaces at the top of the pattern are obtained from the half profile X Y Z in Fig. 2, and the spaces at the bottom of the pattern from K to I in Fig. 3 are obtained from the true section on B E in Fig. 2, while the spaces shown from K to H and I to H in Fig. 3 are obtained from the true section on A B in Fig. 2.

Note.—While our correspondent's drawings and description might have been a little more explicit, we be-

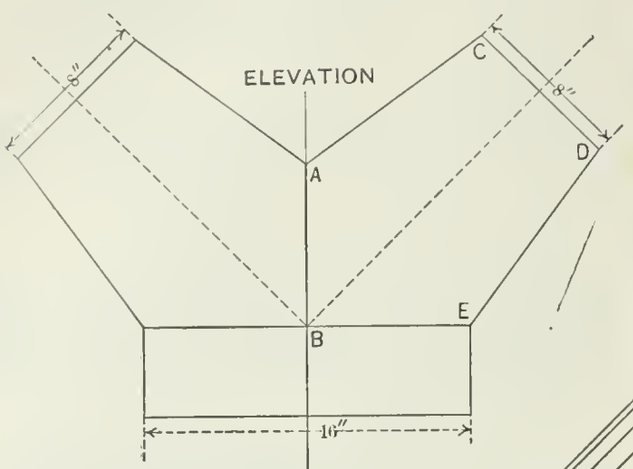


Fig. 1.—Elevation of Pipe.

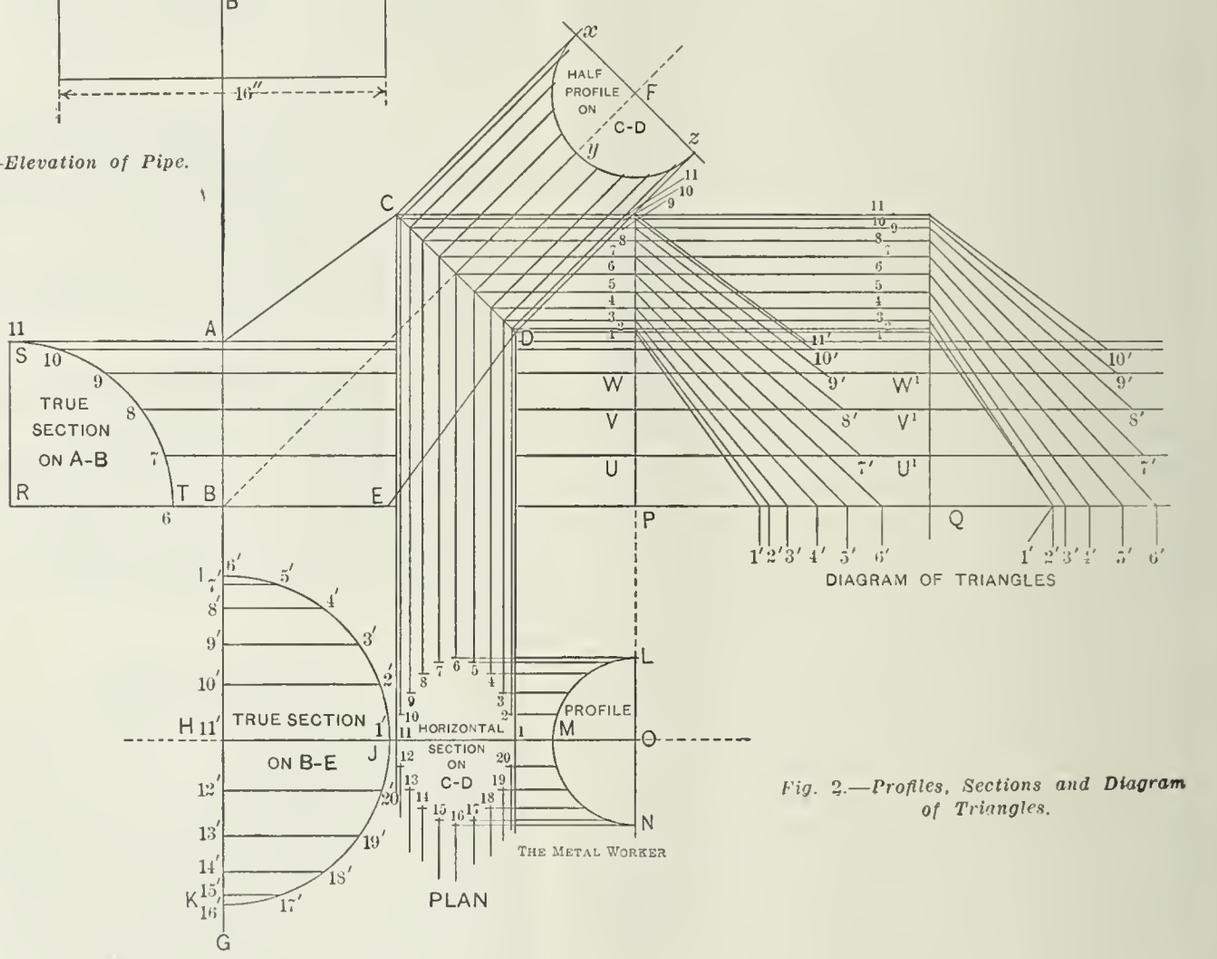

Fig. 2.—Profiles, Sections and Diagram of Triangles.

PATTERN FOR A ROUND FORK.

lieve they will be understood if gone over carefully. However, for our correspondent's information as well as for our readers generally, we would say there is a shorter rule for obtaining the pattern without the use of the plan. All that is required, providing the two arms are symmetrical, is the elevation shown in Fig. 1 and the size of the openings, whether they are round or any other shape. Take a tracing of A C D E B and place it as shown by similar letters in Fig. 4. Then on C D place the semicircle C Y D, on B E the one-quarter plan B E K, and on A B the one-half true section on that line, as A B T. With these profiles in position proceed in a similar manner as explained in connection with the problem entitled "Pattern for a Fork," published on page 54 of *The Metal Worker* for October 5, 1901.

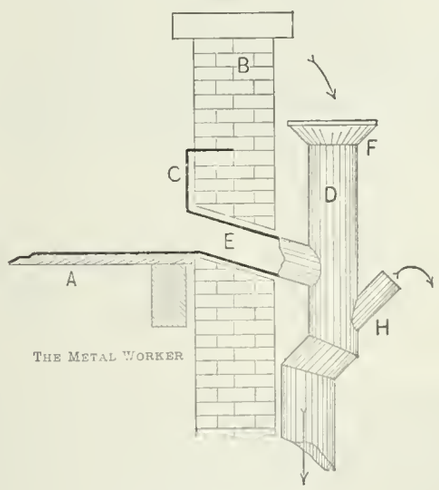
PATTERN FOR A ROUND FORK.

The Tin and Sheet Mill Machinery Agreement.

Negotiations have been on for some time between the sheet and tin plate companies of the United States Steel Corporation and the foundries making sheet and tin mill machinery which were included in the agreements entered into on the formation of the respective companies for the supplanting of the old agreements by new ones, and the negotiations have now reached such a point that a final agreement is likely to be arrived at before the week is out.

The parties to the one agreement are the American Tin Plate Company on the one side and the nine foundries owned by the following concerns: United Engineering & Foundry Company, Mesta Machine Company, A. Garrison Foundry Company, George A. Hogg Iron & Steel Foundry Company, Lewis Foundry & Machine Company, Mackintosh, Hemphill & Co. and the Seaman-Sleeth Company. The latter company make chill and sand rolls exclusively. Mackintosh, Hemphill & Co. do not make rolls, and the United Engineering & Foundry Company own three plants, which were separate when the agreement was entered into. The other agreement is between the American Sheet Steel Company and these same foundries, with four in addition.

In both organizations the foundries are debarred from building outside tin and sheet mills, while the mill companies are required to give all their work to them. The advantage in the agreement to the foundries was in securing a monopoly of the orders of the mill companies at favorable prices, while to the latter there was expected to be an advantage in hindering the building of competing plants.



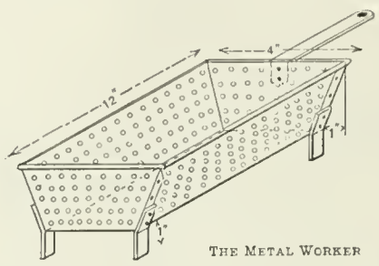
The experience of the past year or two has shown that the agreements have not prevented the building of independent mills, and on the other hand have brought into being a number of independent foundries whose competition has somewhat disturbed conditions. Thus both sides have for some months been desirous of terminating the agreements and the negotiations have been confined to a formulation of the terms. The agreements provided that they could be discontinued at any time prior to the five years for which they were entered into by mutual consent, the foundry side requiring the consent of two-thirds of the foundries.

The terms which are practically agreed upon are that the foundries are to continue to receive all the business of the tin plate and sheet companies, on a lower schedule of prices than formerly, while they are to be at liberty to take contracts also from independent mills. They will thus be given a broader market, while the two mill companies will get their machinery and rolls on very favorable terms.

The effect of the new agreement will be unfavorable to the independent foundries which have been built recently, as no additional business is assured them by the new arrangement, and they will have strong competition for the business of which they have heretofore had a monopoly.—*Tin and Terne.*

THAWING FROZEN LEADERS.

A difficulty often experienced at this time of the year is keeping leaders clear of ice. Where the gutter is connected directly to the leader it is an easy matter to clear



Thawing Frozen Leaders.

the ice in the pipe by means of rock salt and hot water, but where a tube passes through the wall or any other part of a building, and an elbow is the result, it can be accomplished as follows: Referring to the accompanying sketch, let A represent the roof, B the parapet wall and C the flashing connecting with the tube E,

which joins the leader D. The pipe, it will be seen, extends upward, to allow it to be easily reached from over the wall, and has a flaring collar, as shown at F. A small offshoot, H, can advantageously be placed in the position shown. When the leader freezes place rock salt in the tube E and the pipe at F, and if convenient pour hot water into the pipe. Should the ice melt on the roof and the water flow into the tube E when the pipe is not open all the way down, the water can overflow at H and will not back up on the roof nor flow under the flashing C. If this precaution is taken the leader pipes can be kept open all winter.

REPAIRING TIN ROOFS.

This is the time and season of the year when the roofer is called upon to do the necessary repairs to tin roofs, and perhaps a few hints on this subject will not

Repairing Tin Roofs.—Fig. 1.—General View of Paint Burner.

be out of place. Where the roof is in very bad condition, or where a leak must be closed temporarily until the weather is more favorable, the spot or leak should be thoroughly dried and a thick coat of red lead applied, over which a piece of cheese cloth should be spread. Then over this roofing cement can be placed, which will make a temporary tight job.

When repairing the roof a hand blow torch can be used to blister the old paint, and while hot the paint

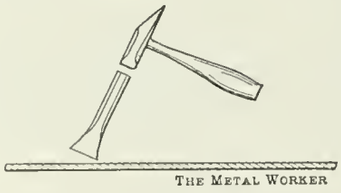


Fig. 2.—Using the Hammer and Chisel.

and dirt can easily be wiped off with an old cloth and a clean, bright surface left, which is readily repaired with solder. When no blow torch is at hand a paint burner can be used. This device is shown in Fig. 1, which readily explains itself. It is made of black sheet iron, with ⅜-inch holes punched in it, as shown. To this are riveted four legs about 1 inch long. The heat is obtained by using charcoal. A few hot coals are first taken from the fire pot and placed in the paint burner, after which the charcoal is broken into pieces about 1 inch in size and placed over the hot coal, the burner being filled with these up to the top. The draft which is created through the perforations soon has the coal in a blaze. The burner is then set over the spot to be repaired. In a few minutes the paint blisters and can be cleaned with an old cloth.

It is sometimes the case that quite a portion of an old roof is to be stripped or taken off. When a hammer and chisel are employed, as shown in Fig. 2, a considerable amount of time and labor are required. A labor saving tool designed for this work is shown in Fig. 3, which is a tin cutter and scraper combined. It can be made by any blacksmith of ¾-inch hexagon steel, about 12 inches long. When cutting the old tin it is used as in diagram A, where the cutter is shown slightly tilted, so that the corner of the knife cuts into the tin roof when struck by the hammer. In this manner a long stretch is cut in a few minutes, as compared with the slow use of the hammer and chisel in Fig. 2. When a scraper is desired for scraping tin roofs then the scraper part of the tool can be used, as shown at B in Fig. 3. Thus the two tools are combined in one, making a useful addition to a workmen's kit.

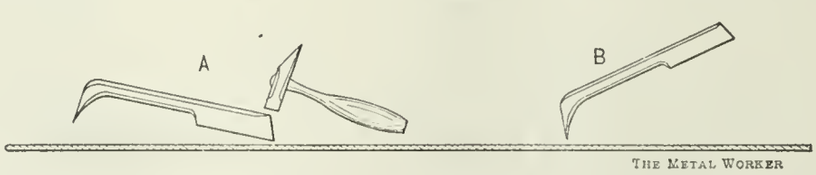

Fig. 3.—The Scraper and Tin Cutter in Use.

Meurer's Felt Roofing.

Meurer Brothers Company, 569 to 577 Flushing avenue, Brooklyn, N. Y., are distributing an attractive circular relating to Meurer's felt roofing, a new line of manufacture which the company have taken up. This roofing is described as being made with a foundation of pure wool felt, thoroughly saturated and rolled out under great pressure. The saturating compounds are said to provide an absolutely water, acid, gas and fume proof substance, making the roofing of value in places where the roofs are subjected to severe tests of acids or gases of any kind. The material contains no tar, consequently it does not become dry and brittle under the action of the weather. It is also claimed to be equally free from danger of cracking in winter or running in summer, and being of a noncombustible nature, is not apt to ignite from burning sparks falling upon it. The roofing is described as light in weight and as being adapted for laying on either flat or steep surfaces. It is made in four different thicknesses, suitable for all kinds of buildings, and is packed in rolls 72 feet long and 3 feet wide, containing two squares (200 square feet) each. It is also recommended for flooring, being extremely durable and capable of wearing for a long time under severe conditions. The half-ply can be used as a sheathing paper and for insulating purposes.

Attention is also called to Meurer's roof paint, which is especially recommended for coating Meurer's felt roofing. This paint is said to dry quickly with a deep black color, to remain perfectly elastic and to be capable of withstanding the action of acids, alkalis and gases to a remarkable degree. It is also well adapted for painting all kinds of prepared roofing and wood roofs, and also as a protection against dampness or acid fumes. Meurer's black enamel paint is another product of the concern, which is claimed to possess the same qualities a stheir roofing paint, and to be a sure rust preventive for metal roofs, iron work, pipes, &c. This paint is said to stand great heat without peeling or crackling and to absolutely retain its flexibility under all conditions.

From the office of the Wheeling Corrugating Company, at 917 Sansom street, Philadelphia, we have received an illustrated folder calling attention to the Stamped Steel Architectural Metal Work for churches, schools, theaters, hotels, public buildings and private homes manufactured by the company. The circular presents some illustrations of Sheet Metal Ceilings and Side Walls of highly artistic design, and states that estimates for material or for Ceilings arranged complete will be furnished upon receipt of application, accompanied by drawings or sketch giving measurements.

It is reported that the Southern Rolling Mills Company, to be incorporated with a capital stock of $60,000, by Ben S. Catchings, James Dwyer and W. L. Sims of Birmingham, Ala., will probably erect a Sheet Steel plant at Ensley, Ala.

THE TIN PLATE TRADE IN ENGLAND.

FROM OUR LONDON CORRESPONDENT.

Doubtless due to the present high prices of metals in the United States, the British tin plate trade has been having a rather happier time than usual. Employment has been fair, the month of January showing an improvement upon the month of December. At the end of January, 43 works, with 206 mills, had all their mills in operation, while 34 others had 179 mills at work, out of a total of 241. That makes 385 mills in work, compared with 378 at the end of December and 295 a year ago. The number of workmen employed at the end of January was, as nearly as possible, 19,200. I herewith subjoin a tabulated statement which will set the facts out clearly:

	No. of works open.	No. of mills in such works Working.	Not working.	Total
Works giving full employment	43	206	..	206
Works giving partial employment	34	179	62	241
Total at end of January, 1902	77	385	62	447
Corresponding total for December, 1901	77	378	64	442
Corresponding total for January, 1901	60	295	50	345

EXPORTS OF TIN PLATES.

I give herewith the chief totals of exports of tin plates and black plates for the month of January:

	Tin plates.			Black plates.		
	Jan., 1902.	Dec., 1901.	Jan., 1901.	Jan., 1902.	Dec., 1901.	Jan., 1901.
United States	7,977	8,406	4,673	....	37	....
Other countries	18,051	16,367	16,928	4,637	4,145	5,151
Totals	26,028	24,773	21,601	4,637	4,182	5,151

FOREIGN TIN PLATE CUSTOMERS.

With a view of showing who are England's tin plate customers, it will not be without interest if I reproduce in full the total, both in quantities and values, of Great Britain's tin plate exports for last year, together with a comparison for the previous year:

Tin Plates and Sheets.

	Quantities.		Value.		Quantities.		Value.	
	Year ended December 31.				Month ended December 31.			
	1900.	1901.	1900.	1901.	1900.	1901.	1900.	1901.
Russia	32,724	30,188	£431,207	£397,918	5,171	2,698	£75,161	£33,824
Germany	18,257	10,608	276,710	148,938	1,143	822	16,906	11,527
Holland	14,810	12,629	216,056	181,130	1,634	1,192	23,956	16,437
France	23,436	15,649	303,860	211,147	1,534	1,002	21,378	13,455
Portugal, Azores, Madeira	5,678	7,345	80,441	99,210	479	279	6,975	3,582
Italy	3,285	2,785	54,260	38,061	153	189	2,271	3,019
Roumania	2,425	3,051	31,514	40,116	168	....	1,875	....
United States	58,043	75,819	786,249	1,000,905	4,923	8,406	65,751	113,786
Brazil	4,439	3,242	74,187	45,945	441	421	6,585	6,624
Argentine Republic	4,714	3,651	73,734	50,491	356	551	5,498	8,110
British East Indies	22,676	25,558	344,725.	354,659	2,008	2,694	26,351	38,208
Australasia	19,959	17,379	322,670	251,892	1,481	1,115	22,693	16,980
Canada	22,101	16,886	338,755	245,195	1,042	1,290	16,096	19,353
Other countries	40,330	46,167	642,428	641,351	3,799	4,114	57,795	57,055
Totals	272,877	271,657	£3,976,796	£3,706,958	24,332	24,773	£349,291	£341,960

Finally, I subjoin another table giving the average number of mills in operation and the total exports of tin plates and sheets, and also black sheets, for the last six years:

Year.	Average number of mills in operation.	Exports of- Tin plates and sheets.	Black plates.
1896	318	266,963	48,405
1897	323	271,230	58,648
1898	322	250,983	58,327
1899	381	256,373	85,729
1900	384	272,877	66,278
1901	343	271,657	51,367

ORDERS FOR BLACK SHEETS.

Some large orders have just been placed in this country for black sheets for Canada, and there are inquiries for 10,000 tons more of them. Mexico is also a heavy buyer of black sheets just now, but sellers are not inclined to commit themselves at the present prices for future deliveries.

THE QUESTION OF BRANDS.

It will be within the recollection of your readers that some little time ago I drew their attention to a question which excited some interest over here as to the branding of tin plates. The movement seems to be fizzling out. This is doubtless due, to some extent, to the action taken by the Newport (Monmouthshire) Chamber of Commerce, whose secretary made various inquiries and received certain replies. With one exception these replies did not favor any alteration. The Ebbw Steel Sheet & Galvanizing Company, Limited, of Abertillery, agreed that the words suggested would more correctly describe their production, but they doubted whether the trade generally would agree to the change. They, however, favored the alteration. The Redbrook Tin Plate Company, Limited, of Pontnewydd were of opinion that the suggestion made that all coke tin plates should be called Bessemer and all charcoal tin plates Siemens-Martin would cause the greatest confusion in the trade. Charcoal and coke now only indicated the finish of the tin plate, and if the buyer wanted any particular steel all he had to do was to stipulate for it when the contract was made. The Treforest Tin Plate Works of Treforest wrote that, as they only supplied one class of plates—viz., Bessemer steel cokes—the change suggested would not afford them in any way. L. C. Corfield & Co. of Newport stated that the present custom had been long established and was so well known that they did not think it was worth agitating about. Some of the firms approached stated that they were not now makers of tin plates, and it also appeared that many of the works were stopped. It was resolved that in the opinion of the Newport Chamber it was inexpedient to alter the present method of branding in the tin plate trade.

FLASHINGS.

MANY of the Sheet and Tin Plate mills in the Pittsburgh district suffered from the flood last week. Some of them were compelled to shut down entirely, and others remained partially idle. This occurrence was particularly unfortunate, as the mills are all loaded down with orders, and any restriction of production at this time is liable to impose considerable inconvenience upon purchasers who are awaiting the shipment of delayed orders in order to complete contracts in hand.

DURING the last few days negotiations were renewed for the absorption of the American Can Company by the United States Steel Corporation. A premature announcement made this week may interfere seriously with the consummation of the project, however.

HENRY WEYAND, Waterbury, Conn., has the contract for the Cornices and Skylights for the Chapman Block in that city. He is also doing the roofing and metal work on the Schlitz Building.

AT a recent meeting of the council of the Tin and Sheet Mill Men's Union, at Swansea, Wales, President T. H. Gwynne referred to the opening of new markets in South Africa, and suggested that the men should contribute 1 shilling per month for five months. With some 10,000 men engaged in the trade this would amount to £2500. If the employers contributed an equal amount they would be able to send out men to South Africa to ascertain the possibilities of extending the trade there in Tin and Terne Plates and Sheet Steel.

THE WELSH TIN PLATE MANUFACTURERS' ASSOCIATION has invited the workmen to a conference to consider

the wage scale to be adopted after June 30, when the present agreement expires.

The International Tin Plate Workers' Protective Association, composed mainly of tin house workers, will open its fourth annual convention on Monday, May 5, at New Castle, Pa. The headquarters of the association are at present located at Wheeling, W. Va.

The American Rolling Mill Company of Chicago, who operated a steel furnace and sheet mills at Muskegon, Mich., have stopped operations at that place on account of the high price of Scrap, and it is reported that the plant may not be operated in the future.

The new Sheet mills which the Newport Rolling Mill Company, Newport, Ky., are erecting are expected to be completed early next month.

The Wais-King Tool Company, recently incorporated, have completed their plant at Winton place, Cincinnati, Ohio. The building is a two-story structure, 80 x 160 feet, well lighted and ventilated and equipped with the latest improved appliances. They are putting on the market a line of Punches and Shears with improved features.

R. Tynes Smith has resigned the local management of the American Can Company in Baltimore, Md., and has gone on a trip of combined business and recreation to Cuba and Nassau, West Indies, in the latter of which islands he has large fruit interests. On his return Mr. Smith will devote himself to his large packing interests in Baltimore. Mr. Smith's Can factory, which was one of the largest absorbed by the American Company, is now being still further enlarged and improved.

The Heppes Company, Chicago, have been incorporated to manufacture and deal in Roofing and Roofing Material, with a capital stock of $10,000, by H. W. Bennie, O. A. Heppes and John R. Philip.

Paint to Prevent Tin Cans from Rusting.

The following instructions as to the proper paint to be used for the outside of tin cans that are exposed to dampness is given in the *Painters' Magazine:*

It has long since been determined by scientific researches that linseed or any other oil is not impervious to water; on the contrary, that they soak up water almost like a sponge, hence some other preparations are required to protect metal from rust in the presence of water. We should recommend that the cans be first thoroughly cleaned, to remove all grease, &c., with soda water, then rinsed and thoroughly dried. Now a thin coat of equal parts white lead and zinc, thinned with turpentine and a little coach japan, to which good varnish—say a tablespoonful to each ½ pint of paint—is added, should be given, and when this is dry a coat of enamel, made from zinc in damar varnish, colored to suit fancy, thinned with a little turpentine and mixed with sufficient hard drying coach varnish to work freely, applied as a finish. If each coat could be conveniently baked from four to six hours at a temperature of about 150 degrees F. it would resist water far better than the air dried paint.

The seventh annual convention of the National Association of Manufacturers will be held in Indianapolis, Ind., on April 15, 16 and 17. Local arrangements for the convention are being made by a committee of Indianapolis business men under the leadership of D. M. Parry, who has been for many years a member of the Executive Committee of the association, and a particularly hospitable welcome to visitors is assured. Members of the association are manifesting more interest than usual in this year's convention and there is promise of an unusually large attendance from all parts of the country.

Sir Charles Grandison is credited with saying that bores had great charms for him, in that he could never tell what particular form of annoyance they would manifest. This applies to the action of trades union men in England, for they are prolific in surprises. In a certain locality the men struck for a trifling matter and were discharged, the proprietors engaging non-union men. Suit was at once brought against the owners of the works, ordering them to show cause for depriving the men of their living!

The Elmira Reformatory Trade School.

E. E. Clark, director of the trade school of the New York State Reformatory, at Elmira, N. Y., who was a visitor this week at the office of *The Metal Worker*, reports that important extensions and improvements are in contemplation at Elmira in connection with this department. Should the appropriations from the State be sufficient it is proposed to erect new buildings for the accommodation of the trade schools, thus systematizing the work and making it more efficient. Between 400 and 500 young men are each year paroled or discharged from the reformatory with sufficient knowledge of some trade to enable them to make an honest living when again thrown upon their own resources. Some of the inmates who spend a longer time in the reformatory are, on discharge, equipped with sufficient knowledge of the theory and practice of a trade to enable them to become journeymen. Employment is secured by the authorities for numbers of young men each year. The result of this work has been highly satisfactory. Hundreds of youths, who otherwise might have been forced to return to a life of crime, through their equipment with a means of livelihood, have been given the opportunity and encouragement to lead an honest life. Some 30 separate trades are taught at the present time in the Elmira Reformatory. Each of the inmates is obliged to take up some line of industry, and for ten hours each week is given trade instruction. Mr. Clark is convinced that this is the most satisfactory solution of the question of the disposal of young prisoners. It is the most effective reformative method yet devised.

Melting Loss in the Foundry.

A bulletin of the American Foundrymen's Association contains the following data on melting loss in the cupola which used burnt material:

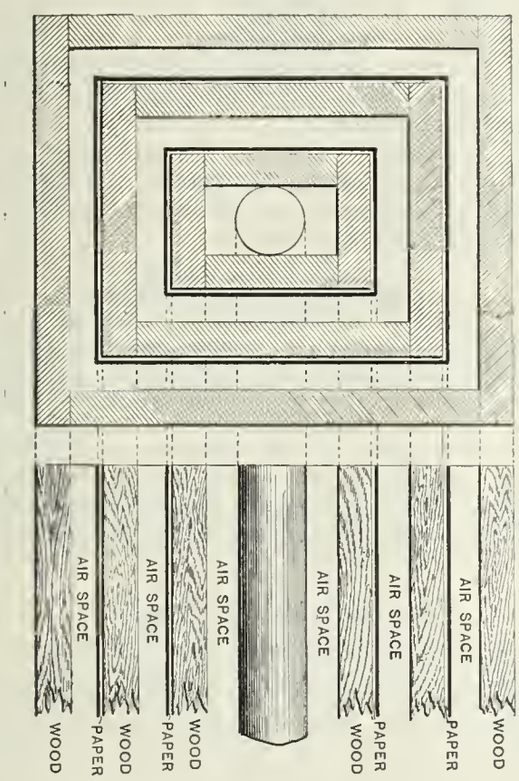
A. A selection of burnt grate bars, in fair condition, was remelted, the charge of 2000 pounds resulting in 1875 pounds of good material. Melting loss, 6¼ per cent. The castings were entirely white; 0.4 per cent. of ferromanganese was added to a quantity of the melt; this, when set, was gray in fracture. Evidently the high silicon in the ferromanganese did it. Another test with this treated material gave a depth of chill of 7-16 inch.

B. Two thousand pounds of the worst burnt grate bars were now melted, resulting in a melting loss of 8 per cent. The castings were again white, and this time the addition of 0.4 per cent. of ferromanganese had very little effect on the fracture. Similarly the chill obtained was 12-16 inch.

It is very evident that the ferromanganese, with its high silicon, expended itself in removing the oxidation effects, and could do little in promoting the formation of graphite.

It is reported that the Southern Pacific Railroad Company are making elaborate preparations to equip all the locomotives throughout their entire system for the use of oil as fuel. Experiments along this line have proved to the company the efficiency and economy of oil fuel, and they are now preparing to erect a large number of immense tanks for the storage of oil at a number of points on their lines.

The Clark Mfg. Company, Buffalo, N. Y., have recently made Allerton-Clarke Company, 97 Chambers street, New York, their selling agents for the goods of their manufacture for the territory embraced by the Eastern, Middle and Southern States, Ohio, part of Indiana, Canada and the Provinces and export. The goods of this company include the various kinds of genuine Clark's Blind Hinges and other Hinges known under various names. Loose Pin Butts, Spring Hinges, Sash Pulleys, Stove Pipe Dampers, Sash Cord Irons, Lid Lifters, Boiler Handles, Bed Fasteners, Shelf Supports, Sink Brackets, &c.



THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

PROTECT TANK PIPE FROM FREEZING.

From W. T. M., Ridgewood, N. J.—Replying to the inquiry of "S. S.," in *The Metal Worker* of February 8, in reference to protecting the supply pipe to a tank from freezing, my experience has been that I have been unable to find any non-conducting material that would protect a supply pipe to a tank from freezing, and I have tried all the best loose and sectional nonconducting materials that have been recommended and placed on the market. I have always found, after the covering has been on for one year, that it would help freezing in the pipe, owing to dampness brought on by the atmosphere. I have experimented with the different methods of wrapping, covering, boxing, &c., and the method that I suggest to "S. S." will absolutely prevent the water in the pipe from freezing if the temperature be 20 degrees below zero. Place around the supply pipe what may be termed a three-ply box, a cross section and an elevation of which are shown herewith. This box must be attached to the bottom of the tank with an air tight connection and must extend at least 3 feet into the pit below the ground. Each section of the box should be made of ⅞-inch finished pine boards or something equal. The first box, in order to cover a 2-inch pipe, should be 4 inches wide to allow for laps, and 2¼ inches deep from front to back. This leaves an air space all around the pipe. When this has been connected to the bottom of the tank, so as to be air tight, it should be wrapped with sheathing or manila paper from top to bottom carefully, so as to be as near air tight as possible. When this has been completed 1 inch square cleats should be nailed on the box about 5 feet apart, to which the outer boxing or next ply of the box is to be fastened, equalizing the air space all round. When this has been completed, taking the same care to make an air tight connection at the bottom of the tank, it should be wrapped with the paper the same as the first ply. On the outside nail more cleats of the same size to provide an air space, and put on a third box, to be made of 12-inch wide finished boards, which can be painted to preserve them. The second ply can be made of 8-inch boards. If "S. S." will adopt this method I can assure him that he will profit by it, for having met with the best success in using this method for the last eight years I can say from experience that it is better than anything else I have tried. I have experimented with it and given it the severest kind of test and I have never had a frozen pipe which has been protected in this manner.

Protect Tank Pipe from Freezing.

WANTS A PRACTICAL WATER HEATER.

From W. W., New York.—There seems to be a demand in these days, even in small two-family houses, for hot water, to be supplied by the owner the year round, as well as heat in the winter. The trouble with the kitchen boiler is that in summer the occupants of the house seldom use the coal range, depending entirely upon the gas stove. Consequently there is no supply of hot water when it is needed in the heated season. How to overcome these difficulties economically seems to me to be an interesting topic for discussion. There are many contrivances on the market to supply hot water, such as the gas attachment to the kitchen boiler and the instantaneous water heater, but, so far, these have been too expensive in operation or in first cost to suit the demand. The regular hot water supply heating apparatus and a coil contrivance in the cellar furnace depend on the kitchen boiler, and consequently are useful only in winter. I cannot answer this question to the satisfaction of myself or my customers, and hope that the readers of *The Metal Worker* can alleviate the conditions by throwing some further light upon them.

RETINNING COPPER WARE.

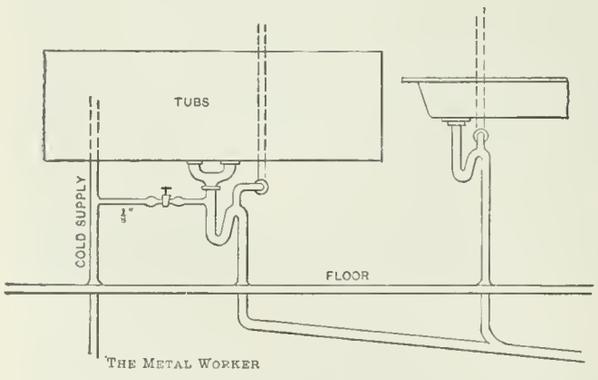
From E. & J., New Britain, Conn.—Will *The Metal Worker* please explain how to retin old copper, and how to clean it properly so that the tin will adhere to it, particularly as to retinning of old wash boilers and old coffee kettles?

Answer.—The following article from a special contributor is reprinted from a previous number of *The Metal Worker:*

For the benefit of those who, without previous experience in this kind of work, may be called upon to retin copper cooking utensils, at the outset it is to be kept in mind that only the most careful attention to every part of the work will give good results. The finish obtained on the tinned article will depend on the thoroughness with which every part of the work is done. We will suppose that we have a small portable forge to work on, as it is the best for the purpose. A fire of charcoal or coke is to be preferred, as the heat is more diffused than with coal. Having a bright red fire we will take the articles just as they come to us from the hotel, ship's galley, &c., and, placing them one at a time on the fire, keep turning it until it is heated all over. It is allowed to heat until it turns black inside. We have beside us a quantity of sal ammoniac, which has been pounded into a fine powder, and we sprinkle it a little at a time over the whole inside. Taking a wad of tow, which can be obtained at a ship chandler's or rope factory, or even can be made by teasing out a new rope, we wipe out all the burnt grease, wiping firmly round the inside, taking care to clean around the handle rivets.

We now take our copper off the fire and allow it to cool till we can just bear our hand on it, and then pour into it enough raw muriatic acid to cover the bottom to, say, a depth of ½ inch. The acid is swilled around the inside with a rod having a wad of tow tied on the end. It is best to allow the acid to remain in the vessel for a few hours, swilling it, say, once every hour or two, as may be necessary. The acid is now poured out to be used again and the pot washed in water. With a handful of tow and some wet, sharp sand, we now scour the inside, and if the burning and pickling have been well done it will be found it is quite clean and smooth. If the work is meant to have a gloss and have a surface feeling like glass to the touch, it must be scoured a second time with very fine sand that contains no gritty matter. A little experience will enable the workman to pick out such places as will not tin properly or appear rough on the finished articles, and at this stage they must be scraped. The scraper should be broad and sharp, and leave no marks to be seen through the tinning.

Having scoured the outside bright, we wash out in cold water and cover the inside with pounded sal ammoniac diluted with water. The outside is also covered with whiting and salt. Taking a handful of whiting and



just covering it with salt will give about the right proportions. Mix it into a paste with water. The article is now ready to tin, so we put it on the fire and heat it, turning it till it is heated evenly all over. When it has reached the proper temperature it will melt a few pieces of pure block tin which have been placed in it. We now, beginning on the bottom, with a wad of clean tow wipe the tin all over it and cover it completely. It is well to sprinkle just a pinch of sal ammoniac on the copper if it does not tin nicely, but we are to remember that the fumes from the sal ammoniac are very apt to cause the job to appear white instead of brilliant. We now turn the pot on its side and wipe the melted tin around a portion at a time till it has covered every part, then wipe the surplus tin with a quick motion into a pan placed beside the fire. It is advisable to have some muriatic acid, which has been cut with zinc, at hand, and to daub it on any spot over which the tin does not flow well, but the hot copper should not be scraped if it can be avoided.

Without allowing the article to cool we put it back on the fire, and with a wad of cotton waste, free from grease but dipped in very fine ashes, we go all over the inside again, beginning in the center of the bottom and wiping spirally toward the sides. No sal ammoniac nor acid is to be used this time. We wipe the sides with somewhat of a zigzag motion while working gradually around. This part of the work may require a little practice to accomplish the best results. Before the copper has cooled we plunge it into clean, cold water, and wash off the whiting and salt from the outside. The inside should not be touched at all, and care must be taken to change the water frequently, for the least salt, sal ammoniac or acid in the water will turn the inside dark in color.

If the copper has become cold while we were working it off we must immerse it in hot water, and lifting it out quickly dry it outside by rubbing in a box of sawdust. The article should not remain exposed to the air after it has been washed and before it is dried or it will tarnish. It may be necessary to give the outside a second scouring after the article is tinned, if it is found that the sand has left it dull. That, however, depends on the nature of the sand. A good plan to get the proper finishing sand is to wash out the scouring wad in water, and take the sediment that will accumulate in the bottom of the vessel we wash in. If every part of the process is carefully done, with a little practice the workman will have very little difficulty in turning out a good job. The inside and outside will be perfectly smooth and have a nice gloss.

QUESTIONS ON WASH TRAY TRAPPING.

From H. A. K., Allentown, Pa.—Having seen the articles on the above question in *The Metal Worker* of February 8 and March 1, I give as follows my views on the

Questions on Wash Tray Trapping.

matter: The connections as shown in Fig. 2, February 8, I think, are correct and perfectly sanitary, but if there should be any possibility of the seal being broken in the trap under tubs I think that the addition of a running trap, as shown in the cut of *The Metal Worker* March 1, would be very unadvisable, as the distance from the running trap to the tubs is too great and there would naturally be a foul odor coming out at the wash trays. Now I think that by connecting the trap according to sketch herewith all difficulties would be overcome. To always keep the trap under the wash tray sealed allow the water from the tub supply to constantly run into the trap through a ⅛-inch pipe, as shown, and regulate the amount by a small cock.

SAFETY VALVE ON KITCHEN BOILER.

From F. V., Chestertown, N. Y.—I am going to install a kitchen boiler where the water pressure is very light. Would it be advisable to place a safety valve on the boiler? The air collects occasionally in the pipe between the house and the spring which supplies the water and stops the flow. Never having used a valve of this kind, I would like to know the kind to use and the manner of connecting it with the boiler.

Answer.—There seems to be no occasion to place a safety valve on a boiler under the conditions mentioned, provided the boiler has a delivery tube with a hole in it near the top. Then should the flow of water from the spring stop from any cause the boiler would remain full of water, and this would circulate through the water back and prevent its destruction. If, while the fire is running strong, the water supply should stop, it might result in steam being generated, but as this steam could exert its influence to drive the air out of the supply pipe and start the flow of water again there would be no danger of the boiler being burst from excessive pressure. If, however, the safety valve is deemed necessary it can be furnished by any supply house.

WANTS SOLDERING FLUX FOR ALUMINUM.

From A. N. Y., Ashley, Ohio.—Will *The Metal Worker* please ask some of its readers to give a good solution for soldering aluminum?

Note.—We shall be glad to present anything our readers may contribute on this subject. In the meantime we would refer our correspondent to the flux given in *The Metal Worker* of March 8.

ADDRESSES WANTED.

Will "F. H. W." of Parkville, N. Y., whose application for assistance with a troublesome chimney was presented in *The Metal Worker* of January 18, please send in his address, as there are communications awaiting him that may be of interest to him?

We have received a communication from "Reader," Lexington, Ky., but before presenting it desire his name and address, as requested at the head of the Letter Box department.

An Aluminum Solder.

The following recipe for soldering aluminum, which is claimed to do the work effectively, is given in a contemporary: Twenty-eight pounds of block tin, 14 pounds of phosphor tin—10 per cent. phosphorus—3½ pounds of lead and 7 pounds of spelter. The following instructions should be followed when soldering aluminum: Clean off all dirt and grease from the surface of the metal with benzine, apply the solder with a copper bit, and when the molten solder covers the surface of the metal scratch through the solder with a wire brush, by which means the oxide is broken and taken up. Quick manipulation is necessary.

Jacob S. Wolf and Louis K. Englert of West Catasauqua, Pa., are the discoverers of an alloy of metal produced by the admixture of copper, tin, iron and salt. The metal, it is claimed, may be used for all general purposes, such as the manufacture of tools, armor plates and other products where a tough, strong and durable material which will not corrode is desired. The composition consists of 85 parts of copper, 4 parts of tin, 6 parts of iron and 5 parts of salt.

It is well known that a free use of oil will surround a vessel with a comparatively smooth water even in the roughest storm. An experiment has just been successfully made in England with a cannon that throws a shell designed to spread oil on bolsterous waves. A shell made of wood, containing about 2 gallons of oil, is used. It is conical, and at one end is a vent; this is covered with paper, which is blown off as the shell leaves the piece. The apparatus is intended to provide a smooth path through which a lifeboat can make its way to disabled vessels.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is 1c. higher, owing to light arrivals.

Copper is quiet, with stronger tone.

Pig Lead is unchanged.

Spelter continues dull and without change.

Antimony shows no change.

Nickel is in good demand at former prices.

Aluminum is active and without change.

Tin Plates are firm and quiet.

Sheets are very strong and demand urgent, on prospect of scarcity.

Sheet Copper is in good demand, and firm in price.

Scrap Iron is very strong and scarce.

Scrap Brass and Copper are strong and higher.

Foundry Iron is growing scarcer, and prices are advancing.

Hardware is in excellent demand, with strong tone.

Solder rules ½c. higher.

Malleable Fittings have been advanced 10 per cent.

Cast Iron Soil Pipe and Fittings are very strong, and may advance again.

Radiators are about 10 per cent. higher.

Wire Cloth is firm, with upward tendency.

Poultry Netting is also firm, with large demand and outlook for higher prices.

Cold Punched and Hot Pressed Nuts have been advanced in price.

Sash Weights rule somewhat higher.

Wire Nails are very firm and active.

Cut Nails are firm with light stocks.

Window Glass may be advanced slightly.

White Lead is moving freely, with prices firm.

Linseed Oil is firm at former quotations.

Spirits Turpentine is ½c. a gallon higher.

METAL MARKET.

NEW YORK, March 14, 1902.

Pig Tin.—Owing to meager arrivals the price of spot Tin has advanced about 1c. since last week. Futures are not so strong, however, and have sold at a considerable discount. Trading was not heavy either in spot or futures. Consumers are buying very cautiously, and aside from the tardy manner in which the metal is coming in there were no interesting features in the market. At the close a somewhat easier tone prevailed, but spot prices showed no decline. Straits Pig in small lots is quoted by jobbers at 27½c. to 28c. per lb.

Copper.—The market for Copper has been very quiet. The undertone, however, is much stronger than it has been for some time, while the consumptive demand shows some improvement. Jobbers' prices are unchanged, Lake Ingot in small lots being quoted at about 13¼c. to 13¾c. per lb., and Casting Copper at about 13¼c.

Sheet Copper.—The demand for Sheet Copper keeps up in good volume and inquiry is active. Consumers are apparently of the opinion that the price of Sheet Copper is not likely to decline in the near future, and in consequence are placing their orders more freely. A large consumption of the material is looked for this year in all quarters. Prices are firm on the basis of 18c. per lb. from store.

Pig Lead.—The market is entirely unchanged and without interesting feature. The business done was of moderate proportions and confined mainly to purchasing for immediate requirements. Prices are firmly held. American Pig, in small lots, is quoted at 4.45c. to 4½c. per pound. The St. Louis market is reported quiet with unchanged prices.

Spelter.—But little is doing in this metal. The market continues dull and a shade lower for wholesale lots. Retail prices are unchanged, Western brands in small lots being quoted at 4.60c. to 4.70c. per lb. The market in St. Louis was quiet but firm.

Antimony.—This metal is without change. Hallett's is quoted at 8⅝c. to 8¾c. per lb. in small parcels; U. S. at 8⅝c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—No change has taken place in this market. Small lots are quoted at about 55c. per lb.

Aluminum.—There is no change either in price or in the volume of business, which continues good. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—Nothing new is to be noted in connection with this market. Deliveries on contracts are being made in large volume, and current orders are of routine type. Nothing important in the way of large new business has come to the surface, and the retail trade in this section has been rather dull, owing to weather conditions, which have interfered with out of door work and also with communications. Prices are entirely without change. American Bessemer Coke Plates, IC, 14 x 20, in small lots, are selling at about $4.85 to $5 per box at New York and corresponding points.

Sheets.—The Sheet market continues to show great activity, and prices are very firm but no higher. Notwithstanding that the output of both Black and Galvanized Sheets is heavy, there is still complaint of delay in deliveries on contracts, especially on some of the more popular gauges. All the mills are comfortably filled with orders for the next two or three months. The floods have interfered somewhat with shipments, which accounts in a measure for the delays in receipt of material. The prospects indicate a considerable shortage of Sheets during the spring and summer months, which fact tends to further stiffen the market. Jobbers' prices are very firm. No. 27 One Pass Cold Rolled Soft Steel Sheets, in small lots from store, are quoted in New York at 3.90c. to 4c., and Galvanized Sheets at 67½ and 5 per cent. to 70 per cent. off the list.

Chicago advices are as follows: A great deal of business in Sheets is now being done, with all mills well sold up and prices ruling firm. The mills are far back on deliveries of 10 to 14 gauge, and importations of these sizes are now being made for local consumption. Jobbers quote small lots at 3.35c. to 3.45c, for No. 27 Black, and 70 and 5 for Galvanized.

Old Metals.—The demand is urgent for all kinds of Scrap Iron, and prices have again stiffened. Scrap Metals in general are active and firmer, especially in the line of Old Brass and Copper. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 11¼c.
Light and Tinned Copper	per lb. 10 c.
Heavy Brass	per lb. 8¾c.
Light Brass	per lb. 6¼c.
Lead	per lb. 3¾c.
Tea Lead	per lb. 3⅜c.
Zinc	per lb. 3 c.
Pure Aluminum Sheet	per lb. 25 c.
Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 15¾c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	to $5.00
Wrought Iron Scrap, per gross ton	$13.50 to 14.00
Heavy Cast Scrap, per gross ton	12.50 to 13.00
Stove Plate Scrap, per gross ton	9.50 to 10.00
Burnt Iron, per gross ton	7.50 to 8.00

THE PIG IRON MARKET.

NEW YORK.—The conspicuous feature of the market is the scarcity of spot Iron, and in some instances fancy prices have been paid. There have not been any sales of special magnitude during the week. Northern furnaces have further advanced prices. We quote for Northern Irons: No. 1, $19 to $19.50; No. 2 X, $18 to $18.25; No. 2 Plain, $17.50 to $17.75; Tennessee and Ala-

bama brands, No. 1 Foundry, $16.75 to $17; No. 2 Foundry, $16.25 to $16.75; No. 1 Soft, $16.75 to $17; No. 2 Soft, $16.25 to $16.50; No. 3 Foundry, $15.50 to $15.75; No. 4 Foundry, $15 to $15.50.

CHICAGO.—Transactions for the week have run to special grades and qualities rather than ordinary common Foundry Iron. Business in Foundry Iron has not been light for lack of inquiry, but because the furnace companies appear to have deelded upon a waiting polley, having a great deal of business booked for forward delivery, and they are inclined to wait until the outlook becomes more definitely settled. A sharp demand exists for spot Iron, caused by the slow deliveries now being made on contracts. Sales of Northern No. 2 Foundry Iron are being made at $18.50 and No. 2 Soft Southern at the same price. Our quotations are nominal to some extent, but especially on Southern Iron. The leading Southern produeers have not advanced their schedule of prices, but it is understood that practically nothing is available except at prices $1 or $2 per ton higher. We quote as follows:

Lake Superior Charcoal	$20.50 to $21.50
Local Coke Foundry, No. 1	18.50 to 19.00
Local Coke Foundry, No. 2	18.00 to 18.50
Local Coke Foundry, No. 3	17.50 to 18.00
Local Scotch, No. 1	18.50 to 19.00
Ohio Strong Softeners, No. 1	19.60 to 20.00
Southern Silvery, according to Silicon.	16.90 to 17.15
Southern Coke, No. 1	16.40 to 16.65
Southern Coke, No. 2	15.65 to 15.90
Southern Coke, No. 3	15.15 to 15.40
Southern Coke, No. 1 Soft	16.40 to 16.65
Southern Coke, No. 2 Soft	15.65 to 15.90

PHILADELPHIA.—Sales have been on a small scale, in view of the unusual feeling of anxlety whieh the trade are experieneing. Makers are not inclined to book any more orders for future delivories at their nominal prices, and consumers are equally unwilling to pay advances. For early delivery almost any price will be paid to tide over the next two or three weeks. Prices, therefore, are entirely problematieal and it is almost impossible to quote them with anything like accuracy. The few sales at whieh actual figures have been given were at $18.75 to $19.25 for No. 2 X Foundry, deliveries to commence in Mareh and continue to July. For the present the range would be about as follows for city and nearby deliveries:

	Deliveries to July.	Deliveries July to December.
No. 1 X, Foundry	$19.25 to $20.00	$18.50 to $19.00
No. 2 X, Foundry	18.75 to 19.25	17.00 to 17.50
No. 2, Plain	18.00 to 18.50	16.50 to 17.00

PITTSBURGH.—The Pig Iron market is in that condition that it is not a matter of prices, but where to get the metal. The furnaces are praetleally sold up to October and spare Iron is bringing almost any price the seller eares to ask. The Foundry Iron market is impossible to quote. For the second half of the year Northern No. 2 is $17 to $17.50, but sales of No. 2 for prompt shipment have been made at much higher prices. The leading Southern produeers are holding No. 2 Foundry at $12, Birmingham, and the freight rate is $4.15, whieh makes prices on these Irons $16.15 delivered at Pittsburgh. However, the Southern produeers are sold up and are therefore unable to quote for early delivery. It is pretty certain that prices of Pig Iron will be higher, although it is recognized that prices are quite high enough now to give the furnaces a very handsome profit.

CINCINNATI.—The general characterlstics of the Pig Iron market are practically what they were a week ago, and the probabilities of a very material change in conditions are small for the immediate future. The ideas of furnaces as regards prices are widely separated and values are estimated to range from $12 to $13.50, Birmingham, for No. 2 Foundry. Trading is very quiet just now, to the evident satisfaction of the majority of selling interests. Quite a number of furnaces have withdrawn from the market, chiefly on account of the difficulties in delivery of stock already sold. Some furnaces are asking above the quotations given herewith, and they may be and likely are doing some selling at higher figures, especially for nearby delivery, but nevertheless prices given below fairly represent the market. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$15.25 to $15.75
Southern Coke, No. 2	14.75 to 15.25
Southern Coke, No. 3	14.25 to 14.75
Southern Coke, No. 4	13.75 to 14.25
Southern Coke, No. 1 Soft	15.25 to 15.75
Southern Coke, No. 2 Soft	14.75 to 15.25
Southern Coke, Gray Forge	13.75 to 14.25
Southern Coke, Mottled	13.75 to 14.25
Ohio Silvery, No. 1	18.00 to 18.50
Ohio Silvery, No. 2	17.50 to 18.00
Lake Superior Coke, No. 1	18.35 to 18.60
Lake Superior Coke, No. 2	17.85 to 18.10
Lake Superior Coke, No. 3	17.35 to 17.85

CHICAGO REPORT.

Scrap Iron and Steel.—Everything in the line of Old Iron and Steel ean be readily sold. We quote dealers' buying prices for carloads lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	13.00 to 13.50
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 8.50
Sheet Iron and Hoops	8.00 to 8.50
Plow Steel	11.50 to 12.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	7.00 to 7.50
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—The demand is good, the trade has adjusted itself to the new conditions, and consumers are freely buying to cover their wants. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11½c.
Copper Bottoms	10½c.
Copper Clips	11 c.
Red Brass	12 c.
Yellow Brass	8 c.
Red Brass Borings	9 c.
Yellow Brass Borings	7¼c.
Light Brass	7 c.
Pipe Lead	3.87½c.
Tea Lead	3.35c.
Zinc	3 c.
Tin Foil	19 c.
Pewter, No. 1	16 c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—Quite a demand for Rubber Shoes sprung up about the first of the month, and prices advaneed to 7½c., but this brought out a flood of offerings and the price speedily reeeded. As the usual spring collection will soon begin, prices are expected to continue low. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6¾c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6½c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—Holders of Rags awaiting an advanee have had their hopes blasted. As spring is now at hand, and new collections will soon be in, they are falling over each other trying to dispose of their stocks and prices are declining. Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 70 to 75c. per 100 lbs. in any quantity.

Anthracite Coal.—Balmy weather has caused the market to be very quiet. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE HARDWARE TRADE.

Business continues to feel to some extent the effect of the inclement weather which recently prevailed over so large a portion of the country, but the interruption is apparently unimportant, and business is characterized by an excellent volume and a cheerful tone. Interference with the production of goods, as plants were stopped or injured by the freshets, is perhaps the most serious effect which the trade still feels. Merchants generally are so thoroughly convinced that they will enjoy a heavy demand for seasonable and other goods this spring that they are not only purchasing for immediate shipment, but are placing orders for future delivery. Many jobbing houses find, in fact, that the trade is so active that it is difficult to give orders as prompt shipment as they de-

sire. In several lines it is evident that there will be a scarcity during the season, and even now such goods as Screen Wire Cloth and Poultry Netting are becoming difficult to obtain from the manufacturers, most of whom have sold nearly, if not all, their season's output. In this and similar conditions which prevail in many lines there is obviously no necessity for jobbers to cut prices as liberally as they often have done, an opportunity being afforded of realizing a full margin of profit. In several lines advances have recently taken place, indicating in a general way the strength of the market. Heavy Hardware jobbers in the West report the demand for iron and steel and the various lines they carry as very heavy, and in some cases in excess of anything previously experienced.

NOTES ON PRICES.

Malleable Fittings.—The manufacturers of Malleable Fittings of all kinds and sizes withdrew prices on the 11th inst., and immediately quoted new discounts which advanced these goods 10 per cent. over previously prevailing prices. It is said that all the plants manufacturing Malleable Fittings are still behind in the delivery of last year's orders, and that it will be impossible for them to complete their last year's business before May 1. It is owing to these conditions that an advance has been made. Malleables in lots up to 500 pounds are now quoted to the trade at 50 per cent. discount, and, if the present conditions continue much longer, there is a likelihood that they will go still higher.

Radiators.—On March 10 the A. A. Griffing Iron Company, Jersey City, N. J., advanced all prices on Radiators. The new prices are practically 10 per cent. higher than those previously quoted. It is understood that these prices will not prevail very long, and that the continued advance in Pig Iron will necessitate another revision of prices in the very near future.

Cast Iron Soil Pipe and Fittings.—The manufacturers of Cast Iron Soil Pipe and Fittings, it is rumored, are contemplating another advance in prices. It is said that the scarcity of Pig Iron has had more to do with the price of Cast Iron than the recent advances in Pig Iron have had. It is understood that all of the Cast Iron Pipe plants are pretty well covered for their Pig Iron wants, but that deliveries are not at all adequate to the demands made of the foundries, and, as a result, a stringency in Cast Iron Soil Pipe and Fittings gives the manufacturers an opportunity to make increased profits on their limited product. The trade need not be surprised at any movement in the market. At the present time opinions are more or less unbalanced. The conservative element among the manufacturers is not favorable to an advance, whereas the radical, opportunist element is anxious to make all the money possible out of the present conditions. None of the manufacturers of Cast Iron Soil Pipe and Fittings are outside of the Manufacturers' Association, and all of them are credited with making a fair profit on their product; but the majority of the manufacturers seem to think that the present is a very inopportune time to make another advance, for coming, as it would, upon the heels of the last change, they believe that it would breed considerable hostility among the jobbers; at least that seems to be the opinion of some of the leading jobbers hereabouts.

Solder.—The sharp advance in Pig Tin has been followed by higher prices for Solder. Jobbers are now quoting small lots of Half and Half, guaranteed, at 17½c. to 18c. per lb., and No. 7 at 15c. to 16½c.

Wire Cloth and Poultry Netting.—The market for Wire Cloth and Poultry Netting is decidedly firm, and has an upward tendency. This is owing more especially to the fact that the manufacturers have sold practically their entire product for the season. Under these conditions, with the excellent demand which exists and the prospect for heavy business during the next few months, there is little doubt that a scarcity in these lines will be developed.

The American Wringer Company.—In connection with the issuing of their new catalogue, the American Wringer Company, 99 Chambers street, New York, are sending out a new price-list giving net prices on their entire line. As representative of the goods of the company we give the following prices on their leading machines most generally carried in stock by the trade throughout the country. These prices apply to case lots, which will be delivered f.o.b. on cars in Woonsocket, R. I.; Auburn, N. Y.; New York City, and Chicago; terms 60 days, with 2 per cent. discount for cash in 10 days and 1 per cent. for cash in 30 days:

Royal.

Size of Rolls.		Size of Rolls.	
10 x 1¾	$26.00	10 x 1⅞	$30.00
11 x 1¾	30.00	11 x 1⅞	35.00
12 x 1¾	34.00	12 x 1⅞	40.00

Universal, Novelty and Keystone.

Nuts.—An advance was made by the manufacturers on the 25th ult. in the prices of Cold Punched and Hot Pressed Nuts.

Sash Weights.—A meeting of Sash Weight manufacturers from all parts of the United States was recently held at Cincinnati, at which the National Sash Weight Makers' Association was organized. At this meeting a scale of prices was adopted for different sections of the country, according to the local prices of raw material and cost of manufacture. The officers of the association elected for 1902 are as follows: President, Martin Andrews, King & Andrews, Chicago; vice-president, E. E. Brown, E. E. Brown & Co., Philadelphia; secretary and treasurer, J. C. Brainard, Johnston & Jennings, Cleveland. Executive Committee: N. S. Calhoun, Cleveland; J. E. Price, Chattanooga, Tenn.; Ewald Over, Indianapolis; B. H. Frey, Waterbury, Conn.; Martin Andrews, Chicago; E. E. Brown, Philadelphia; J. C. Brainard, Cleveland. The manufacturers are working together in harmony and the market has a firm tone with somewhat higher prices.

Wire Nails.—Owing to the floods shipments of Wire Nails from mills have been seriously interfered with. Some of the mills have been damaged by water to such an extent that a week or two will be required before operations can be resumed. The empty kegs have been washed away and the stock of Nails on hand will have to be retumbled. These conditions are keenly felt at the present time, when many purchasers are anxiously awaiting deliveries of Nails. Stocks of Wire Nails in the hands of New York jobbers are now badly broken in assortment, owing to delayed deliveries from mills. The market is very firm, small lots from store being quoted at $2.25 to $2.30 per keg.

Cut Nails.—The advance of 5 cents per keg on Cut Nails, noted last week, is firmly maintained. As a rule the New York jobbers have not large stocks on hand. Small lots from store are quoted at $2.25 per keg.

Window Glass.—The Window Glass market is devoid of new developments. There is very little Glass used at this season, and buyers do not seem disposed to anticipate their requirements to any great extent. It is rumored that the Jobbers' Association contemplate making a slight advance in the price of Window Glass, with a view of stimulating the demand.

White Lead.—The prospect of spring business in White Lead in Oil is encouraging and an increased inquiry is reported. Quotations are firmly held at 6½

cents per pound for lots of less than 500 pounds, and 6¾ cents for small quantities.

Linseed Oil.—The unsettled weather has not been conducive to the distribution of Linseed Oil. Many of the large buyers are said to have their requirements covered for some months to come. It is anticipated, however, that with improved weather conditions the demand will improve. The market is firm at former quotations, City Raw in small lots being quoted at about 64 cents per gallon, and out of town Raw at 63 cents.

Spirits Turpentine.—Reports of a firm and advancing market in the South have stiffened prices at this point. The demand, however, is only moderate. Small lots of Turpentine are quoted at 46 to 46½ cents per gallon.

The Illinois Metal Company.

The Illinois Metal Company, located at Granite City, Ill., who organized about one year ago, are reported to have grown rapidly and the company are now preparing to increase the facilities for their output of babbitt metal, solder, bar lead, bar tin, &c. It is said that their babbitt metals are in use in many large foundries and rolling mills, and the constantly increasing volume of orders for the various kinds of metal which they manufacture is substantial proof of its favor in the trade. A large part of their product is shipped to the St. Louis market, which is near at hand, but the company are also building up a substantial trade throughout the country. They are sending out circulars with full information concerning their products, and will be pleased to forward the same to any interested parties. M. F. Niedringhaus is president and E. H. Niedringhaus is secretary and treasurer of this company.

Peerless Aluminum Enamel.

Nickel Plate Stove Polish Company, Chicago, Ill., are directing attention to their Peerless aluminum enamel. As aluminum enamel is now in great request for use on exposed plumbing, radiators, screens, railings, stove trimmings and a host of other articles, the company have brought out their own preparation for the purpose. It can be used on any surface on which a bright enamel finish with frosted silver effects is desired. It needs no polishing, and may be washed the same as nickel. It is stated that, being moisture proof, and preventing rust and decay, it is of great value for exposed metal work. It can also be applied to articles made of canvas and leather.

A Heat Indicating Paint.

Users of machinery, says the London *Ironmonger*, will be glad to hear that a paint composition has been invented by a German chemist which will indicate visibly the heating of any particular portion of the metal work. This paint is composed of iodide of mercury and iodide of copper amalgamated in equal quantities and made into a paste by the addition of distilled water. It is painted upon the surfaces of portions of the machinery liable to heat. When cool the paint remains red; but as soon as it reaches a temperature of 140 degrees F. it turns black. On cooling down again it once more returns to its original red color.

Bed Warmers.

During the recent cold spell there developed, according to a contemporary, a considerable demand for electric bed warmers. This apparatus consists of a coil of wire hermetically sealed in asbestos. Through the coil an electric current is passed either from a direct live wire or from a storage battery, thus heating the surrounding asbestos. The machine is nothing less than a stove. It can be used either under the sleeping couch or between the coverlets, and is a great advance over the old hot water bag heating method.

For country use the Japanese stove is popular. This gives the same results as the electric stove, but differs in its mode of accumulating heat. The Japanese article is literally a smoldering fire after the punk or charcoal inside is lit at both ends. There are no fumes or smoke emitted. The Japanese bed warmer is much lower in price than the electric, and may be found as cheap as 10 cents, although this small size is called a hand warmer, and is carried in the pocket. Hospital authorities, it is said, are experimenting with these bed warmers with a view of getting something practical to warm the beds of ambulances.

The newly elected Board of Directors of the Chamber of Commerce of Pittsburgh have appointed a committee of five members to take up the project of a greater Pittsburgh. The scheme is to consolidate Pittsburgh, Allegheny and surrounding boroughs, including McKeesport, Braddock and other large places, which would give Pittsburgh a population of nearly 2,000,000. If the project goes through on the scale proposed it would make Pittsburgh the third city in the Union in population.

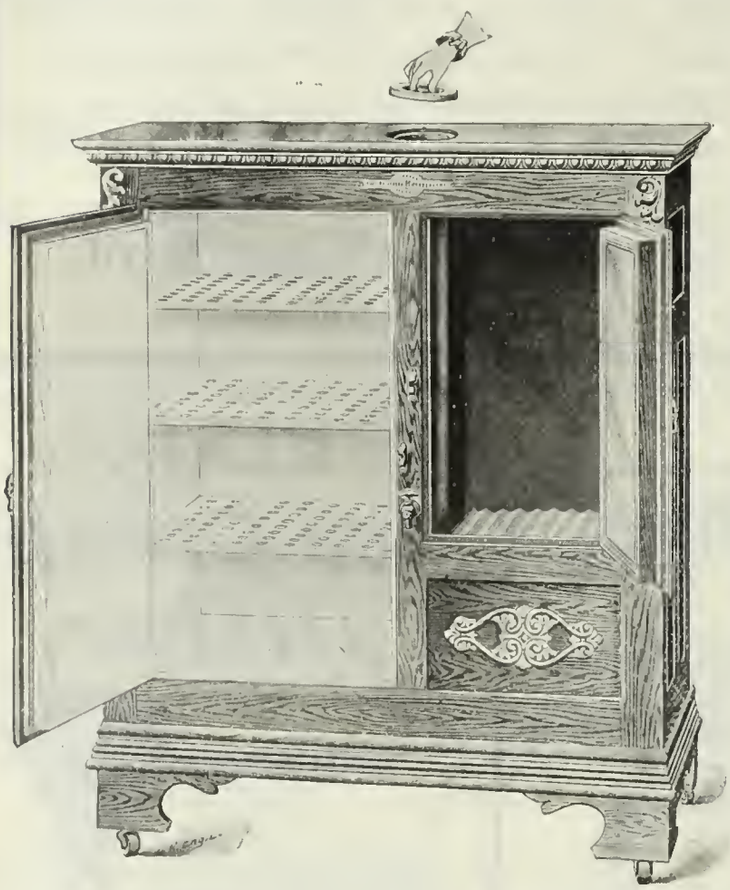
RURAL FREE DELIVERY

THE SIGNAL MAIL BOX
BATES-HAWLEY PATENT.



A POSTOFFICE AT YOUR DOOR

THE SIGNAL MAIL BOX, Bates-Hawley Patent, IS THE ORIGINAL BOX FOR RURAL SERVICE. It has been especially recommended by the Postmaster General

It is the largest, and the only box full government size, 18 in. x 6½ in. x 11½ in., and the only one which meets all the requirements. 7½ million dollars just appropriated for extension of rural service this year. From 100 to 1,000 boxes will probably be put in in your vicinity. You should sell them. Write us for prices.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.
Materials Used in Galvanizing.
Building and Setting Kettles.
Removing Scale with Sulphuric Acid.
Cleaning Sandy Castings with Sulphuric Acid.
Preparing the Work for Dipping in the Zincing Bath.
Drying the Work.
The Heat of Zinc.
Dipping the Work in the Molten Metal.
The Formation of Dross in the Kettle.
Running Over, or "Sweating," Zinc Dross.

Tinning Malleable Iron, Wrought Iron and Steel.

Preparing the Work.
Tools and Kettles.
A Tinning Plant.
Plan of Tinning Plant.
Removing Scale and Rust with Sulphuric Acid.
Cleaning Sandy Castings by Sulphuric Acid.
Cleaning Sandy Castings with Hydrofluoric Acid.
Removing Paint or Grease.
Tinning with a Single Kettle of Tin.
Tinning with Two or More Kettles of Tin.
Passing the Work Through the Tinning Kettles.
Tinning Wire in Coils.
Tinning Steel Spoons and Similar Articles.
Retinning.
Setting Retinning Kettles.

TINNING COMMON GRAY IRON.

Description of Tinning Plant.
General Considerations.
Tumbling Barrel.
Freeing Gray Iron Castings from Sand by Hydrofluoric Acid.
Cleaning Sandy Castings with Sulphuric Acid.
The Use of a Hot Alkali Bath in Certain Cases.
Preparing the Castings in the Gas Barrel.
Coating the Castings with Tin.

Patent Pending.

Iwan's Perfection Wire Conductor Pipe Hanger.

Best Hanger Ever Invented.

Why It Is The Best:

1st. It holds pipe one inch from building to permit painting.
2d. It looks ornamental.
3rd. It can be used for frame or brick buildings.
4th. It can be used for round or corrugated pipe.
5th. It completely encircles the pipe, holding it firmly on all sides
6th. It is strong and durable.
7th. It is cheaper than any other hanger.
8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe 2½ inch hanger is required. Other pipe runs uniform.

Also Manufacturers of Iwan's Chimney Top.

A Few Points About
The Dover Elbow:

No unsightly seams or corrugations standing out to give it a bunched appearance.
The outside can be polished, as it presents a smooth, even appearance.
The seams are folded on the inside.
No corrugations to reduce diameter and collect soot.
No seams to corrode and rust.
It is made on a scientific principle. It is the same diameter as the pipe.
It is handsome. It is strong. It is the best elbow on the market.

TINSMITHS HELPER *and* PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION

A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion **$1.00**

Section 1 ⁘ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ⁘ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ⁘ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

MASTERS OF THE CEILING SITUATION

We are **THE RIGHT PEOPLE** to question about **METAL CEILINGS**; we know the Metal Ceiling business from A to Z.

Our ceiling plates are the deepest stamped; they are also the most artistic.

We lead in variety of patterns. In the past year, we have brought out more new artistic designs than have all other Metal Ceiling manufacturers put together.

Did we say **MORE** new designs? Yes, fully two or three times as many. We are to-day the only ones prepared to furnish complete

"BERGER'S Classik METAL CEILINGS"

in harmony with leading styles of architecture.

As a matter of course, our Metal Ceiling trade exceeds that of our competitors.

If you want information about Metal Ceilings—ask **US**—**WE** can tell you.

If you want estimates on prospective work, send sketch and measurements of spaces to be covered, and we'll submit designs and prices.

We want a chance to demonstrate that we can handle your work to your satisfaction.

Why not give us a chance?

SPECIALTIES:

Ceilings, Roofing, Siding, Eave Trough, Conductor, Hangers, Etc.

SHOWING DOVETAIL KEYS.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

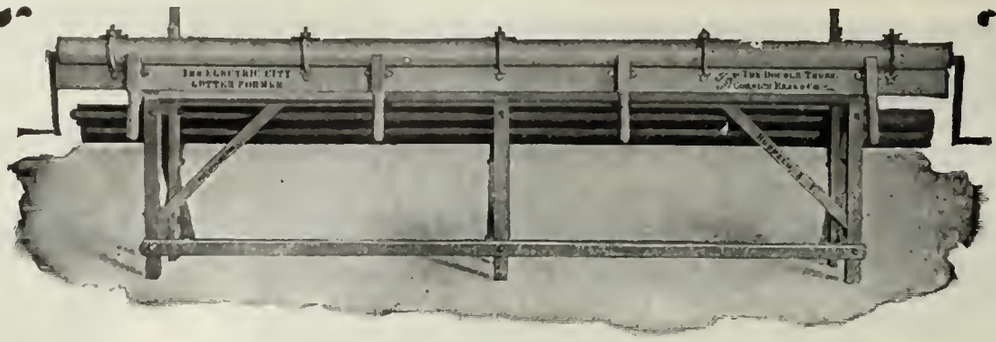
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.
This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.
The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.
Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

HARE'S FOUR LEAF CORNICE BRAKE.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, IT IS THE BEST IN THE WORLD.
96 inches long.

Our *Improved Eureka Cornice Brake.* Will bend No. 20 iron.
96 inches long.

CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 22 iron
97 inches long

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

We like to sell single ranges and furnaces, but we like better yet to sell them in bunches of six, a dozen or a hundred. Not long ago, we sent six of our Excelsior Double Oven Ranges to Mr. J. W Morrison of Holmesburg, Penna., and this is what he did with them:

"I placed six of the 806 Excelsior Portable Double Oven Ranges in the buildings known as the Annex to the Morelton Inn, at Torresdale, Penna. Every one of these ranges has given entire satisfaction."

That double oven Excelsior Range, by the way, seems to occupy a field of its own. It is uniquely good.

ROUND OAK
STANDARD of AMERICA

Here are a few lines from J. A. Eriksen, Baxter Springs, Kan.

"Kindly send me one water front for Round Oak Steel Range 8-18. This range is giving splendid satisfaction. I put it in the place of a —— range and it is baking with one-third less fuel than the —— range did."

They say testimonials do little good now-a-days, but when one comes in unsolicited, like this, we want some merchant to read it who appreciates good workmanship and who would like to sell something so good that his competitor cannot equal it. New catalogue.

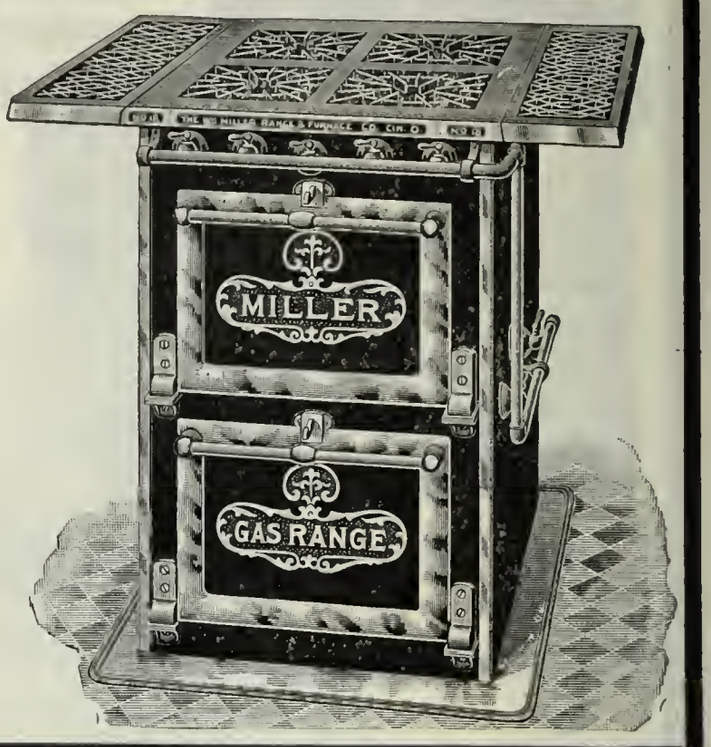
MILLER GAS RANGE

Is as economical in the consumption of gas as any Range.

The Baking is simply perfect, and cannot be excelled by any other Range.

The Broiling is grand, broiling any kind of a steak in from seven to ten minutes.



Is durable and simply constructed, so that any one can learn to run it in a few minutes.

Has *drop* doors which form shelves in front of the ovens, so that you can baste without holding the pans.

Is the handsomest Range ever built.

The *oven* can be drawn out from the front, so that if it should ever need repairing or replacing, it can be done without cutting the Range all to pieces.

The price is as low as any one can build a first-class Range for.

The only "All Steel" Gas Ranges in the Market.

The New Schill Range!

The Most Modern and Up-to-date Range Made To-day.

Possessing special and novel features not found in any other line.
It must be seen to be appreciated.

The cut shows range with flush reservoir and high closet and front or pouch feed, also draft door below pouch feed which can be opened to light fire, which is a most desirable feature Another very desirable feature is our reservoir casing, which is cast iron and front of same is covered with sheet steel, thus giving it the appearance of a steel front, saving labor in blacking. Right end of reservoir casing is handsomely ornamented. It has spring balance oven door, ventilated oven, extra large ash pan, screw draft plate, very handsomely nickeled, and is decidedly the latest in stove construction.

HENRY WATERMAN, - - 195 Lewis St., N. Y., Eastern Agent.

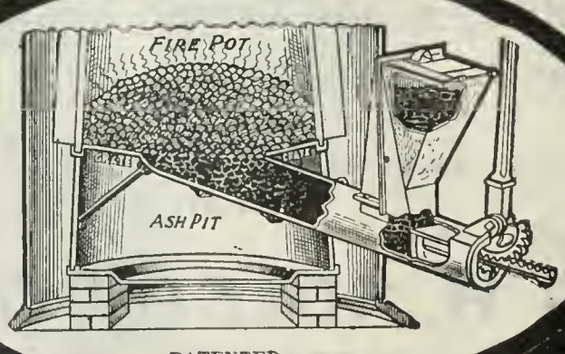
If it is any object to you to introduce an article that will win its way into about every household of your place, we suggest that you look into the

Peck=Williamson Laundry Dryer.

It will dry the clothes in 20 minutes and dry them clean and perfectly bleached. It uses the wasted heat from the laundry stove and keeps it in circulation. It gives off no odors. On its stove you can heat water, irons and do cooking.

One person may do the washing, while another follows right in her footsteps drying and ironing the clothes.

This Laundry Dryer is a wondrous labor saver. Besides it saves the clothes from destructive winds and storms. It relieves a woman from running out in the cold, exposing her health; the clothes never come in contact with soot and smoke and the like of that; the clothes last longer.



This is the Peck-Williamson Laundry Dryer in a nut-shell. All you need to bother yourself about is making the first sale. It will tell its own story to the whole town after that. It will pay for itself by what it saves. Do you suppose there is a woman under the sun who could look at this Dryer without making up her mind to have it?

Our new booklet will interest you. Free for the asking.

Our Under Feed Furnace is a new idea for making more heat at less expense. Ask us about it.

STOVE REPAIRS

Bought from us entitle the purchaser to a 1000 mile book *Free*, on any railroad.

CHAS. C. HEATH & CO., Philadelphia and Baltimore.

Write us for particulars.

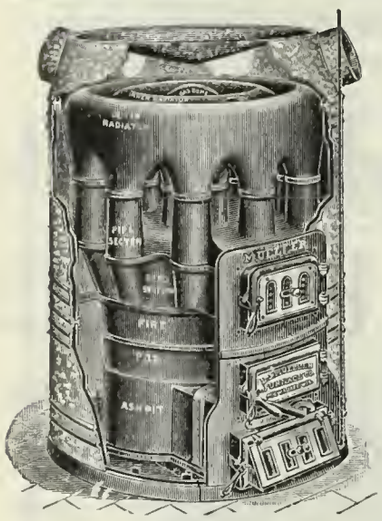
TURTLE Oil for Rheumatism is probably no better than goose oil, lard or tallow, without you've got more faith in it.

Probably you think a Knabe piano is better than a Chickering or Ivers & Pond, but if you were asked WHY, probably you couldn't tell HOW it is different.

We think the **"WINTHROP"** Hot Water Heater the best one that there is.

We've got good, sensible reasons why it is better and why we think it will do better and more economical work than others having about the same general measurements.

Our reason why the price is less is because you don't have to pay for an extensively advertised NAME.



If you'll write us for prices, we'll convince you that our prices are really very much less than other boilers of about the same capacity are sold for.

Anderson Coupling Co.

PORTLAND, CONN.

Our remarkable recent inventions enable us to offer the public an intensely brilliant, smokeless gas at much less cost than city gas, better, safer, and cheaper than electricity, and costing but one-fourth as much as acetylene. Most durable and least expensive apparatus to maintain in effective perpetual operation. Gives services of lighting, cooking, and heating, and operating pumping engines. Fullest satisfaction guaranteed, and easy terms. The very apparatus for suburban homes, institutions, etc. We construct special apparatus also for fuel gas for manufacturing, producing gas equivalent to city gas at 50 cents per 1,000 cubic feet, and made to respond to very large demands; also for lighting towns, etc. Cooking by gas rescues a person from the intolerable heat experienced with other stoves. *Send for Catalogue.*

The Kelsey Warm Air Generator.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

Ask for booklets **"KELSEY HEATING"** and **"OPINIONS."**

Statutory Ventilation and Sanitation.

Notwithstanding the benefits that have attended the use of the advanced ideas of students which have a bearing on the everyday life of the people, it has been found necessary in many instances to secure the observance of such beneficial customs by the enactment of special laws for the purpose. At the present day the benefits that accrue from the proper ventilation and sanitation of buildings are broadly recognized, yet it has been found necessary, particularly in the case of schools and public buildings, to provide laws which will compel the provision of ventilating and sanitary facilities in the construction of buildings of this class. Such a law has been on the statute books of the State of Massachusetts for a number of years, and for the past two or three years efforts have been made to secure the enactment of a similar law by the Legislature of New York State. The measures presented have only failed of enactment through the rush of business at the close of the legislative sessions, after having been passed by one body, and favorably reported for final action in the other. The heating and plumbing trade are now invited to lend their assistance in securing the passage of the bill which has been introduced this year by Representative Woody of Brooklyn. This aid can be most effectually given by correspondence with their Assemblymen and Senators, requesting them to study the provisions of the bill and urging the matter on their favorable consideration. The present bill is largely the result of the study and labor of C. B. J. Snyder, architect, and superintendent of the School Building Committee of the City of New York. Mr. Snyder is also a member of the Board of Governors of the American Society of Heating and Ventilating Engineers, and he is co-operating with the Legislative Committee of that society, which has been active in working for such a law for several years. The full text of the bill will be found on another page, where its provisions can be studied. In addition to securing the proper ventilation of buildings, the measure, as presented this year, also includes some very necessary sanitary provisions. Another important feature is the provision for protection against fire.

Bills of a similar character have been before the legislatures of New Jersey, Maryland, Pennsylvania and some of the Western States, but as yet have failed of enactment through lack of interest. There is a necessity for missionary work by the trade in this matter, because of the lack of familiarity on the part of the average legislator with the necessity for such legislation in the interests of the general public. No more effective assistance can be rendered to those who are now engaged upon such work than to explain the object and the result to legislators in detail. Without full knowledge on these points, the legislator is apt to consider bills of this character as of minor importance. It has been the experience both in New York and Pennsylvania that such laws fail of enactment simply because other laws are more persistently pushed, and occupy the calendar to the exclusion of the ventilation and sanitation laws. This condition of affairs can be entirely changed in the present case by so simple a method as correspondence with Assemblymen and Senators, urging their consideration of the bills now before the Legislature, or, better still, by personal interviews with the legislators, where this is possible.

Building Activity.

The spring season opens with evidence of an unusual volume of building operations under way or in preparation in all parts of the country. There is every indication of a year of pronounced prosperity for the various trades that cater to or are affiliated with this important industry, including those branches of business to which the majority of our readers belong. While the building record of 1901 was exceptionally good, builders, architects and others directly interested freely predict that 1902 will far surpass its predecessor in the amount and value of its building operations. The fact that prices of some materials are lower than they were a year ago, when a number of building plans were postponed because of their expense, while about all other materials are at least no higher in cost—iron and steel products being about the only building materials that have advanced in the past twelve months—will doubtless stimulate the undertaking of deferred building projects in many instances. A marked feature of the present year's construction is the great number of large structures that are being erected or are under contract in the business centers of the country. Especially is this the case in New York, where a great crop of many storied office and loft buildings, hotels, high class apartment houses and other costly structures is springing up all over the city. These buildings largely take the place of older ones that have been torn down to make way for the more modern constructions. Last year, according to a recent report of the city's Building Commissioner, the aggregate cost of building operations projected in the boroughs of Manhattan and the Bronx was $112,000,000, or nearly double that of the previous year. This amount was made up mainly by large buildings of the class referred to. No less than ten huge business skyscrapers will be completed about May 1 in the small area on Manhattan Island that lies below Fulton street, and as many, or more, are projected or already begun in the same district, which will be completed in the course of the present year. These figures give some idea of the active condition of the building industry in one small section of the metropolis, and this activity is already reflected in other parts of the city and, in a greater or lesser degree, in all the cities and towns of this country, so that the claim made that 1902 will be a "boom" year in the building business seems to have a substantial foundation.

Peddling Ranges.

That particular form of enterprise adopted by some stove manufacturers, which consists in peddling ranges in order to dispose of their surplus product, is not at all appreciated by dealers who maintain an establishment for the sale of stoves. With the approach of spring comes the information that carloads of steel ranges have been received at some of the Western centers, and that already a number of salesmen and teams have been engaged to canvass the small towns and farmers in the vicinity with the object of disposing of the goods. There can be no doubt that the stove dealer who aids in the general distribution and sale of stoves by furnishing to all who visit his establishment more or less information free, as well as an opportunity to examine the stoves, is entitled to substantial protection at the hands of the stove manufacturing trade. A very general feeling exists that those who manufacture should confine themselves to manufacturing and leave the retailing to the retail dealers, and it is probable that the objection raised to the manufacturers who peddle stoves is due to the prevalence of this idea. It is not improbable that self interest rather than enterprise prompts some houses to take up peddling in order to dispose of their product. Still, there is another side to the peddling question. Beyond question the retail trade have received substantial protection for years, and have grown to look upon it as a natural right. In too many instances, however, they have not felt it incumbent upon them to make special efforts to familiarize themselves with new goods and to keep abreast of the enterprise of the manufacturers who bring out new goods with the object of introducing such goods to the attention of their community. This means live, up to date stove selling, and stove dealers of this alert type seldom have their territory encroached upon by the peddlers. Such energetic merchants have no difficulty in receiving substantial assistance from the manufacturers in the shape of advertising matter adapted for attracting the attention of possible purchasers. Even as "eternal vigilance is the price of liberty," so eternal energy and enterprise is the price of enjoying the undivided profits of a large territory.

Water Wasted and Stolen.

For some years past it has been notorious that the water supply of the city of New York was grievously wasted and the municipal revenues curtailed by reason of defective meters, leaky pipes and mains and like causes. It seems, however, that this is not the worst part of the abuse, for the claim is now publicly made by the Merchants' Association that the city has been put to immense loss through water consumed and not paid for. In short, that it has been systematically robbed by collusion between consumers and officials. In a bulletin issued by the association some startling revelations are presented which would justify the impeachment of the former administration of the city. The verdict of the association is that "the city's water is not wasted; it is stolen." While the charge is based upon careful investigation and full information it would probably bear amendment, so far as the denial of wastage is concerned, for the evidence is convincing as to the large number of defective water meters found throughout the city by the present administration after taking charge of the city's affairs. Leaky faucets, leaky pipes and broken mains have also been discovered in many parts which have aided in the criminal waste of water. The indictment, however, in regard to the theft of water is significant. The meters, which are designed to prevent the waste of water, seem actually to have been used for the purpose of covering up fraud. The investigations of the Merchants' Association disclosed the fact that meters have been extensively manipulated or mutilated so as to make them record falsely, a fraud which, it is plain, could not have been carried out successfully for a term of years, unless winked at by the employees of the Water Department.

Commissioner J. Hampden Dougherty, the present head of the Water Bureau, has found a number of meters which by deft manipulation have been made to register only about one-tenth of the water that passes through them. As there are some 37,000 water meters in use in New York City, and the extent of the tampering with the same is believed to be very widespread, it is not surprising that those acquainted with the facts are claiming that the water revenues of the city for the past few years have been from $2,000,000 to $3,000,000 a year less than they should have been if the water supply business had been honestly conducted. In addition to tampering with the water meters the Merchants' Association claim that frauds upon the city have been perpetrated by false reports by inspectors of the actual quantity of water registered by meters, by false entries of quantities upon the books of the water register, and by secret service pipes or by-passes, which divert a large portion of the water actually used, so that it does not pass through the meters. Everything that has been disclosed in connection with this matter emphasizes the fact that the system of water supply and registration in New York City needs to be thoroughly renovated all the way through, and protected from both careless waste and wanton fraud. The water meter system was originally inaugurated under the Tweed *régime*, and the claim is made that it was deliberately put in with the idea of defrauding the city and providing a lucrative revenue to dishonest officials. Should the present city administration succeed in correcting this abuse it will earn the thanks of the community, and also add considerably to the city's revenue.

Mr. Swank's figures of the production of Bessemer steel ingots for the year 1901 are startling in their magnitude, showing as they do an increase from the banner year 1899 of 1,126,948 gross tons, while the increase over 1900 was 2,028,532 gross tons. To the 8,713,302 tons of Bessemer steel made in 1901 must be added the output of open hearth steel, for which the American Iron & Steel Association has not yet published the figures. In 1900 the production was 3,398,135 gross tons. It would be surprising if the two together for 1901 did not reach 12,500,000 gross tons—a stupendous total.

THE IRON SHORTAGE.

Stray consumers of foundry iron are feeling the scarcity of metal quite keenly, and are forced to pay several dollars per ton premium for what they must have immediately. But of the whole tonnage which goes into the cupola, the converter and the open hearth furnace this is an almost infinitesimal percentage, the great mass of iron which is being melted being delivered on old contracts at fair rates. The same is true of steel. In times like these perspective is distorted, and much is made of what are comparatively trivial circumstances. It would, of course, be rash to deny their significance, which is that our home consumption is enormous, and that it slightly outbalances production. The balance would quickly swing in the other direction, however, if consumers got it into their heads that prices are abnormally high. While they are remunerative they are not unreasonable, nor is it likely that the shortage now so keenly felt will last more than 60 or 90 days.—*The Iron Age.*

The Furnace Work Record.

ITS USE AND RECEPTION.

Those who take an active interest in the advancement of furnace heating and who favor more scientific methods in the designing of furnace work will be pleased with the reception given to the furnace work record presented in *The Metal Worker* of March 8. It has been known to us that there were men in various sections of the country who, by a close study of their furnace work and methods, were enabled to make a success of every furnace heating plant installed under their supervision. It was also known that these men were eager to compare their experience with that of others, but for obvious reasons the opportunity to do this in person had not presented itself. The nearest approach to it was when the subject of furnace heating occupied so much time in the discussions at the annual meeting of the American Society of Heating and Ventilating Engineers in New York this winter.

The chart presented in *The Metal Worker* was designed purely as a suggestion, and it was expected that it would evoke comment both of a favorable and unfavorable nature. We are not surprised that there are many furnacemen who are willing to let well enough alone, and who seem unwilling to make any effort or take any trouble in devising rules or aiding in the preparation of data that will be of benefit to the whole trade. To those, however, who have shown a progressive spirit we extend our congratulations, and to those who are somewhat skeptical we offer encouragement, with the conviction that the furnace work record will benefit many in the trade, even if the good may not be enjoyed directly by all who are engaged in furnace work. Some correspondents have already made suggestions for changes in the record, others suggest supplemental charts, and a few have been good enough to return the charts sent to them with a tabulation of some of their work, which will be presented in an early issue. This evidence that there are some who are willing to go to the trouble of filling in the charts sustains our opinion that it was worthy of presentation. We still have a limited number of enlarged charts which we can furnish to those who desire to make use of them.

FAVORABLE COMMENTS.

With the usual custom of favoring those who agree with our views, we present the most favorable opinions first. At the same time we believe that benefit can always be derived from reading the other side of the question. The less enthusiastic views follow, so that whatever may be said on either side of the question may be duly considered by those most interested:

PROF. J. H. KINEALY, WASHINGTON UNIVERSITY, ST. LOUIS:

> I have received a copy of your record of furnace work and congratulate you most heartily upon the completeness of this record. I feel that you have made a step in the right direction toward getting valuable data for furnace work. Furnace work has not had the right kind of attention given to it, and yet it is one of the most important works in connection with heating. Furnace work has gotten rather a "black eye," because furnaces have been installed with so little regard to the work which they will be called upon to do, and with so much regard to skimping and cutting down the cost of installation; the result is that furnace work has come to be looked upon as the cheapest and worst kind of heating work. I cannot see any justification of this, and I therefore am very much pleased to see what you are doing to put furnace work upon a proper footing, and to have it occupy its proper and legitimate place in the work of heating and ventilating buildings.

PROF. R. C. CARPENTER, SIBLEY COLLEGE, CORNELL UNIVERSITY, ITHACA, N. Y.:

> I am much pleased with the idea presented by your blank for furnace work. I inclose it filled out for one job. If you will kindly send me one or two additional blanks I will try and get some more information. The blank is, in my opinion, neatly worked out, and I hope you will succeed in getting enough reports to work up some general laws as to furnace practice.

MARTIN L. KAISER, WILKES-BARRE, PA.:

> Yours of the 8th inst. with blank furnace record received. I have not been able to give the matter much thought, but think the idea very good. The plan has been pretty carefully worked out, but I will offer a few suggestions any way. I think the explanation of E. G. S. rather ambiguous and would substitute, "the E. G. S. equals the glass surface plus one-quarter the wall surface." An extra wide column for general remarks would be an improvement, I think. Perhaps the first column could be widened for the purpose. Next to the column for size and area of fresh air supply I would place a column for area of air passages in the furnace. If it is good for nothing else it would at least call attention to an important item often neglected.
>
> According to excellent authority 12 square feet of floor over unheated basement is equal in cooling power to 1 square foot of glass, and 10 square feet of ceiling under an unheated attic is equal to 1 square foot of glass. The proportion of such cooling surface is much greater in a two-story building than in a four-story building. If this surface is taken account of and added to the glass surface the blank ought to be of much value in planning sizes and capacities of apparatus. A few clear cut, simple rules for determining the grate area, stack area, heating surface, &c., for different classes of buildings, based on the E. G. S., might be of use in planning new work. Whether these suggestions are of any value to you I do not know, but I gladly accept your kind offer to send a few additional blanks, either amended or in their present form. I can see that too much elaboration will make the blanks so bulky as to be unwieldy. If the blanks could be largely introduced many furnacemen would learn much of importance.

MARTIN FISHER, BUFFALO, N. Y.:

> We commend your enterprise in gathering information of this character, which cannot but prove beneficial to the trade at large. We have heated a very large number of fine dwelling houses in this vicinity with the best of success, and will be pleased at some near future time to contribute some of the knowledge so gained.

GEORGE J. PALMER, WEST CHESTER, PA.:

> I have never kept a record of furnace work such as you suggest, but would consider a table containing data of this kind very valuable to furnacemen. Some of this data, such as "heating surface," would necessarily come from a manufacturer of furnaces. The balance would require careful measurements on the part of the furnaceman.

EISENBISE & BROTHER, CHESTER, PA.:

> We approve of the general idea, as referred to in *The Metal Worker*, but unfortunately we have never kept any record of heating systems we have installed, and we have not time to go over them.

E. B. MESSER & SON, HARTLEY, IOWA:

> We do not do much hot air work, ours being almost entirely water and steam. It has been two years since we put in a hot air job, but we think that one somewhat similar would be of service for air, water and steam. We would fill out your blank if we had preserved the figures, but we did not.

W. J. WOODALL, CONNELLSVILLE, PA.:

> In our opinion such a table as you propose would be a benefit. It would be made use of by a great many furnacemen, and we think would be an aid in better proportioning the whole furnace system and in that way help all who are engaged in the business. We would advise the addition of a note such as "Increase grate and radiating surface, say 25 per cent., for every 12 degrees below zero." We wish you every success in your effort to better this important branch, which so many of us have at heart.

GIBLIN & CO., UTICA, N. Y.:

> We think the blank prepared is a good one, and great benefit would accrue to the furnace trade, both manufacturers and dealers, by the use of this blank and making comparisons of the working of the same furnaces under different conditions. We would suggest that, in addition to the heading given, the following would be of benefit:
>
> 1. Street and number of building.
> 2. Diameter of furnace fire pot.
> 3. Diameter of furnace casing.
> 4. Days furnace was in use.
> 5. Lowest temperature during the season.
> 6. Average temperature while in use.
> 7. Velocity of air in registers.

CHARTER OAK STOVE & RANGE COMPANY, ST. LOUIS, MO.:

We would suggest, if not too cumbersome, have more room left for information concerning fuel, flue and draft in flue, and for hot and cold air pipes—express in fractions of an inch of water.

LENNOX MFG. COMPANY, MARSHALLTOWN, IOWA:

We consider the blank for keeping record of furnace work of value and think that the form that you have is quite complete. There is one thing that we do not notice on the blank that is of vital importance where outside cold air is used, and that is the size and nature of the ventilating flue. We use outside cold air connections in this country but very little, if any, and in fact do not understand the advantage of using the outside air without the use of a ventilating flue. We can conceive of no way that this will increase the circulation of the air within the building, and this certainly is an important thing, and the thing that the success of the hot air furnace depends upon. The circulation can be obtained in two ways: One by the use of a ventilating flue to remove the air off the floor of the building and supply the furnace with cold air from the outside, and the other by a return system, which consists of supplying the furnace from the cold air on the floor of the building. With this system we know nothing of the experience that is very common where outside air is used, without sufficient ventilating flue—namely, that of the house being heated on one side one day and on the other side the next day. With a good circulation of air, which can be obtained by placing a cold air face in the floor or baseboard of each room, this never occurs.

COOK & VAN EVERA COMPANY, CHICAGO, ILL:

We thank you for asking our opinion and idea in regard to detail furnace work, but we are not manufacturers and could not give the many inquiries you outline in your blank the proper attention. All the furnace manufacturers and jobbers are deriving great benefits from the detailed descriptions and information contained in *The Metal Worker*, as they are becoming better educated on furnace work and are more prepared to install furnaces in such a manner that the operation of the same will be satisfactory to the consumer. We cannot understand why any retail furnace or hardware man should neglect to subscribe for your valuable paper and be at all times posted and familiar with the work they may be called upon to do in their own line—the furnace business.

CHARLES C HEATH & CO., BALTIMORE, MD.:

The blank for keeping a record of furnace work is very good indeed. We have not the time just now to go into this in detail, but it possibly could be improved in some ways, and yet from a glance at it we think it is excellent as it is.

THE PRIZER-PAINTER STOVE & HEATER COMPANY, READING, PA.:

The blank for use of furnacemen is very complete and should be appreciated by all furnace dealers. We have no suggestions to offer, as it is about as complete as it could be made, but we will give you the names of a few furnacemen who might be glad to comment upon the situation.

THE SCHILL BROTHERS COMPANY, CRESTLINE, OHIO:

The Metal Worker record of furnace work is certainly very complete, and we see nothing that we could suggest in the way of improvements on same.

THE NATIONAL PIPE BENDING COMPANY, NEW HAVEN, CONN.:

We think the idea would be all right if anybody will take the trouble to carry out the specifications referred to, but we are afraid that very few people will go to that trouble.

H. ADLER COMPANY, PITTSBURGH, PA.:

As we are not directly in the hot air heating business we are not able to suggest improvement in your record of furnace work, although we believe a record of this kind would be a splendid thing.

PITTSBURGH STOVE & RANGE COMPANY, PITTSBURGH, PA.:

After examination we consider the record would be of value to a retailer in the furnace business, making a very complete and accurate record of the various contracts complete which would be of great benefit to him.

ABRAM COX STOVE COMPANY, PHILADELPHIA, PA.:

We would say that the blank for record of furnace work is a very good thing, and possibly to add anything to it might make it too complicated.

FLOYD, WELLS & CO., ROYERSFORD, PA.:

We cannot suggest anything of advantage, as we believe you are better fitted in your office for that than we are.

CLARENCE M. LYMAN, UTICA, N. Y.:

The blank for record of furnace work is deserving of careful study and consideration. The idea presented is a good one, and in the hands of careful investigators would prove of great value, provided all the data could be obtained, but here is where one difficulty will be encountered, I fear. Manufacturers who can or will furnish the heating surface of their product are few and far between, and the average contractor has not the time, and will not make the effort, that is necessary for him to be able to measure the surface for himself. Again, the item of coal burned for a season is an extremely difficult one to obtain, in spite of the glowing testimonials that are published to exploit different heaters. It is only here and there that there is a man in the furnace business who can readily figure out the details in most of the remaining columns. I speak feelingly on the point, for in spite of all the constant repetition in good furnace makers' catalogues that the cold air supply must equal two-thirds or three-quarters of the area in the hot air pipes in cross sections, I am constantly appealed to for information as to how large a cold air duct there must be for this or that job. If furnacemen are at sea on such little matters, I am afraid they will hopelessly flounder on glass area, equivalent glass surface and proportions. I wish I could fill out the blank as requested, but as I have no record and my work consists largely in giving aid to others I seldom hear of a job after it is installed, unless it fails to give satisfaction. I hope, however, that other furnacemen may be more fortunate and that these records will be kept and filled out, that we all may have the benefits of them by having them sent to *The Metal Worker* for publication for the general good of the trade later on.

Many houses, without comment, have sent names of furnacemen to whom they desired the blanks to be sent.

LESS ENTHUSIASTIC VIEWS.

Inasmuch as it might prove embarrassing to some, who from their comments on the furnace work record certainly cannot be considered enthusiastically in its favor, we have withheld their addresses in connection with the comments which they have made.

A Western furnace manufacturer writes:

In reference to the furnace record blank I, for one, would not advise printing them, they not being practical. It would take too much work to figure out the data necessary to fill the blanks. The conditions never come alike, and the results obtained in one job are not certain in a second. The operation of the furnace must be taken into consideration. A person competent to figure on work does not especially care for the results obtained by another, and if his own is a failure the knowledge obtained through the record would be too indefinite to help him out. I regret that I cannot write more encouragingly.

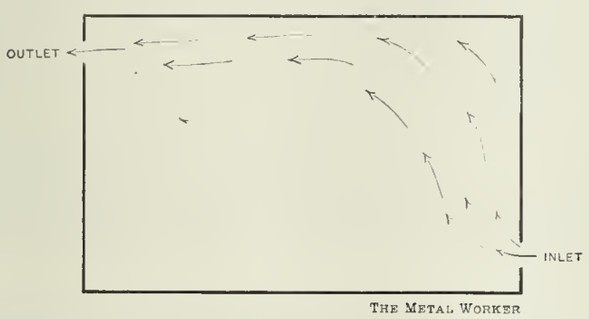
An Eastern manufacturer writes:

After due consideration of your blank on record of furnace work, we are afraid that there is too much to this blank to interest the average man who does furnace work, and question if it would be popular with this class of men.

A Western house write:

Concerning the record or reference sheet, we would say that it may be all right, but life has been too short for us up to the present time, and it will be henceforth, to bother with a thing of this kind. We have not gone very far into details, but it seems to us that furnacemen, if they are doing any furnace work of consequence, would hardly have the time to keep a record of this kind.

An old furnace manufacturing house write:



We have examined the furnace record blank very carefully and think such a record would be of considerable interest to many furnace concerns, but we cannot see that it would be of any great value, as in the majority of furnace jobs the conditions are very simple and require no such elaborate calculations. Furnace work, for the most part, is not an

exact science and does not require such fine mathematical calculations as the form indicates. At least nine out of ten furnace dealers could not fill out one of these blanks if they should try for a week. We therefore do not think this blank form would really be of any great practical value. It certainly would not be to us, and for that reason we doubt if it would be to many others. We take it for granted that you wish us to give you a frank statement of our views, and have done so.

AN EASTERN COMMENT ON THE ROTARY SYSTEM.

BY R. R. M. C.

In *The Metal Worker* of March 8 there appeared an article by "Iowa" on furnace heating. While there were a great many good points in this article, I beg to differ with him on a couple of his statements. First, he

An Eastern Comment on the Rotary System.—Fig. 1.—Showing Air Movement Due to Location of Registers.

speaks of "the old idea of taking cold or fresh air from out of doors?" Where, pray, would we go for fresh air if we did not go out of doors for it? Take a school room, for instance, occupied by 50 pupils, heated by the warm air "rotary" system, as explained in the above

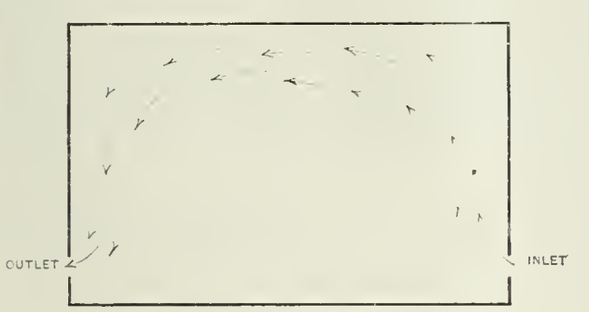


Fig. 2.—Air Movement with Different Location of Registers.

mentioned article. Say, for instance, in the morning, when the pupils first assemble in the room, the registers are all opened to admit heat. In R. C. Carpenter's book on "Heating and Ventilating," the allotted time for contaminating the air in a school room, where each child is

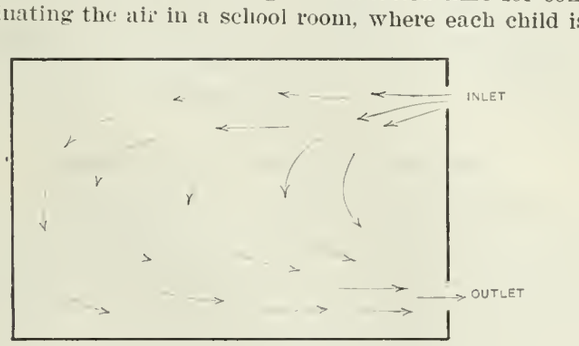

Fig. 3.—Diffusion of Air through Best Location of Registers.

allowed 130 cubic feet of space, is eight minutes—that is to say, in eight minutes after the children enter the room the air is contaminated.

Now, according to "Iowa's" idea, this contaminated air is passed through the return ducts down to the furnace to be heated, and again passed into the room to be breathed over by the 50 pupils. By noon, allowing three hours of school to the morning session, this same air will be breathed over about 22 times. No; I think if Mr. "Iowa" were to introduce his rotary system of furnace heating into an Eastern school building he would meet some reverses.

Again, Mr. "Iowa" speaks of the placing of ventilating registers near the floor as a wrong idea, and says that the theory that carbonic acid gas is heavier than air is incorrect. In the first place, if he will look up the matter he will find that a given bulk of carbonic acid gas at 62 degrees weighs 0.11631 pound, and air at the same temperature weighs 0.0761 pound. When the carbonic acid gas breathed from the lungs mingles with the air it, being heavier, will most assuredly fall to the floor.

Again, if the ventilating register is placed near the ceiling on the opposite side of the room the movement of the air current will be that shown in Fig. 1, none of the incoming air reaching the lower part of the room. If the outlet is placed at the bottom of the opposite side of the room the movement will be as shown in Fig. 2, the incoming air again missing the lower portion of the room, except where the air enters and leaves the room. Now if the register through which the air enters is placed about 8 feet above the floor and the ventilating register at the floor on the same side of the room the children sitting near the register will suffer no unpleasant effects from the incoming air, and the perfect circulation will take place as shown in Fig. 3.

"Iowa's" idea of rotating the air is certainly an excellent one, and one we use right along, but a large amount of fresh air from out of doors is also a great necessity.

The American Stove, Range & Foundry Company.

The Memphis, Tenn., parties who bought in the South Pittsburg Stove & Foundry Company's plant at South Pittsburg, Tenn., when it was sold by auction last month, are pushing repairs on the plant rapidly, preparatory to starting work on April 1. The proprietors have incorporated under the name of the American Stove, Range & Foundry Company, with C. C. Huntington of Memphis as president, T. G. Garrett of South Pittsburg as vice-president, and John J. Bowers, secretary and treasurer. The company are capitalized at $120,000. The plant has a capacity of 40,000 stoves per annum, and foundry room for 150 floors. It originally cost, when built by the Perry interests of Sing Sing, N. Y., $250,000. The new owners claim that they will run it to its full capacity. A cast iron soil pipe plant was a part of the old foundry, and this will also be operated at an early date. When in full working order about 300 hands will be employed.

The Wireton Heating Company.

A new location has been selected by the Wireton Heating Company, manufacturers of furnaces and other house heating apparatus, time draft regulators, &c., whose plant, at Blue Island, Ill., was burned last month. The company have purchased 5 acres lying between the works of the Baldwin Piano Company and the Sheldon-Foster Glass Company, at Chicago Heights, Ill. The railroad facilities of this location are highly advantageous, as the section is traversed by five separate lines of railroad, including belt lines, which connect with all railroads running out of Chicago. The company will build a plant which will greatly exceed the capacity of their old works. They have decided to erect five buildings, consisting of a foundry, 80 x 150 feet; machine and tin shop, two stories high, 50 x 250 feet; pattern shop, two stories high, 50 x 80 feet; boiler and engine house, 50 x 80 feet, and warehouses, 100 x 200 feet. These structures will be of brick, stone and mill construction. They will be equipped with the most improved modern machinery. The company hope to have their plant ready for manufacturing operations by July 1. They had operated their plant at Blue Island for over 12 years, and had built up a large business, which they confidently expect to greatly increase at their new location. M. Austin is president of the company, E. A. Billings is vice-president, A. C. Cattrell is treasurer and E. H. Heald is secretary and manager.

Jewel Gas Stoves.

The 60-page catalogue of Jewel gas stoves which has just been issued from the press by George M. Clark & Co. of Chicago, Ill., is in its general style and make up similar to the one noticed in these columns a short time ago, covering the manufacturers' line of gasoline goods. The typographical make up is a good example of the printer's art, and the binding is in covers of unique design. The Jewel gas ranges are shown in great variety and adapted to meet requirements both large and small. Such descriptive particulars are given as to render the construction readily understood, and the matter is presented in such shape as to be of the most value to the dealer, as well as of interest to the prospective user of gas stoves. Attention is given to the Jewel gas circulating water heater, showing how it may be utilized for hot water for the kitchen or laundry, as well as for the bath; the Jewel hot plates, broiling stoves, tailors' iron heaters, laundry stoves, baking ovens, gas tubing, burners and other fixtures. Some suggestions are given relative to repairs for Jewel goods, and a comprehensive index is a concluding feature of convenience.

ODD PLATES.

The Alganite Stove Company of St. Louis, Mo., have been incorporated with a capital stock of $5000. John R. Wettstein, Charles R. Fife, and John P. Nevill are the incorporators.

The regular monthly meeting of the Stove Dealers' Association of Washington, D. C., was held last week, when the question of a new agreement with the wholesale dealers was discussed without definite action. A committee consisting of Messrs. Pierpont, Mathy, Doyle, Sauer, Dodson, March and Hammond were appointed to arrange for the annual banquet of the association, to be held on April 2.

Max Schultze, who has been in the hardware business at San Antonio, Texas, for many years, is reported as being associated with a number of capitalists of Milwaukee, Wis., for the purpose of establishing a Stove foundry at Monterey, Mexico. The demand for Stoves is said to be constantly increasing in Mexico, and it is believed that favorable conditions exist for their manufacture in that country.

The Progress Furnace & Stove Company, Springfield, Ohio, are contemplating the erection of an addition to their plant.

W. H. Colebrook, Sons & Co. of Syracuse, N. Y., marked the advent of St. Patrick's Day by the distribution of a card in which was fixed a neat shamrock button hole, with the legend, "We want to button hole you and land that Cement order," referring, of course, to Colebrook's Asbestos Furnace Cement.

The Art Stove Company of Detroit and Chicago announce to their friends in the Northwest that they are showing a full line of samples of Laurel Stoves and Ranges, at 300 and 302 Third avenue, North, Minneapolis, Minn., where they also carry a large stock of these goods. The branch is under the management of William H. Kirk, who will take pleasure in showing the improved and desirable line that the company are offering for 1902.

The Enterprise Foundry Company, Bristol, Tenn., manufacturers of Stoves and Hollow Ware, desire to receive catalogues of Stove Supplies. In addition to their manufacturing business the company are prepared to repair all kinds of machinery.

Charles Koll, for many years past connected with the Victor Stove Company of Salem, Ohio, has been appointed manager of the Enterprise Stove Company of Vincennes, Ind. Mr. Koll, who assumes his duties at once, brings to this new position an experience extending over many years in the Stove manufacturing business.

The S. M. Howes Company, manufacturers of and manufacturers' agents for Stoves, Ranges, Furnaces, Refrigerators, Fire Place Fixtures, &c., have recently greatly improved the appearance of their stores at 40, 42, 44 and 46 Union street, Boston, Mass. The ground floor store has been redecorated and the stock arranged in an attractive manner. The offices of the managers are on the second floor, and have been changed about with a view to facilitating the transaction of the growing business of the concern.

The Pittsburgh Stove & Range Company, Pittsburgh, Pa., will ask for an amendment to their charter, to permit the sale of property. This step is being taken in order to further the company's plans for the concentration of their plants at Beaver Falls, Pa. A number of the foundries taken over by the consolidation have been dismantled, and it is believed that by the concentration of their forces many economies of management and manufacture heretofore impossible would be secured. The majority of the Stove plants purchased by the company are old fashioned and some of them badly located, consequently their operation was in many cases found unprofitable.

Under date of March 15, F. M. Borden & Co., 118 North Second street, Philadelphia, send to the trade an announcement that their salesmen will soon call in the interest of Gas Ranges, Gas Hot Plates, and other summer goods. Special attention is directed to the Big Four Gas Ranges, and the Ideal and New Process, with ovens and broilers.

A Torrid Sunshine Hot Air Furnace, made by Orr, Painter & Co., Reading, Pa., painted a vivid green, adorns one of the corners at Beekman and Pearl streets, New York City.

M. Travilla of Quincy, Ill., is distributing among his friends in the trade a little pamphlet of pocket size, illustrating and describing the Rattler Air Tight Heater, which he manufactures in several sizes. The Stove is made with polished steel body, lined with heavy steel. A heavy iron brace across the top prevents buckling of the drum from heat, while a check draft on top prevents puffing. Accompanying the illustrations are tables showing the sizes in which the Stove is made, its hight, width, shipping weight and net price. The Rattler Oak is also shown, designed for using coal or wood.

The Doyle Air Burner Company are building a factory at Joliet, Ill., for the manufacture of Stoves on the Doyle air burning principle. Steps are also being taken to establish a factory at La Crosse, Wis., for the same purpose.

The Liberty Stove Company of Philadelphia, Pa., have been incorporated with a capital stock of $100,000 for the purpose of manufacturing Stoves and Furnaces.

The American Stove Company of Jersey City, recently incorporated under New Jersey laws with a capital of $5,000,000, have been incorporated in Illinois with a capital of $250,000.

The Chattanooga Stove Company, Chattanooga, Tenn., are about to erect an addition to their plant in the shape of a four-story building, 50 x 150 feet.

American Hardware Corporation.

The details have been completed by which the interests of the great hardware manufacturing concerns of P. & F. Corbin and Russell & Erwin Mfg. Company, New Britain, Conn., have been merged into the American Hardware Corporation. These details were formally completed at a meeting of the directors of the constituent companies, held in New Britain, at the office of P. & F. Corbin on the 13th inst. The following are the board of directors of the new corporation: Hon. Phillip Corbin, Andrew Corbin, Charles M. Jarvis, Charles H. Parsons, Charles Glover, George J. Laighton, Andrew J. Sloper, Howard S. Hart, William G. Smythe.

The Board of Directors chose the following officers:

President, Hon. Philip Corbin.
First Vice-President, Charles M. Jarvis.
Second Vice-President, George J. Laighton.
Treasurer, A. J. Sloper.
Assistant Treasurer, Charles E. Wetmore.
Secretary, Theodore E. Smith.

Pennsylvania Retail Hardware Dealers' Association.

Under date of March 12 the following circular relating to the meeting next week of the Pennsylvania Retail Hardware Dealers' Association has been issued:

The Pennsylvania Retail Hardware Dealers' Association will meet at the Monongahela House, Pittsburgh, March 26 and 27.

You are cordially invited to attend these meetings, and if you are not already a member we hope that it is not because you think such organizations are unnecessary.

The truth must be forced upon us that there is only one force mighty enough to cope with the powerful influences that are operating to undo us, and that is the combined forces of the retail dealers of the country.

It is useless for the few to make their protests against these evils. We must plan as great conquests are planned, and unite, as by co-operation only great victories are achieved.

We need your help. Will you be present at these meetings?

Please reply promptly on the inclosed postal card, as the Committee on Entertainment desires to complete its work.

J. F. FRYE, Secretary.

J. E. DEGBY, H. F. ROBINSON, G. F. RUDOLPH, Programme Committee.

This circular is being sent to all retail hardware merchants in the State whose names the association has been able to secure. If any are missed it is not by design, as the officers desire, if it were possible, to have every Hardware retailer in the State at the meeting, or at any rate a member of the association. Arrangements have been completed by which it is expected a very interesting and profitable meeting will result, with, it is hoped, a large accession to the membership. Any further information desired in regard to the gathering may be obtained from the secretary, J. F. Frye, Charleroi, Pa.

California State Retail Hardware Association.

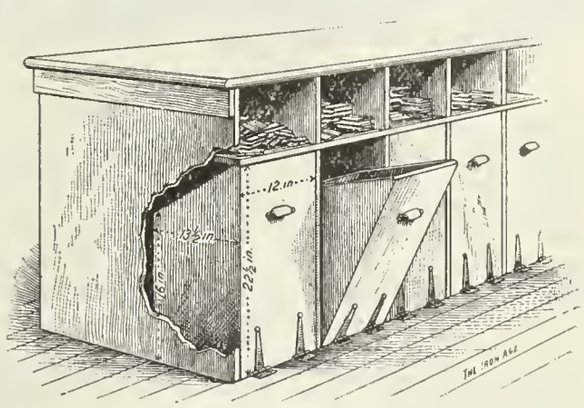
The first annual meeting of the California State Retail Hardware Association was held in San Francisco on March 10 and 11. Delegates representing the five local associations of the State were present. Mayor Schmitz of San Francisco welcomed the dealers to that city. The following officers were elected for the ensuing year: President, O. F. Sites, San Francisco; vice-president, A. F. Gutman, Germantown; secretary, Henry Gracey, San Francisco; treasurer, H. C. Bennett, San Francisco. Executive Committee: C. W. Bennett, Fresno; Mr. Turner, Modesto; E. A. Eaton, Salinas; J. W. Baxter, Watsonville; W. L. Lutz, Santa Ana; E. C. Dawe, Santa Barbara; John C. White, Marysville; A. L. Nichols, Chico; S. Armstrong, San Francisco, and M. Brown, San Francisco.

The State organization comprises the following associations: The San Francisco and Oakland Retail Hardware Dealers' Association, the Pacific Retail Hardware Dealers' Association, the Central Retail Hardware Dealers' Association and the Southern Implement and Hardware Dealers' Association.

On the second day of the session conferences were held with the Pacific Coast Hardware and Metal Association, the jobbers' organization. The results have not been made public, but it is given out that arrangements were made by which the friction between the retailers and the jobbers will be largely removed.

ENAMELED WARE IN ENGLAND.

A spirited controversy is now taking place in England as to the advantages of good enameled ware and the delcterious effects of inferior qualities. In this connection our London correspondent writes:



"The Cannon Iron Foundries, Limited, state that, besides the risk arising from enamel lined articles of unsatisfactory quality, there is another prolific source of food contamination in the use of cooking utensils, such as common fry pans and tea kettles, which are manufactured in enormous quantities, lined with an alloy of tin and lead, but with the latter to a very large extent predominating. This is, of course, a very serious statement to make, but the company sign their own name to it. It must be remembered also that large quantities of enameled ware are sold to the public institutions of this country. A friend of mine, who has been in this trade for 20 years, has been good enough to write me something of his experience. He says:

"'The ironmonger who stocks the cheap, badly glazed enameled ware runs a grave risk, and on no account when tendering to a public institution should include it. In the event of an accident he will be held responsible morally, if not legally; his reputation will be damaged and a scare created. When sending in his specification he should set out in good, bold writing that what he is quoting is guaranteed from anything deleterious. The German manufacturer who supplied my old firm with the enameled ware which I introduced all over this country not only gave them a guarantee of purity, but assured them that if he produced anything in his manufactory likely to be injurious to the health of his countrymen he was liable to imprisonment and to have his property confiscated. An important question arises here: Who is flooding the market with the tea shop and bazar rubbish? If German, it is fair to assume that the penalties I have quoted do not apply to export goods. If English or Scotch, they cannot possibly give the guarantee to their customers without imperiling themselves. Prior to the glaze being put on the enamel is porous, and unless these small pores are filled up by the glazing they retain portions of the last food or chemical used in them, however well washed. So you will see how absolutely necessary it is for the articles to be well glazed, and this process being the most costly of all in the manufacturing, cheapness can only be brought about by lack of quality. The English enameled ware trade is in its earliest infancy and cannot possibly help progressing, as slowly but surely it will squeeze even the cheap tinware out when the British makers have got the right plant for making the blanks. Many of the so-called English lists of enameled ware are mainly made up of foreign goods. Further, this ware will supersede tin. To illustrate a case, we have had in daily hard use at home three enameled German saucepans for upward of ten years, and, as far as one can judge, they will last a few more years. How many tin ones, however good the quality, should we have worn out in the same time? The bulk of the tin plates made now are positively useless for wear. If an English manufacturer could make me certain shapes I could enumerate in enameled ware I could command sales by just putting the articles before my customers and allowing them to appeal to their common sense.'

"As it has been admitted all round that the American enameled ware is at the present time the best made, American makers should use this discussion by way of an advertisement, which I am convinced would bring them good results."

Counter for Nails, Butts, Hinges, &c.

A counter for holding nails, butts, hinges, &c., in the store of Herbert T. Clark, Willimantic, Conn., is shown in the accompanying illustration. As will be seen, the bins are placed on the store floor, to which

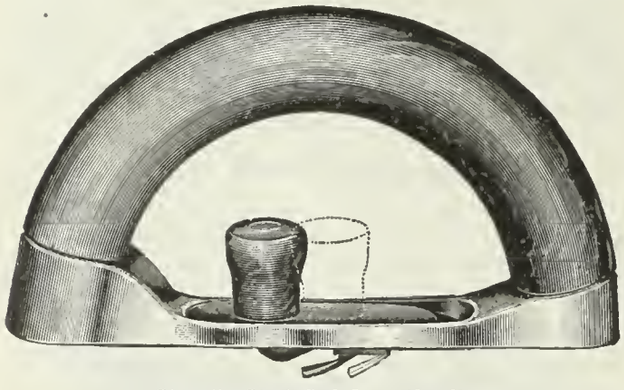
A Counter for Nails, Butts, Hinges, &c.

they are hinged in front. These bins are 12 inches wide, 13½ inches deep, 22½ inches high in front and 16 inches in back. On the front of each of these is placed a handle by which it is pulled down to allow nails to be taken out. Above the nail bins are compartments for holding butts, hinges and similar goods. It is claimed that this is a very convenient and compact way of accommodating this line of goods.

BENJAMIN W. CLARK has sold his retail Stove and Tinware business, at North Abington, Mass., to Edward Monehan.

The Triumph Fruit Can Wrench.

The Forbes Chocolate Company, 229-233 Sheriff street, Cleveland, Ohio, are offering the fruit can wrench herewith shown. It is stamped out of sheet steel and riveted together. The top edge of the can cover is firmly grasped in such a manner, it is explained, as not to break the top of the can, as the wrench cannot drop lower than ¼ inch, which prevents it catching the glass. Among the points of excellence claimed for the wrench by the manufacturers are the following: That it will not break the can or the cover, that it will not slip or become worthless from long usage, that it saves



The Triumph Fruit Can Wrench.

cans, rubbers and covers, that it insures the fruit being properly sealed during the canning season, and that it saves many times its cost each year by preventing the imperfect sealing of fruit jars.

Stuart's Steel Sad Iron Handle.

The Milwaukee Automatic Machine Company, Milwaukee, Wis., are manufacturing Stuart's steel sad iron handle, which is herewith illustrated. This is a handle of new construction, the metal part being made of a steel stamping, which is unbreakable. The gripping device is so constructed that the handle is forced in place on the sad iron without touching the knob. It is released

Stuart's Steel Sad Iron Handle.

by sliding the knob backward, as shown in the dotted lines in the illustration. The grip, it is claimed, will not wear loose. The steel portion of the handle is nickel plated. The handle is so constructed as to fit any Potts iron.

Columbian Enameling & Stamping Company's New Plant.

The Columbian Enameling & Stamping Company, Terre Haute, Ind., is the name of an organization recently formed to carry on a manufacturing business in high grade enameled kitchen and house furnishing goods. It is really an outgrowth of what until December 31, 1900, was the Bellaire Stamping Company, Harvey, Ill., an old established business, whose plant on the date named was destroyed by fire. They are prepared to resume business where the old company left off and will place in the market again all of the goods made under the Bellaire Company's patents and registered trade-marks. They have the former expert employees of the Bellaire Stamping Company, and expect to have the factory in operation the latter part of March, 1902. The company now have their full equipment of machinery, tools, &c. They also have in place, ready to connect, the boilers, engines and generators. They expect to operate their plant wholly by electricity and have installed two units of 450 horse-power each. The capacity of the steam plant is 600 horse-power. The only work now remaining to complete the plant and have it ready for operation is the steam fitting, which is going on rapidly. The warehouse is 64 x 196 feet, four stories high, and is of slow burning or mill construction, equipped with automatic sprinklers. The stamping department is a one-story fire proof building, 140 x 260 feet. The enameling department is a one-story fire proof building, 260 x 285 feet. The power plant is inclosed by a fire proof building, all of these fire proof buildings being of brick, steel and tile construction. There are three switches connecting with the various departments of the business. The switches connect directly with the Big Four, Chicago & Eastern Illinois and the Vandalia-Pennsylvania lines.

The Bates-Hawley Signal Mail Box.

The Signal Mail Box Company, Joliet, Ill., have just placed on the market the mail box herewith illustrated, which is designed for either rural or city delivery. Fig. 1 is a representation of the box and Fig. 2 is a

Fig. 1.—The Bates-Hawley Signal Mail Box.

sectional view, showing the manner in which the signal flag is operated. This box is of full Government size, 18 x 6½ x 11½ inches. It is made of heavy galvanized metal throughout, completely weather and rust proof. It is arranged to attach to the company's Everlasting steel post, or to an ordinary wooden post, as desired. The company state that both box and post conform to all post office requirements and have the full indorsement of the Postmaster-General. The box is handsomely decorated with aluminum bronze and red, and is sufficiently attractive in appearance to harmonize with

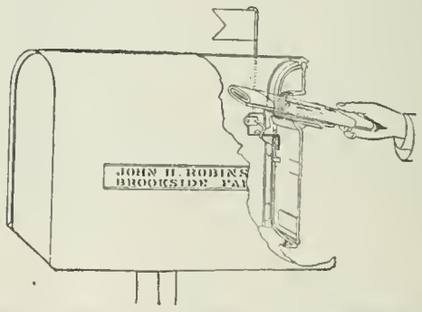


Fig. 2.—Sectional View of Signal Mail Box.

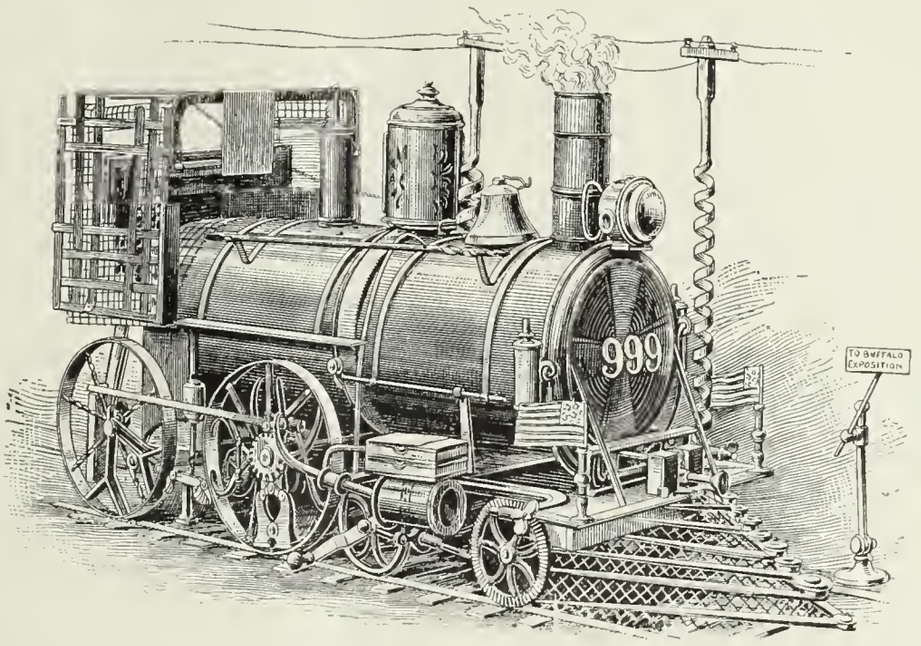


the finest surroundings. The signal flag on this box is raised automatically when a letter is deposited and is automatically dropped when the door is opened for removing mail, making it unnecessary to examine the box closely to ascertain whether it contains mail or not. This is a great convenience to both the owner and the carrier. The locks are of the best master keyed grade, no two alike, each lock being provided with two keys for the owner's use. A master key which will unlock all boxes is provided for the carrier, so that he can collect mail, which gives the owner absolute security. The lock is so arranged that whenever desired the owner can keep the box unlocked. The owner's name is stamped in an attractive celluloid plate, which can easily be changed. An iron bracket and bolts for fastening are furnished with each box.

A Hardware Locomotive.

A locomotive 42 inches long and 20 inches high stands in the show window of A. W. Gerstner, 632 to 634 Eighth avenue, New York. It is constructed entirely out of articles taken from their stock by Sidney Stansbury, one of the clerks, who claims it contains some radical improvements over the famous Empire State engine, No. 999, after which it was modeled.

The several parts of the locomotive were made up as described below:

Boiler, two plumbers' Furnaces.
Head of Boiler, one Ventilator.
Front Truck, four Hand Drills.
Platform for Truck, two Squares and six Scale Rules.
Cylinders, two piano makers' Glue Pots.
Steam Chest, four Pocket Levels, four Scrapers.
Steam Pipe, two Blow Pipes.
Cow Catcher, six Calipers.
Draw Head, Dowel Pointer and Wire Cutter.
Front Rod to Boiler, two legs for Starrett's Dividers.
Piston Rod, two legs for Starrett's Dividers.
Frames and Guides for Piston Rod, two Hack Saw Frames.
Westinghouse Air Brakes, two Chucks.
Shoe for same, two Thread Gauges.
Connecting Rod for Driving Wheels, two Saw Blades.

A Hardware Locomotive.

Cab, Hack Saw Frames and Blades.
Smoke Stack, one plumbers' Grease Cup.
Head Light, one Pocket Lantern.
Bell, one Hand Bell.
Sand Box, one Brazing Lamp.
Sand Box Tube, two Blow Pipes.
Whistle, one Brazing Lamp.
Hand Rails on Boiler, two bell hangers' Bits.
Walk along Boiler, two Steel Rules and two Brass Rules.
Smoke, Russia Hemp Rope.
Telegraph Poles, three Ship Augers.
Railroad sign, one Surface Gauge.
Side Lights, two Alcohol Torches.
Eccentric Rods, two Blow Pipes.
Fire Box, two Combination Squares with center heads.

The four driving wheels are 8 inches in diameter, each being brass bound. The hubs of each are made of Wire Gauges. The spokes of the first is composed of a pair of Starrett's Cutting Nippers, two Thread Calipers and Center Punch; the second of two Center Heads, two Scale Rules, four Twist Drills and two Flat Metal Drills; the third of four Pin Vises and four Screw Driver Bits, and the fourth of one pair of Hall's Cutting Nippers, one pair End Cutting Nippers and five Taps. Electric Wire Couplings were used for the driving rod pins. The track is made of Saw Webs and the ties of 2-Foot Rules.

Morton Hardware Company, Birmingham, Ala., have been organized with a capital of $5000. Their line comprises Hardware, Shelf and Heavy, Stoves and Tinware, Agricultural Implements, Sporting and Athletic Goods, &c.

The Show Window.

The show window display, like the newspaper advertisement, should be changed frequently. A long standing display will bring in business but little better than a long standing newspaper advertisement. Like the newspaper advertisement, the show window should be in charge of one person who will give it careful attention. Many retail dealers in stoves, tinware, hardware and house furnishing lines neglect their windows and do not get as large returns from them as is possible, but there is evidence of a stronger tendency among the trade to avail themselves of this cheap and effective means of advertising.

Stove and Hardware Dealers.

H. M. Bailey has lately opened up in the wholesale and retail business in Sheffield, Ala. His stock comprises Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Sporting Goods, Paints, Brushes, Cement, China, Glassware, &c. Mr. Bailey has a new store, which has been specially fitted up for the business.

J. F. Van Deren has sold a half interest in the Van Deren Hardware Company, Lexington, Ky., to W. M. Van Deren. The style will continue unchanged. The concern are wholesalers and retailers of Shelf and Heavy Hardware, Stoves, Tinware, Sporting Goods, &c. They are putting two more traveling salesmen on the road.

W. R. Ostrander & Co., 22 Dey street, New York, have just issued the thirteenth edition of their illustrated trade catalogue, containing 296 pages. In it are shown large assortments of Speaking Tube Hardware, Electric Bells and Batteries, Electric Lighting Material, Telephone and Telegraph Instruments, and general lines of Electrical Supplies, of which they are large manufacturers. They also deal largely in Bell Hangers' Hardware and Electricians' Tools.

Ford Hardware Company, wholesale and retail dealers in Hardware, Farm Implements, Stoves, Buggies, Blacksmiths' Supplies, &c., Washington C. H., Ohio, advise us that there has been no change in their style since they began business two years ago. From time to time they receive from manufacturers and jobbers communications addressing them under other styles, which they fail to understand, as the business has been conducted under the same name from the first.

Hoy & Schroeder, dealers in Heavy and Shelf Hardware, Stoves, Furnaces, Tinware, Sporting Goods,

Plumbing Goods, &c., Postville, Iowa, have been succeeded by Schroeder & Stone, Mr. Schroeder having taken into partnership with him E. S. Stone.

J. T. Whitfield has sold his Hardware, Stove and Sporting Goods business in Warrensburg, Mo., to Ben T. Sams.

G. H. Griswold is successor to Holton & Lawyer in the Hardware, Stove and Agricultural Implement business in Tennessee, Ill.

W. H. Millspaugh has moved his Hardware and Stove business from 23 and 25 Phelps street, Oneida, N. Y., to 45 Main street, where he will also conduct a first-class tin and jobbing shop. Mr. Millspaugh is also interested in the Bicycle and Fishing Tackle business of W. H. Robinson & Co., in the same town.

G. R. Dill has disposed of his Hardware, Stove and furniture business in Belvidere, Neb., to Sigel Matson, who will continue at the old stand.

E. B. Mundy has lately opened a Hardware store in Avoca, O. T., handling also Stoves and Tinware, Agricultural Implements, Sporting Goods, &c.

Daniel Wood has sold a half interest in his Hardware, Stove and Agricultural Implement business in Hillsboro, Iowa, to R. E. Watts, and the style has become Wood & Watts.

A. T. Swanson has just moved his stock of Hardware, Stoves, &c., from Marysville to Pony, Mont., where he occupies a new store building. Mr. Swanson carries a full line of Hardware, Stoves, Glass, House Furnishing Goods, and also conducts a tin shop.

The Iron Clad Mfg. Company, New York City, are reported to have obtained a considerable contract for Galvanized Water Buckets for use in the military barracks in Northern India. They expect to ship some 500 of these Buckets to India monthly for some time to come.

The City Forge & Iron Works, Dayton, Ohio, have sent us a number of circulars which they are distributing in the interests of the Steel Tubular Trucks, Gem Box Trucks, S. & S. Patent Stove Pipe Thimble and the Gem Bicycle Stand, which they are manufacturing.

W. J. O'Neil, 20 Crown street, New Haven, Conn., dealer in Furnaces, has just laid in a stock of Gas and Oil Stoves, which he offers for sale at reasonable prices.

McRae & Son, St. Johnsville, N. Y., announce that they have purchased the stock and good will of James McLean in the Stove and House Furnishing Goods business, at 112 North James street, Rome, N. Y. The firm will put in a complete line of Sterling Ranges and other goods and run it as a branch of their St. Johnsville store.

The Stove store of Riggs & Berrell, at 5 East Fourth street, Wilmington, Del., was recently damaged by fire to the extent of $1000.

R. I. Kingman, for many years confidential clerk for R. L. Rossman, 557 Warren street, Hudson, N. Y., and after Mr. Rossman's death manager for the estate, has purchased his Stove and Hardware business, and will continue to conduct it at the old established stand. Mr. Kingman takes possession April 1.

The Anshutz Mfg. Company of Frankford, Ind., have been incorporated with a capital of $10,000 to manufacture a newly invented Dust Pan.

S. B. Emery & Co. have added a Stove and Tinware department to their store at Sanford, Maine.

E. M. Best has opened a Stove and Tinware store at Peterborough, Ont., Canada.

The reduction of $41,000,000 in the exports of the United States for the eight months ending with February, 1902, is not considered at all discouraging by those interested in the growth of our export trade, nor is it an indication of a decline in the general growth of that trade. On the contrary, in all important articles except three in which conditions are abnormal, there has been an increase. The decrease is solely or practically so in corn, due to the great crop shortage caused by the drought of last summer; in copper, in which prices have fallen materially, and in iron and steel manufactures, due to the unusual demand of the home market upon our manufacturers and the reduced demand in foreign markets. In these three items, in each of which the falling off in exports is due to exceptional causes and may be considered as temporary, the reduction is over $70,000,000, while the total reduction in exports for the eight months ending with February is but $41,000,000, showing that in other articles than those in which conditions are abnormal there has been an increase in exports of more than $30,000,000. Even with this decrease of $41,000,000, the United States still stands at the head of the world's exporting nations, the total exports of domestic merchandise being: United States, $957,986,427, and the United Kingdom, which most nearly approaches the figures of the United States, $911,346,250.

The American Exhibition in London.

Preparations for the opening of the American exhibition, to be held at the Crystal Palace, London, from May to October of this year, are said to be progressing very favorably. The exhibition is designed to demonstrate the immense commercial and industrial development that has taken place in the United States during recent years, and it promises to be the largest and most important exhibition of purely American products, arts, industries and inventions ever made abroad. The natural advantages of the Crystal Palace for the accommodation of such an exhibition are well known. The buildings cover 16 acres, and are all perfectly lighted, heated and ventilated. They are surrounded by some of the most beautiful ornamental grounds in Europe, extending over 200 acres. The Crystal Palace is within easy reach of all parts of London.

The fact that the exhibition will be held at a time when crowds of visitors from all parts of the world will be in London to witness the coronation of King Edward VII. makes the time of the exhibition peculiarly auspicious, especially as quite a number of celebrations connected with the coronation festivities will be held in the grounds of the Crystal Palace. In connection with the exhibition a commercial bureau is to be established, where all necessary information will be supplied to exhibitors as to channels of trade and the placing of goods upon the British and Continental markets. The bureau will be under the direction of a committee of representative American and British firms. Special juries will be selected to judge the merits of exhibits, and medals and diplomas will be awarded.

The classification of exhibits includes the following:

Class 1.—Machinery and Mechanical Industry:

A.—Mining, agricultural, printing, electrical, traction, &c.

B.—Shipbuilding, locomotives, railway and engineering equipment.

C.—Automobiles, bicycles, typewriters, sewing machines, laundry, domestic and labor saving appliances, &c.

D.—Hardware, tools and cutlery.

Class 2.—Natural and Agricultural Products, Including Cotton, Timber, Mineral Ores, &c.

Class 6.—Hygiene, Lighting, Heating, Ventilating and Sanitary Appliances.

The commissioner for the United States is Alfred H. Post, Produce Exchange, New York, from whom all information regarding the exhibition, together with plans of the floor space for exhibits, &c., may be procured.

Hjalmar Lange, a Danish inventor, has taken out a patent in Denmark for a process of soldering aluminum which consists of first coating the aluminum surfaces to be soldered with a layer of zinc. On top of the zinc is melted a layer of an alloy of one part aluminum to two and one-half parts of zinc. The surfaces are placed together and heated until the alloy between them is liquefied.

On March 17 a decree was issued by the Spanish Government establishing an eight-hour day for all working people on the State domains and in the State mines, workshops, &c., and providing that each hour of overtime is to be paid for at the rate of one-eighth of the daily wage.

APPORTIONING RADIATION.

BY B. R.

Having successfully proven the following basis for determining the amount of radiation required for a building in my own practice, I have recommended it to others who have also demonstrated its usefulness. So I now present it to the readers of *The Metal Worker* for such use as they may wish to make of it. A man of experience will apply these rules with some judgment, and common sense is an important factor that can be brought into use by any one. As will be seen by a little study the method of proceeding includes consideration of five factors or formulas and the results to be subject to given multipliers adopted for different kinds of steam and hot water plants:

1. Width of room by length of room by hight of room equals cubic feet of air in room.

2. Cubic feet of air in room divided by 75 equals equivalent of glass cooling effect of room.

3. Find actual square feet of glass in room, measuring between casings.

4. Reduce the square feet of exposed wall in room to equivalent of glass cooling effect by dividing by 10 if wall is 8 to 13 inches thick, by 15 if wall is 13 to 25 inches thick, and by 20 if wall is 25 to 33 inches thick. This is for walls only having an air space.

5. The glass equivalent derived from cubic feet of air in room in square feet (Formula 2) plus the actual glass, in square feet, in room (Formula 3), plus the glass equivalent derived from exposed wall in square feet (Formula 4), and this total multiplied by—

FOR HOT WATER HEATING.

0.80 equals direct radiation; outside temperature, 0 degrees; inside temperature, 70 degrees; water, 180 degrees.

1.20 equals indirect radiation; outside temperature, 0 degrees; inside temperature, 70 degrees; water, 180 degrees.

1.05 equals direct-indirect radiation; outside temperature, 0 degrees; inside temperature, 70 degrees; water, 180 degrees.

FOR STEAM HEATING

0.48 equals direct radiation; outside temperature, 0 degrees; inside temperature, 70 degrees; steam, 219 degrees (2 pounds).

0.72 equals indirect radiation; outside temperature, 0 degrees; inside temperature, 70 degrees; steam, 219 degrees (2 pounds).

0.64 equals direct-indirect radiation; outside temperature, 0 degrees; inside temperature, 70 degrees; steam, 219 degrees (2 pounds).

ILLUSTRATION: Room 10 × 20 × 10 = 2000 cubic feet of air in room. 2000 ÷ 75 = 26.6 (approximately 27) = equivalent of glass in cooling effect.

3 windows, 3′ × 5′, = 45 square feet of glass; 30 lineal feet of wall multiplied by hight, 10 feet, = 300 square feet, less glass, = 255 actual square feet of wall ÷ 10, if 8″ to 13″ wall, = 25.5 (approximately 26) = equivalent of glass in cooling effect.

27 (equivalent of glass from air in room) + 45 (actual glass in room) + 26 (equivalent of glass in exposed wall) = 98.

Multiply 98 by 0.80 = 78.4 square feet of water radiation required to heat room to 70° when outside is 0°, with water at 180°.

Multiply 98 by 0.48 = 47.04 square feet of steam radiation required to heat room to 70° when outside is 0°.

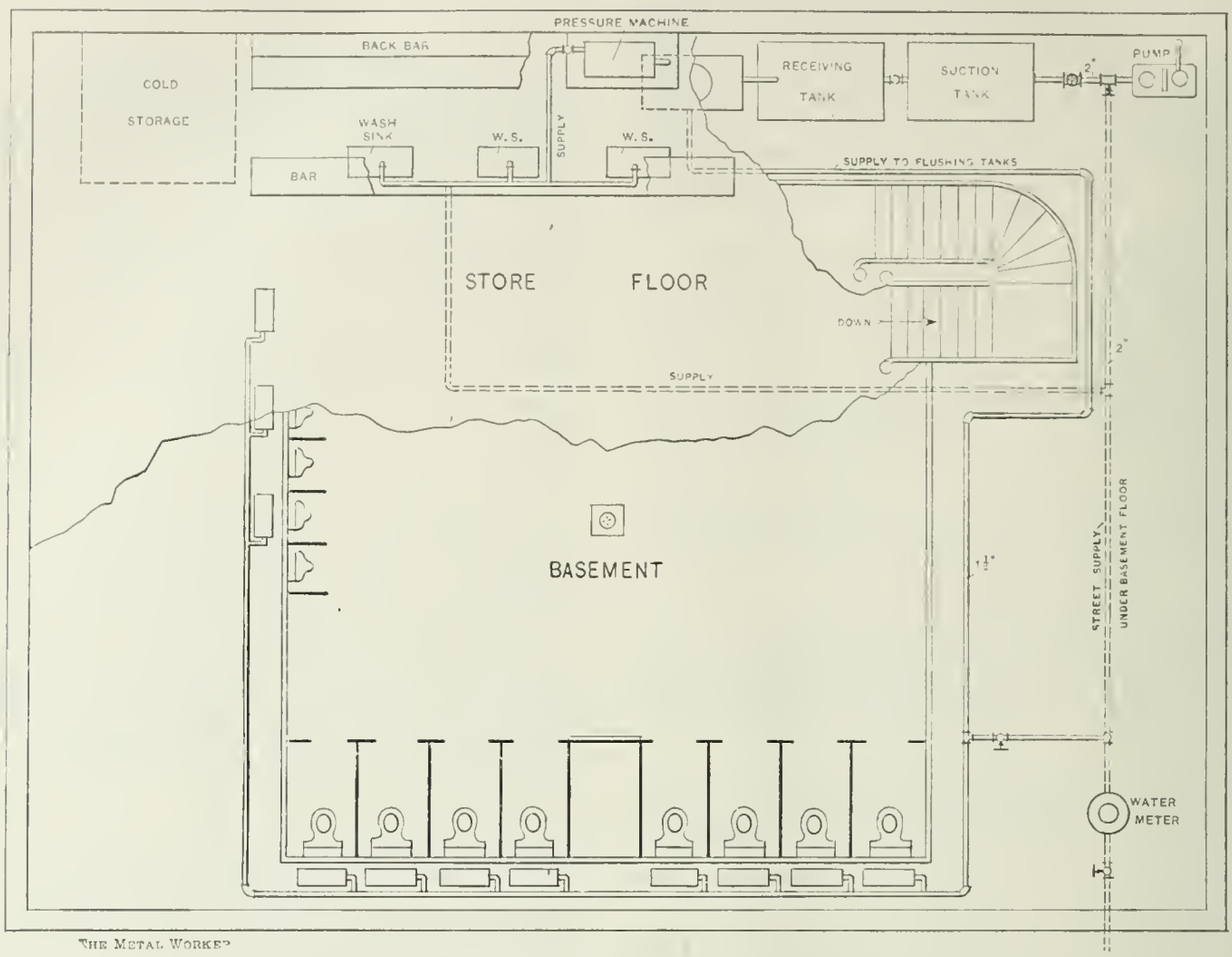
James B. Clow & Sons' New Building.

James B. Clow & Sons, who for many years have been located at Lake and Franklin streets, Chicago, are transferring their stock to their new building, at Franklin and Harrison streets. This structure is one of the most substantial and best equipped of the many fine buildings recently erected in Chicago. It will be used for office, warehouse and manufacturing purposes. The Clow office force is nearly settled in the new quarters and machinery is now being purchased for the enlargement of the brass foundries and the finishing and cabinet works of the sanitary manufacturing departments, which will soon be located on the upper floors. Heaters will be manufactured in the basement, where the pipe cutting and radiator assembling shops will be located, the radiators being manufactured at the Clow pipe foundries, at Newcomerstown, Ohio. The assembling of plumbing fixtures will be done on the fifth floor and the offices and showrooms will be located on the second floor, while the remaining floors will be largely used for stock. This building, which was designed by Holabird & Roche of Chicago, has the famous saw-tooth roof, affording all northern light for the seventh floor foundries and shops. W. A. & A. E. Wells of Chicago are the contractors. Every labor saving device applicable to this line of business is being introduced both in the sales and manufacturing departments. The shipping facilities of the new location are also ideal, with prominent thoroughfares on two sides of the building, the river on a third side and a special track, running into the basement, connecting directly with all the main lines of the South, Southeast and Southwest.

The Sanitary Earthen Ware Trade.

The Sanitary Potters' Association, in making the new prices which went into effect on March 1, did so with a full knowledge of the conditions which previously prevailed in the trade, and with a set purpose of eliminating the objectionable features of those conditions. The new rules of sale adopted by the association, which also took effect on the first of the month, make the purchaser a party to the maintenance of the price named by the manufacturers. The jobber is put upon a rebate basis which will be given him by the association, and in order to get the rebate he is compelled to make affidavit that he does not buy his wares at a price better than that named by the association. If he does get a better price, he is compelled by the terms of his agreement to divulge the price at which he is buying, so that all manufacturers can make prices equal to those quoted.

This agreement will probably be effective for a certain length of time, but it hardly seems to contain the element of permanence. It has always been found that where prices are equal the bulk of the business with the jobbing trade goes to the plants that are making the best goods. The concerns that are making goods which are not up to the highest standard are consequently compelled, in order to sell their material, to quote a materially lower price than that agreed upon. It is this consideration that would appear to threaten the permanent endurance of the Sanitary Potters' Association. The pooling of the interests of the different plants will naturally tend to prolong the life of the organization and keep the small and newer concerns in line. It does not take much over a year, however, to demonstrate to the manufacturer of poor goods that he will have to go to greater expense in producing his wares in order to market them, or else put his prices below those agreed upon by the association. Of course, a great many buyers will for business and sentimental reasons continue to give their trade to the smaller plants. They will not care to change the designs and styles on which they have built up a trade, but it will ultimately be found that where a customer is aware that he can get a better grade of goods at the same price that he has been paying for the inferior ware he is likely to change his jobbing house. The present agreement among the manufacturers of sanitary ware will run for one year from March 1, and until the expiration of that time there is likely to be little or no change in prices.



Acetylene in the Laboratory.

An interesting paper, says the London *Ironmonger*, has been published lately by C. H. Higgins, on the use of acetylene in bacteriological laboratories, which are often erected, temporarily or otherwise, in localities where coal gas is not available. Chemists of former generations had to conduct their operations which required heat with methylated spirit or coke; but the chemists of the present day have forgotten or have never seen the wonderful furnaces of bygone times, and without coal gas are almost as helpless as without a laboratory at all. Mr. Higgins was called on to conduct bacteriological experiments on bubonic plague in some wild part of British Columbia, and, needing something to heat his various apparatus, selected acetylene. He arranged to have a double set of gas pipes throughout the laboratory. One set, connected with the gas holder, delivered acetylene at a pressure of 4 inches to serve the Bunsen burners and the boiling stoves; the other set of pipes supplied through a governor to reduce the pressure to 2 inches, which best suited the jets employed to illuminate the building. One of the latter was used for microscopic work, and seems to have entire satisfied Mr. Higgins. A ¼-inch pipe was found to be large enough to supply 18 ordinary Bunsens.

REDUCING WATER EXPENSE AND WASTE.

BY D. F. N.

In a recent article in *The Metal Worker* I noted how the officials in the city mentioned disposed of extravagant water consumers. This recalls a demand for my services to reduce the expense for water that had been experienced by the owner of a modern hotel in New York City. Having received from the city a bill for $360 for water service, he desired to curtail his expenses by utilizing some of the water that had hitherto gone to waste. Some idea of the number and character of the fixtures in the hotel may be gained from Fig. 1, which is a plan of one of the floors. Fig. 2 is an elevation showing the means resorted to for reducing the water bill.

Reducing Water Expense and Waste.—Fig. 1.—Plan Showing Fixtures Supplied.

The principal cause of the expense was a machine placed over a sink behind the front bar, for maintaining pressure in the barrels in the cold storage room in the basement. This machine was operated by means of water power derived from the city water supply. The large water bill was the result of allowing the water which had passed through the machine to run to waste through the sink and then to the sewer, an almost continuous flow being maintained. On examining the fixtures and piping with a view to affording relief, I noticed a ½-inch supply pipe from the street main connected with the pressure machine, and a ¾-inch discharge pipe from it to the sink. Every time the machine operated a discharge would take place, with a considerable loss of water. The water which once went to loss is now utilized in the following manner:

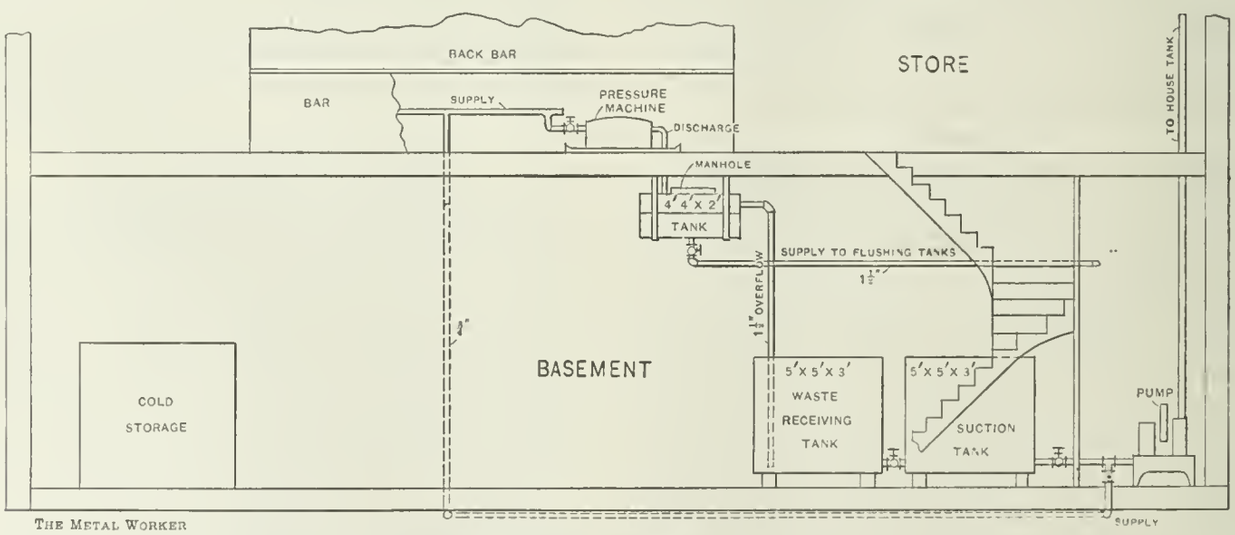


Fig. 2.—Apparatus for Utilizing the Waste Water.

Two tanks 5 feet square and 3 feet deep were made and lined with tinned copper, each being of 2-inch planking, well bolted together. These were placed in the north passageway adjoining the large toilet room shown in Fig. 1. On the floor beams of this passageway a smaller tank, 4 feet square and 2 feet deep, was

supported by means of heavy iron straps. Above this small tank the pressure machine was located, the floor under the machine being covered with sheet lead with beveled strips 6 inches high around the edge, so that any overflow might be prevented from doing damage, and also to catch the discharge from the machine. From this lead safe a ¾-inch pipe was carried down to the tank on the ceiling, shown in Fig. 2. From the bottom of this tank a 1½-inch galvanized iron pipe was carried around, as shown in Fig. 1, to supply the flushing tanks to the water closet and urinals in the toilet room below. When the water was not all used in the toilet room it overflowed into the larger tanks on the lower floor.

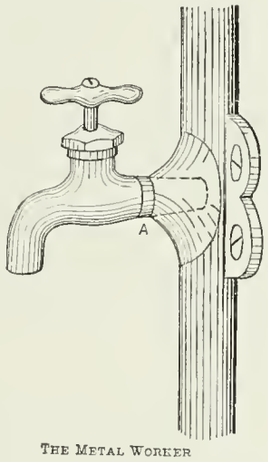
One of these tanks was arranged to serve as a suction tank to a Rider pumping engine. This pumping engine also was connected with the street main, in order to secure a supply in case the tanks did not furnish all the water required. The water from these waste tanks was pumped to a large tank in the upper part of the building, which supplied the different toilet rooms and bathrooms on the upper floors. As the Rider engine had to be operated to force water to the house tank, it is utilized now for saving water that had in the past been wasted, and as there has seldom been necessity for pumping the water from the street mains it is anticipated that a substantial reduction will be effected in the water bill.

HIGH PRESSURE GAS LIGHTING IN ENGLAND.

The recent volcanic eruption in the Welsbach affairs of this country, says our London correspondent, has stimulated interest in various quarters relating to gas engineering. Joseph Nasmith, in a paper on "Intensified Gas Lighting," read before the Manchester Association of Engineers, referred to the fears which years ago pervaded many minds that the introduction of electricity would end forever the era of gas illumination. His opinion, however, was that gas was far from being a defunct lighting medium, and that, as a matter of fact, it was in greater demand than ever, not only for lighting but for heating. After referring to the merit of the Welsbach patents he expressed the opinion that the improvement made by the Welsbach was by no means at an end. He thinks that in a few years we shall have better and cheaper mantles in public use.

Another stage in the development of gas, in his opinion, was the introduction of high pressure, or intensified, gas lighting. The present Bunsen type, used in incandescent gas lighting, was liable to different results, according to the pressure of the gas in different localities. The pressure was generally not much over 1 inch water gauge. It was obvious that at this pressure the velocity of the gas jet and the consequent induced current of air would be comparatively slow. The new method consisted in compressing the gas under a pressure of about 8 inches of water—1-3 pound—and so increasing its velocity at the jet, thereby inducing a greater volume of air to mix with it in the body of the burner. Of course, this pressure was only high in a comparative sense, but it was the first step on a path which may lead us very far.

In considering this last development no pretense was made of doing more than collating the particulars already well known, and it was only because the new method provided an improved method of illumination, which was at once cheap and effective that the attention of the members was directed toward it. It is already making great headway for internal illumination, and especially for workshops, and on that account formed a subject of interest to all engaged in industry.



In considering the question of illumination it must be remembered that mere brilliance was not the highest property, except it was desired to deliver a flash of light to a specific point, as in the heliograph. Diffusion, or perhaps more correctly suffusion, was more important. The light from an electric arc lamp was brilliant, but it was coldly penetrating and diffused itself to a very slight extent. It was this property which caused it to cast so great a shadow. The air was not filled with light as it should be, and outside the direct range of the rays there was no communication of light. How different was the light of the incandescent mantle. Within its range of illumination it seemed to suffuse the air with light and make all the space within that range luminous. Widen its range and you increased its usefulness. It produced no violent shadows like the arc light, but distributed the light with remarkable uniformity. It was the object of the system of intensified gas lighting to widen the range of the ordinary incandescent mantle and thus increase its illuminating value.

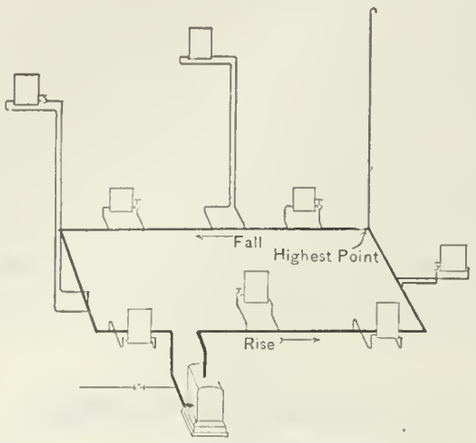
Mr. Nasmith, at the end of his lecture, pleaded for a reduction of the standard from 16 to 14 candles. Such a reduction, in his opinion, would be a benefit to all concerned. Compression, or high pressure, was a step in the right direction, and with modern aids would enable a cheaper gas to be effectually employed. At the end of this lecture there was an interesting discussion, in which all agreed that the modern forms of gas lighting were cheaper and more efficient than the electric light. One speaker expressed the opinion that unless a stronger form of mantle were forthcoming the incandescent system would not endure. The lecturer observed, however, that when the Welsbach patent rights expired several improved mantles would be available.

FOR THE SKILLFUL PLUMBER.

BY D. F. N.

A neat little trick that has been accomplished a few times by skillful plumbers is the removal of a sink or shower faucet from a lead pipe without disturbing the

THE METAL WORKER



For the Skillful Plumber.

wood work back of the fixture. To remove the cock without disturbing the wood work, tacks or anything is quite a feat. To do it the plumber must heat the old cock so hot that it will release itself from the solder by a twist with the hand, when it can be drawn out. The new cock must be already tinned and quite hot, ready to take the place of the old one. The tinning of the new cock should extend at least ¼ inch further than usual. Then, when everything is ready and the required heat is reached in the old cock, pull it out and quickly insert the new one. After the cock and the solder cool in the old branch, place paper around the old branch and wipe fresh solder around the extra ¼-inch space that has been tinned on the new cock and left outside of the branch, as shown at A in the sketch. This will make a neat, clean ring of bright new solder tapering back from the cock to the edge of the old branch. In a great many cases the sink has to be taken down, a couple of feet of pipe used, with extra solder, tacks and screws, and possibly with some damage to the wood work. All of this can be avoided, however, by a quick and skillful workman.

FRANK POWERS of Lunenburg, vice-president of the National Association of Master Plumbers of Canada, and president of the Nova Scotia Association, has been visiting Halifax, where the next convention of the National Association will be held, opening Tuesday, July 1. Mr. Powers has been making provision for the convention and the delegates.

A One-Pipe Hot Water Heating Apparatus.

With the older two-pipe system of obtaining hot water circulation, says the London *Ironmonger*, the principle involved is that of taking hot water to radiators (or coils and sets of pipe) and, on the water leaving each radiator, letting it enter a return main which conducts it back to the boiler to be reheated. In other words, the water in any one radiator does not pass to a second or any other radiator until it has been back to the boiler to

A One-Pipe Hot Water Heating Apparatus.—Fig. 1.—A General View of the System.

be reheated. With the one-pipe system of work the reverse of this applies. The water served to a radiator passes back into the same main, and goes on to do further work.

The one-pipe method of work is a favorite one with many engineers, and it certainly acts positively and well. It is practically impossible for any radiator to escape being heated. Short circuit, so easily obtained with two-pipe work, is hardly possible with one-pipe circulations.

Fig. 1 gives in perspective outline a simple one-pipe apparatus, consisting of a single main circuit only. In large works there may be two, three or more circuits, in which case it is desirable to run each circuit independently. All the flows and returns should have distinct connections at the boiler. If a main must be branched, it should be only the flow pipe, never the return. An apparatus in which one flow pipe leaves the boiler, and, say, three returns come back to it, will work well if the pipes are proportioned with ordinary care; but to branch a single flow and join the ends of the branches into one return is to court failure. Fig. 2 (plan) will serve to illustrate this, and it has the advantage of representing actual practice. The central pipe was the branch, and was a smaller sized pipe than the main circuit. The water in it remained as still as if the tube had been plugged.

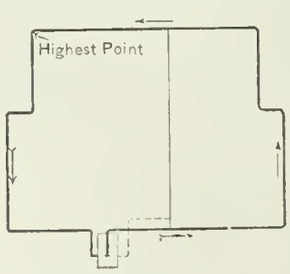


Fig. 2.—Showing Remedy to a Faulty System.

The main circuit worked freely and well, and this branch got hot for about 2 feet at each end. Apparently the water in it was stationary, although some of the heated water circulating past the tees worked into it, as it might have done if the pipe had a closed stop valve in it. The alteration made was to disconnect the end on the flow near the boiler and take it into the boiler as a return, as shown by dotted line. The circulation then ran through a flow pipe out from the boiler and returned through two returns—one main and one branch. The apparatus worked perfectly after the alteration, without any perceptible difference in temperature in the main and branch. It will be understood that the pipes shown had radiators connected here and there upon them, but they have been omitted here in order to make the arrangement of the line of pipe clear.

Another difference between the two-pipe and the one-pipe systems is that while with the former the pipes may be gradually reduced in size as they get away from the boiler and past the work, with one-pipe circuits no reduction is possible unless the circuit is branched; then two branches together need be of no greater area than the one pipe from which they take their supply.

The one-pipe system is of particular advantage when the work is scattered. As a typical case, under good conditions for the system, we might instance a large building of one or two floors—say, a bank or a large shop. The main circuit is carried around the basement, passing all the scattered points where the radiators are, as Fig. 1 will serve to show. Sometimes the area to be heated is too large for radiators fixed round the outer walls only, and central ones are needed. Fig. 3 shows a favorite scheme of piping in such a case, a flow going out up the center of the building or thereabouts to take the radiators there, and branching into two returns to take those around the outer walls. The single flow would have an area equal to the two returns, but no other variation in the sizes of the mains is permissible.

The radiator connections are out and in the one pipe, as shown in Fig. 4, and the movement of the water is indicated by the arrows. Some fitters make a practice of connecting both pipes to tees in the mains with the

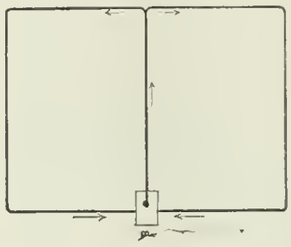

Fig. 3.—A Double Circuit.

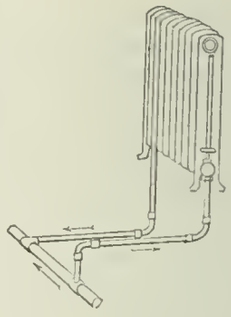

Fig. 4.—The Radiator Connections.

branch turned upward, but a more correct method is to have the branch on the flow tee up, and that on the return horizontal, as sketch in Fig. 4. Water, when it has passed through a radiator, is cooler than the water in the main, and although fit for some further service, it is undesirable to bring it back onto the top of the hottest water in the main. The water in the main pipe becomes divided into a top stratum of hot water and a somewhat cooler lower stratum when it has passed through two or three radiators, and by bringing the return water in horizontally, as shown, it affords the best opportunity for the hottest water to pass along the top of the pipe to the more distant radiators. In other words, it is not a good plan to mix the water from the first radiators with the hotter water which is passing to the further ones.

In the one-pipe system of hot water work greater care is necessary in adjusting radiator valves than with a two-pipe apparatus. When the number of radiators on a circuit of, say, 2½-inch pipe exceeds about six, then there is a very noticeable difference in the temperature of the first and of the sixth one if the valves are not regulated. The remedy then is to regulate the valves—advice easily given, but somewhat hard to follow. The fitter may regulate them and get excellent results, but so soon as he has gone, perhaps within a few hours, a servant or other ignorant person meddles with them and the regulation is undone. For this work a valve such as is so largely used on the Continent for steam work is suitable. It is a double valve, one portion, a full way plug valve, being "set" by the fitter, then capped over or made immovable, while the other portion or valve is of the ordinary regulating kind.

It is a good plan to limit the work on a circuit, so as not to put on too great a number of radiators. If instead of one 4-inch circuit it is possible to run two 3-inch circuits, or any smaller pipes equivalent to a 4-

inch, quicker results will be obtained on the last radiators, and they will probably be maintained at a better temperature. Several small circuits are better than one large one, but the latter is quite practicable when the small ones are not possible.

PROPOSED VENTILATION AND SANITATION LAW FOR NEW YORK STATE.

Those who have prepared and are endeavoring to secure the enactment by the Legislature of New York State of the following bill ask the co-operation and assistance of the heating and plumbing trade in the work. The measure, which is considered a worthy one, has failed of enactment heretofore only through the rush at the end of the legislative session. Correspondence and conversation with representatives and Senators urging early action will be likely to have a beneficial effect:

AN ACT TO PROVIDE FOR PROPER SANITATION, VENTILATION AND PROTECTION FROM FIRE OF SCHOOL HOUSES AND OTHER PUBLIC BUILDINGS.

The people of the State of New York, represented in Senate and Assembly, do enact as follows:

Section 1. Every school house and other public building hereafter erected in a city or incorporated village within this State shall be provided with a reasonably sufficient number of proper water closets, lavatories, earth closets or privies for the use of persons occupying or admitted to such school houses or public building; shall be kept clean and free from all noxious smells or gases arising from any closet, drain, privy or other nuisance, and shall be provided with proper means for ventilation in such manner that there shall be at all times a sufficient supply of pure air therein.

Sec. 2. Prior to the erection or construction of any school house or public building the person or persons or corporation owning the same shall submit a full and complete copy of the plans, together with a statement in writing of the proposed building, which statement must contain a clear and comprehensive description, properly sworn to by said owner or authorized representative, of those portions of the proposed work which deal with the sanitation, ventilation and protection from fire of said proposed buildings.

Such details, statement and copy of the plans shall be submitted to and filed with the Department of Buildings, Health Board or other officer or officers having like jurisdiction within an incorporated city or village where said buildings are about to be erected, and in all other places, including any city or incorporated village not having an officer or officers exercising jurisdiction as a board of health or health officer, such detail statement and copy of plans shall be submitted to and filed with the State Board of Health.

No such school house or other public building shall be erected or constructed until such specifications and plans shall have been approved in writing by the Department of Buildings, Board of Health or officer exercising jurisdiction thereof, to whom such plans shall be submitted as required by this act.

The sanitation, ventilation and protection from fire of every such school house or other public building, as provided by this act, shall be subject to the inspection of such Board of Health or other officer exercising like jurisdiction during the progress of such erection or construction, by its or his agents or servants, and shall conform in all things to the reasonable requirements of such Board of Health or other officer of like jurisdiction.

Sec. 3. Every such school house and public building for which a detailed statement and plans are filed, as provided by this act, shall be ventilated in such a manner that the quantity of foul or vitiated air exhausted or removed shall be positive and independent of atmospheric changes, and shall not be less than 15 cubic feet per minute for each person; and the quantity of fresh air admitted shall not be less than 15 cubic feet per minute for each person that such school room and public building can accommodate.

Sec. 4. It is further made the duty of such Department of Buildings, Board of Health, health officer or other body or person having jurisdiction to have such inspections made from time to time as may be deemed necessary, to see that the said school houses and public buildings as are built in compliance with this act are kept and maintained in a proper sanitary condition, and that the provisions of this act are complied with.

Should said inspection determine the fact that the provisions of this act are not being complied with, said Department of Buildings, Health Board or health officer, or other officials exercising jurisdiction, shall at once issue a written order to the trustees, corporation or public officers having charge of, owning or leasing said school house or public building, requiring the immediate correction of the violation found, giving such time for their correction as may be deemed best for the public welfare

Sec. 5. All school houses and public buildiugs for which plans and a detailed statement shall be filed and approved, as required by this act, shall provide that all halls, doors, stairways, seats, passageways and aisles, and all lighting and heating appliances and apparatus, shall be arrauged to facilitate egress in case of fire or accident, and to afford the requisite and proper accommodations for public protection in such cases.

All exit doors shall open outwardly, and shall, if double doors be used, be fastened with movable bolts operated from the inner face of the door.

No staircase shall be constructed with winder steps in lieu of a platform, but shall be constructed with straight runs, changes in direction being made by platforms; the rise of said staircases shall not exceed 8½ inches to a step and shall not be less than 9 inches tread, exclusive of the nosing.

Hand rails shall be provided on either side of all staircases.

No door shall open immediately upon a flight of stairs, but a landing at least the width of the door shall be provided between such stairs and such door.

Every public building or place of assemblage accommodating 500 persons shall have at least two exits of not less thau 5 feet in width, and for every additional 100 persons or portion thereof to be accommodated in excess of 300 an aggregate of 20 inches additional exit width must be allowed.

The stone or brick work of the smoke flues for all boilers and furnaces shall be at least 8 inches in thickness and shall be properly capped with stone or other similar material; the inside 4 inches of said flues shall be of fire brick laid in fire mortar for a distance of 25 feet in any direction from the source of heat. All smoke flues other than for boilers or furnaces shall be lined ou the inside with cast iron or well burnt clay or terra cotta pipe, made smooth on the inside, from the bottom of the flue or throat of the fire place and carried up continuously to the top of the flue, each section of the pipe to be built in as the flue or flues are carried up, each side of each flue to consist of not less than 4 inches of brick work, well bonded together; no flue shall be started or built upon any floor or beam of wood, neither shall any flue, beam or joist be placed within 6 inches from the interior of a flue, and no wood casing, furring or lath shall be placed against or cover any smoke flue. or metal pipe used to convey hot air or steam, but in the case of flues for hot air or steam this shall not prohibit the covering of said flues with metal lath and plaster, with an air space of ⅞ inch, and the placing of the wood work directly thereon. No stove pipe shall be placed nearer than 9 inches to any lath and plaster or board partition, ceiliug or wood work, and in the case of furnaces such distance shall be from 15 to 30 inches, unless properly protected with metal, but in no case shall the distance be less than 13 inches.

No vertical hot air pipe shall be placed in any stud partitions or in a wood inclosure uuless it be at least 8 feet distant in a horizontal direction from the furnace. Steam or hot water pipes shall not be placed withiu 2 inches of any timber or wood work.

In the construction of fire escapes the balconies shall be made so as to be easily accessible from the different floor levels, and the rails thereof shall not be less than 30 inches in hight. No iron ladders shall be used in connection with any fire escape, but there shall be provided iron stairways, with a tread of not less than 7 inches and a rise of not more than 9 inches, protected with proper iron hand rails.

Sec. 6. The words "school house" as used in this act shall be taken and deemed to mean any building in which public or private instruction shall be given to not less than ten pupils at one time; and the words "public building" as used in this act shall be taken and deemed to mean any building or premises used as a place of public entertainment, instruction, resort or assemblage, or for the purpose of transacting public business of any kind or uature whatsoever, when there shall be more than ten persons in any such building at any one time.

Provided, however, that this act shall apply only to cities and incorporated villages.

Sec. 7. Any violation of this act or failure to comply with its provisions by any school committee, public officer or corporation or other persons whatsoever shall be a misdemeanor.

Sec. 8. This act shall take effect July 1, 1902.

R. Wilson & Son, Springfield, Mass., have just secured the contract for the plumbing work in two houses now being erected by F. W. Lathrop on Wilmot street.

ASSOCIATION NEWS.

Baltimore Master Plumbers.

The annual meeting of the Master Plumbers' Association of Baltimore, Md., was held in the Builders' Exchange on March 13, when the following officers were elected for the ensuing year:

President, Lloyd Mitchell.
First Vice-President, Samuel Bennett.
Second Vice-President, E. J. Burke.
Financial Secretary, C. H. Frederiek.
Treasurer, J. McCrea.

The following were eleeted delegates to the convention of the National Association at Atlantic City in June: John Trainor, P. T. Barry, Lloyd Mitchell, William H. Rothrock, W. W. Rose, Thomas Bowling, Edward Koethe, Edward Zimmish, Henry Bowman, Allen Bean, William Alford, E. J. Burke, William J. McCrea and James Traynor.

Master Plumbers' Association of Queens, N. Y.

The annual meeting of the Master Plumbers' Association of Queens Borough, New York City, was held Wednesday night at Jamaiea. It was resolved to hold future meetings at Long Island City. Delegates to the State Convention at Elmira reported that action was taken against the Fowler bill, now in the Assembly, which would allow a plumber holding a State license to work anywhere in the State without taking out a local license. The following officers were elected for the ensuing year:

President, Philip Scott, Far Rockaway.
Vice-President, George Perry, Jamaica.
Secretary, Henry Bawman, Woodhaven.
Financial Secretary, John F. Rogers, Flushing.
Treasurer, John Anderson, Flushing.
Executive Board: George M. O'Connor, Philip Scott, George Perry, John Anderson and John F. Rogers.

RUSTY TUBE CAUSES CIRCULATION PIPE TO BURST.

BY J. N. S.

The other day I had occasion to repair the lead elreulating pipe between the water back and a galvanized boiler, which had beeome so expanded and weak that it burst. Upon examining the water back I found that it was clean and, of course, had to look further for the trouble. The boiler was almost new and the lady of the house informed me that it was scareely a year since it was put in. So I thought it would be wise to look at the bottom eonnection on the boiler. After diseonneeting the eoupling on the spud, I put my finger up into the spud, when, lo! it was covered over with thick, rusty scales. Thinking this strange for a new boiler, I took it down and examined the tube. Such a filthy article could scareely be coneeived. It was almost eaten away with rust. The plumber who renewed the boiler put the old tube back again. I eannot believe that he did so because it was cheaper to do it in this manner; but I believe he did not know any better, or else was a very eareless workman. How much more would 4 feet of ½-inch galvanized pipe have cost? Moral: Never replace a boiler unless you renew the tube at the same time.

The upshot of the whole trouble was that the scales of rust prevented the water back from getting water as freely as it required, and, as a natural result, it generated steam, and the constant hammering of this steam against the water in the upper pipe burst it. It might be said if the elreulating pipe was iron it would not have burst. Well, maybe not, but the water back would, and that would have been much worse. Now it strikes me right here that if 4 feet of ½-ineh pipe was used for a tube it would not matter how often the boiler was replaced, the same tube could be used and this at once would make it impossible for such a necessity to occur as the replacing of an old tube in a new boiler.

Mott's New Boilers and Radiators.

Evidence of the popularity of the steam and hot water boilers and radiators made by the J. L. Mott Iron Works, 84 to 90 Beekman street, New York City, is shown in the neeessity that has arisen for better office and showroom faeilities for this line of goods. This department of the company's business has been moved to the seeond floor of their building, where the whole space is devoted to it, the office occupying one end of the floor and the boilers and radiators in different styles being so arranged that they can be seen to the best advantage. This department has been fitted with a hard wood floor and the side walls and ceilings finished very attractively in different tints of green.

The company have a new catalogue in course of preparation which will be ready for distribution in the near future. The eatalogue will show a new plain two-column radiator for steam and hot water, made in the usual hights and also a new and very attractive design of wall radiator. It will also present several new steam and hot water boilers of the vertical sectional type and of the flue arrangement, designed to attract the principal heat from the burning gases, as well as to present a large surface to the direct effect of the fire.

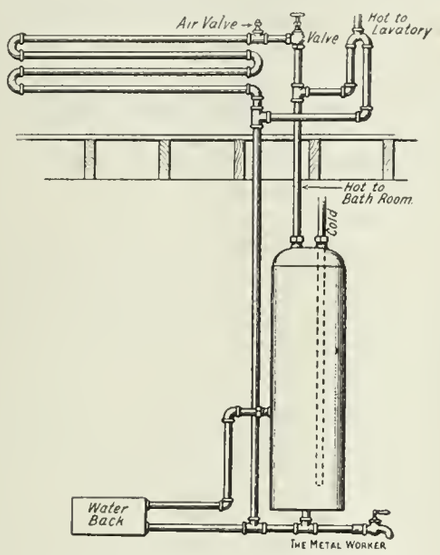
An Electric Radiator.

The increasing use of eleetricity for domestic purposes renders interesting some account of a new electrie radiator which has been brought out in London, England, and referred to by the *Architect* as follows: The deviee consists of a movable form, something like an asbestos fireplaee. It eontains four large electric heat lamps in a polished eopper reflector. The heat is generated by eurrent from an eleetrie supply main. All that is necessary to fix them ready for use is to connect the flexible wires attached to eaeh radiator to an electric plug which forms part of every installation. For high or low voltage they are equally adapted, heat lamps of the requisite eapaeity being supplied, and work satisfaetorily on alternating or continuous current. The standard size of these radiators consists of four heat lamps, sufficient to warm the air of a room 12 feet square, with a eonsumption of 1 unit per hour, but they ean be regulated to one-half by means of the switehes attaehed. For larger rooms or halls two or more radiators ean be used, or radiators can be supplied of a design eontaining six or more lamps, although the first method is preferable, as the heat can be taken to the point where most wanted, a special feature being their portability. But the most important is that they provide pure warm air, no oxygen being consumed by them, nor are any noxious fumes given off. Their appearance is certainly bright and cheerful, and there are no ashes or dirt to be removed after their use.

Paint for Hot Steam Pipes and Radiators

A painter desired to know how to make paint for radiators when there was objection to an addition of oil for a binder for the reason that linseed oil is said to form a non-porous eoating that prevented the transmission of heat. He also desired to know what he should mix with vermillon to have it retain its gloss for a reasonable time on hot steam pipes.

In reply the *Painters' Magazine* says: "Radiator paints are usually made very similar to baking enamels and consist of pigments and fatty varnishes that bake on the metal by the aid of the heat in the pipes. To suit well for the work the pigments must be ground in varnish to the utmost degree of fineness and thinned with a speeial varnish to proper consistency for free application. If the owner objeets to linsced oil, he might equally objeet to painting the radiators at all, unless he speeified that the same be lacquered or done in dry bronze. Even in that case a binder is required to hold the bronze onto the metal, though it would not mean snch a heavy coating as in the case of solid painting.



In mixing paints for steam radiators do not use oil colors, nor add linseed or any other oil, raw or boiled, but

use colors ground for coach work, and thin with good, free working baking varnish, so that the paint will no more than just cover. In this way there will be no blistering, and the gloss will be retained. Use a bright red of good bulk, ground in varnish, for hot steam pipes, and thin to the fullest extent with a good pale baking varnish, and the gloss will be more permanent.

COILS FOR BATHROOM HEATED BY WATER BACK.

BY HELMAR.

It is frequently desirable to heat the bathroom or a back chamber in dwelling houses by means of hot water from the kitchen boiler and range water back. The mechanical work in these cases is so simple that it can be readily done. It is only necessary for the workman to be sure that there is sufficient water heating capacity before he attempts the job. If a cooking stove or range has a fire box of sufficient size, and the water heater

Coils for Bathroom Heated by Water Back.—Fig. 1.—Coil Connected with Circulating System.

presents a large surface for the hot coals to lie against, heating the water in the boiler so that it sometimes causes a rumbling, or if the boiler is filled with hot water from top to bottom, it may be assumed that there is a sufficient water heating capacity to take care of a small radiator on the floor above, without reducing the temperature of the water for domestic purposes sufficiently to interfere with its usefulness. This point must be determined before the work is begun, otherwise it may be found, after the expense has been assumed, that the looked for benefit is not forthcoming.

Bathroom coils heated by range boilers are quite common and give better service where properly installed than many of the kerosene and gas heaters and dwarfish stoves employed. They are cleanly and odorless, but the range and water back must be of liberal size and fired throughout the day to get good results. The accompanying sketches show the simplest kinds of piping arrangements, and they may be modified to suit conditions. In a circulating job, as shown in Fig. 1, the return circulating pipe may be made to serve as a return for the coil, thus saving one line of pipe. Some plain jobs may be easily changed into return circulation jobs when a coil is added to the work. In this way the plumbing service is improved in addition to utilizing the surplus heating capacity of the water back during the winter months. Pipe coils are used most because the room they occupy is usually least available for other purposes. "Pitched," or common open pattern return bends are used, the pitched fittings being confined to short coils because long pipes will spring either for "fall" or to permit making up with right hand threads. Ornamental fittings, wall plates and binders can be had if desired. There is little danger of getting a coil too large in a small bathroom. Six or eight straight 1-inch or ¾-inch pipes along the longest blank free wall space is the usual size.

A direct connection between the water back and the heating coil is shown in Fig. 2. The flow should enter the coil at the top, and have a valve to check the circulation where the flow enters the coil. A small hole drilled through the valve disk will prevent the coil from freezing should the valve be closed. An air cock should

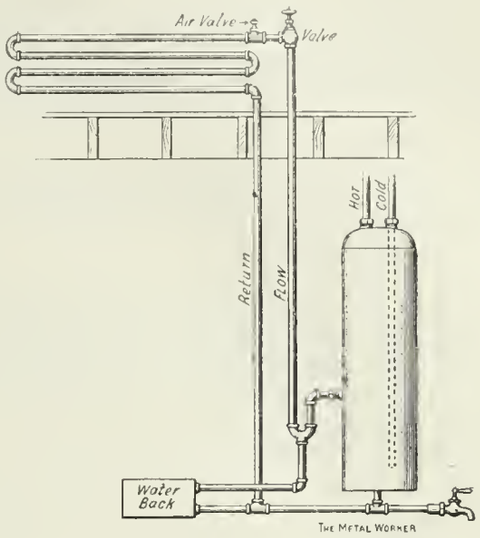


Fig. 2.—Direct Connection Between Water Back and Heating Coil.

be placed on the highest point of the coil to let the air out so that the coil will fill the water. The air cock should be opened from time to time to see that air is not impeding circulation. Air separates from water when heated, and enough may collect in the coil in this way to stop circulation.

Stop valves or cocks on both pipes are not usual, but may, if desired, be placed somewhere below the kitchen ceiling. Stop and waste cocks that will admit of draining the coil are best. These stops have nothing to do with the valve for controlling the circulation, before mentioned. It should be put in whether the stops are or not. Hot water radiators do as well as coils. A steam radiator will not answer for hot water, however; the circula-

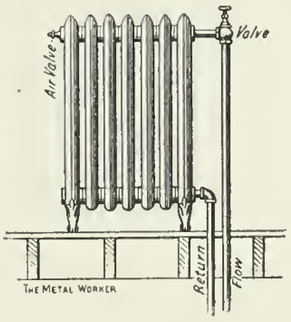

Fig. 3.—A Radiator Connection.

tion would be poor or fail entirely, and each loop would have to be provided with an air cock. A method of connecting is shown in Fig. 3, that will give excellent results, but a better looking job is made by using a regular hot water radiator and connecting the flow and return at opposite ends at the bottom.

New York City Notes.

The Campbell Supply Company of East Fifty-fourth street have opened a branch on Columbus avenue between Eighty-ninth and Ninetieth streets. This branch should do well and fill a long felt want in that vicinity.

* * *

The journeymen plumbers have at last got together, uniting as Local No. 2 of the United Association of Plumbers and Gas Fitters. At their meeting, held on the 16th inst., they voted to act as one body, doing away with the various councils which were a feature of the old Brotherhood.

The wage question is still unsettled, but many rumors are going around as to what will be asked, some going as high as $4.50. The Saturday half holiday and the doing away with apprentices and also with juniors after a certain time are features that are likely to be brought forward.

* * *

A few plans are passing through the Building Department, but most of them are for alterations. The trade still continues quiet, but many are waiting for their jobs to get up to the plumbing stage so that they can get to work.

* * *

John Boyd, who is one of the busy plumbers, is well along with his work in the Knox Building, at Fifth avenue and Fortieth street.

* * *

The members of the Irish Athletic Club presented their treasurer, T. J. Cummins, with a handsome gold badge, studded with emeralds and diamonds, on St. Patrick's Day as a testimonial of the hard work he has done for the club.

* * *

President A. H. Brown of Manhattan Branch has again been honored by a unanimous re-election as president of the village of Tarrytown, where he resides.

Heating and Plumbing Notes.

THE master plumbers of Dayton, Ohio, have either forestalled or invited trouble by posting notices in their various shops stating that on and after Monday, March 10, the establishments would be conducted as open shops, not nonunion, but open for nonunion and union men alike. It is said that the announcement, which is a great surprise to union plumbers, was brought about by the reported discontent of the men, and for the purpose of forestalling a possible strike.

THE BOARD OF EXAMINING PLUMBERS of Syracuse, N. Y., have organized, with Frank J. Schnauber, City Engineer, as president, F. W. Waggoner as secretary, and E. B. Dunkerton as a new member of the board.

JOHN CARNEY, a prominent plumber of Utica, N. Y., died at his home, 43 Cottage place, on March 10, aged 60 years. In 1871 he entered into partnership with his brother, P. H. Carney, in the Plumbing Supply business, in which he was engaged at the time of his death. He at one time served as alderman in the city, and was connected with a number of public enterprises. Twenty-five years ago he married Ellen Condon, who survives him with five children. He was prominently identified with St. Patrick's Church, having been its treasurer for 25 years.

THE headquarters of the English Acetylene Association are at 11 Ironmonger Lane, London, E. C., in charge of the secretary, Lacey Downes.

GEORGE SOULE, Billings, Mont., has been awarded a $6000 contract for plumbing and heating the residence of P. B. Moss, which is said to be one of the finest in Eastern Montana.

ERNEST G. BATES has resigned from the Board of Plumbing Examiners at Springfield, Mass.

JAMES W. BROWN, Fair Haven, Conn., has moved his plumbing business to one of the stores in the Chamberlain Building on East Grand avenue.

JOHN C. KUPFERLE, St. Louis, Mo., reports an excellent demand for his lines of Plumbers' Supplies and Hardware Specialties. He is enjoying an especially large business in Water Works Supplies this season.

THE English trade journals intimate a probability of trouble in the Sanitary Ware trade in that country, owing to a controversy over wages. The manufacturers have announced to the men their intention of cutting down wages as much as 25 per cent., and already some firms have made a reduction of from 7½ to 12½ per cent. on prices paid for the manufacturing of some of their goods. The men are resisting this reduction and have suggested to the manufacturers that a uniform scale of prices be agreed upon whereby the necessity for a reduction of wages will be removed. It is hoped that the dispute will be settled without any great disturbance of the trade.

A FIRE visited the plumbing establishment of F. A. Sheiderveiler, Corning, N. Y., last week.

THE team selected by Captain Emery to represent the Plumbing and Steam Supply League in the Business Men's Championship Bowling Tournament have already reflected credit to his judgment. The team met what is said to be the "crack-a-jacks" of the new league, and, although Captain Emery scored 214 and Secretary Wilson 205, yet the 819, 848 and 795 scored by the team, while very good, could not win against the 909, 855 and 845 of the Commercial League team. It was a good showing, however, and they will give a good account of themselves before the contest is closed.

A DISPLAY is being made at the New York office of Isaac A. Sheppard & Co. of Philadelphia, at Beekman street and Peck slip, of the Paragon Tank Heaters and Laundry Stoves. These Tank Heaters are made in a variety of styles and sizes adapted to heating from 65 to 300 gallons of water. The firm report an increasing demand for the Paragon line among the plumbers in the vicinity of New York. Their Laundry Stoves are made in a variety of styles adapted for heating from 10 to 28 sad irons. These Stoves are also equipped with Water Heaters of different capacities.

J. B. WEIANT, New Britain, Conn., is engaged in plumbing a house for Caspar Rowe. He also has the contract for plumbing several houses for Parker & Wetmore, a six-tenement block for Carlson & Torrell and some fine work in a house owned by Mr. Simms, at Kensington.

THE PIERCE, BUTLER & PIERCE MFG. COMPANY, Syracuse, N. Y., are sending to the trade a neat little pamphlet devoted to the Pierce Sanitary Wood Work, which shows, in addition to Flush Tanks in various styles for low down closets, Closet Seats. These are made of different kinds of wood in different finishes.

GEORGE H. STIBBS, Hartford, Conn., has recently installed new furnaces in the residences of J. D. Dillon and P. A. King in that city. He has also placed a furnace in the new opera house at Stafford, Conn.

THE authorities of Duluth, Minn., are considering the advisability of creating an office for the inspection of plumbing, as the result of a request coming from both house owners and plumbers, who urge that the health of the community may be endangered by neglect, which would be impossible under properly administered plumbing laws and inspection officers.

D. H. KELLY, Derby, Conn., bid $1745 and has been awarded the contract for heating and ventilating the new Franklin Street School in that city.

GEORGE C. MORRELL of the firm of Brown & Morrell presided as temporary chairman, and W. S. Washburn as secretary, at the meeting of the master plumbers of Brockton, Mass., on March 15, for the purpose of organizing a master plumbers' association.

FRITSCH BROTHERS, 174 Centre street, New York, who manufacture a variety of Thermometers adapted for the use of the heating trade, are sending out a catalogue giving illustrations and descriptions of their different Thermometers.

SMITH & COTTER, Springfield, Mass., are renovating the plumbing in a house on Greenwood street belonging to E. C. Fitzgerald.

A SUIT has been brought against the owner of a tenement building in Chicago for damages caused by the death of two children, said to be due to the escape of sewer gas from a faulty plumbing system.

C. L. WRIGHT & SON, New Haven, Conn., are drilling an artesian well for Joseph Kegelmeyer.

THE Plumbing Supply house of Fleck Brothers Company, 54, 56 and 58 North Fifth street, Philadelphia, are making extensive alterations in their showroom, which will be 25 x 75 feet in size and fitted with plaster columns, tiled wainscoting, tiled partitions and mosaic floors. It is the intention of the company to make it the handsomest plumbing showroom in the city.

H. W. Tombs, a well known Boston plumber, died at his residence in Cambridge on March 14. He was suddenly taken ill while riding in an electric car, and was taken to the Cambridge Hospital, where he died.

One of the features of the last issue of *Shop Talk*, issued by Hill, Clarke & Co. of Chicago, is a description and illustration of an electrically driven Pipe Threading and Cutting Machine. The machine is made by the Bignall & Keeler Mfg. Company of Edwardsville, Ill.

Fred. Adee & Co., 90 Beekman street, New York, are sending to the trade an illustrated circular showing their Defiance Water Closet with Zenith Valve. By the use of the Zenith Valve the necessity of flushing the tank is done away with, the closet being supplied with water from the regular service pipe, and it being only necessary to push a button to thoroughly flush the closet. It is claimed that the Zenith Valve is not affected by sand or grit in the water, and an investigation of it by the plumbing trade is invited by the manufacturers.

The new tube plant of the Eastern Tube Company, at Zanesville, Ohio, is in full operation, turning out about 400 tons of Pipe daily.

The Caldwell Furnace Company of Toledo, Ohio, have been reorganized and incorporated under the laws of New Jersey with $300,000 capital stock. The company have purchased a large foundry and furnace at Fort Payne, Ala., which have been consolidated under one head with the old Smead plant in Toledo. At the Toledo plant the company are manufacturing Blowers, Fans, Galvanized Pipes, as well as furnace castings. It is stated that both plants will be enlarged.

The Detroit Leather Specialty Company, Detroit, Mich., have just issued a finely printed, illustrated descriptive catalogue of what they call the "Wear Well" Leather Packings. These Packings are designed particularly for various kinds of hydraulic construction, and they undertake to follow a customer's specifications, giving, it is stated, perfectly formed Packings that fit and stand the Government test of 5000 pounds. In Cup Leather Packings they can furnish from 1 to 36 inches diameter inclusive, any sized center hole, and cupped to a depth of 3 inches.

The Incandescent Light & Stove Company, Cincinnati, Ohio, issue a booklet, entitled "Why are Gasoline Lighting Systems Persecuted by the Underwriters' Laboratory and the Committee on Fire Protection Engineering?" in which they point out that gasoline lighting systems, and especially their F.-P. Lighting System, are not more hazardous and are in many respects safer than gasoline devices which are permitted by insurance boards. The company challenge any one to show where a single accident has been caused from any source with 2000 incandescent Gas Machines built by them six years ago, and 4000 F.-P. Machines with safety escape pipe connected to the governor, which they have put out since March 1, of last year, all of which are said to embody the so-called hazardous features.

J. H. Edwards, 59 Park Place, New York City, has furnished us with a copy of the latest catalogue of the Aermotor Company, Chicago, Ill., of which he is the Eastern representative. The catalogue is a publication of 40 pages, profusely illustrated, and containing full description of the Aermotor Wind Mill, manufactured by the concern. The various features of this device are given at length, together with instructions for its erection, operation and preservation. Information regarding steel towers for Wind Mills is also provided, as well as a large amount of detailed information in regard to pumps and tanks for use with these Wind Mills. A table at the end of the book gives sizes of wheels, piping and cylinder for various depths of well. Mr. Edwards reports that the demand for the Aermotor in his district is constantly increasing and the outlook is favorable for a particularly large business in this line during the present year.

He: "Do you mean to say the plumber has not been here yet?"

She: "No—isn't it shameful? And we are such good customers; our plumbing is nearly always out of order!"—*Brooklyn Life.*

New Firms and Changes.

J. Frank Burt, formerly of the firm of Balman & Burt, Winchenden, Mass., has bought the stock, fixtures and business of G. F. Gilpatrick, at Wilton, N. H., and will conduct there a plumbing and tinsmithing business.

The Maryland Sanitary Refrigerating, Ventilating & Heating Company have been incorporated with a capital of $200,000 by Charles H. Basshor, David M. Newbold, William W. Varney, W. H. Wheedon and Marion De K. Smith.

F. A. Pipper, T. O. Bateman and H. L. Benson have incorporated the Texas Crude Oil Burner Company at San Antonio, Texas, with a capital stock of $50,000, to manufacture Crude Oil Burners for heat and light.

C. J. Arnold and Walter Howard of Pittsburgh, Pa., have purchased from Alfred Catchpole of Geneva, N. Y., his boiler and radiator patents and business and will retain him as consulting engineer.

B. A. Warlick & Co. are a new firm who are opening up a steam, hot water and hot air heating and sheet metal business at 79 and 81 Edgewood avenue, Atlanta, Ga. The firm say that they are in the market for machinery and materials in their line, and would also be glad of catalogues from manufacturers and jobbers.

The Moncrief Plumbing & Tinning Company, Jacksonville, Fla., have been incorporated with a capital of $10,000 by R. L. Moncrief, Jos. A. Schreiber and R. F. O'Shields.

The Hygienic Filter Supply Company of New Jersey, with office at 15 Exchange place, Jersey City, have been incorporated with a capital stock of $25,000 by William N. Winslow, Roswell H. King, William H. Ross, William H. Ross, Jr., and Robert L. Fleming, to manufacture Filtering Apparatus.

Tribus & Massa are a new firm of consulting civil and hydraulic engineers at 84 Warren street, New York, who make a specialty of the designing and construction of water supply, sewerage and water power systems. Louis L. Tribus, who has conducted a consulting engineering business at this address for a number of years, has associated Charles G. Massa with himself, owing to his public duties as Commissioner of Public Works for the Borough of Richmond. Mr. Massa is a graduate of the Columbia University School of Mines, class of '89, and has been engaged in the construction of railroads and water works.

Miller & Talbot succeed the firm of Hoey & Miller in the plumbing business at 202 East Bridge street, Grand Rapids, Mich.

Armstrong & Munger are a new firm in the plumbing and tinsmithing business at Hudson, Mich., Ralph Armstrong having sold a half interest in his business to C. D. Munger. The business will be conducted at the old stand of Mr. Armstrong on East Main street.

The Marshall-Cosby Company is the title of a new manufacturing concern in Port Huron, Mich., who will manufacture Plumbing Specialties. E. M. Marshall is said to be a leading spirit in the enterprise.

The Cold Air & Ventilation Company, with a capital of $1,000,000, have been organized at Pittsburgh, Pa., to introduce the invention of a Pittsburgh man for a system of furnishing cool air by the use of chemicals. He has been working on the plan several years, and claims he can undersell any ice company or refrigerating plant.

The J. A. Skelly Plumbing & Heating Company have been incorporated with a capital of $5000 at Wilkinsburg, Pa.

The American Warming & Ventilating Company have been incorporated at Pittsburgh, Pa., with a capital of $25,000.

The Huxley Valve Mfg. Company have been incorporated at Louisville, Ky., with a capital stock of $15,000, by Frederick Wahl, Chas. E. Huxley of Quincy, Ill., and Thomas L. Jefferson.

Short Calculations for Roofers.

BY I. N. PHILLIPS, NASHVILLE, TENN.

It very often happens in the regular routine of business that it is necessary to calculate the number of square feet in a length of valley, a number of sheets of corrugated iron, stamped siding, and the like, the width of which is in odd inches, and unless the workman is well up in decimals it is sometimes a little tedious to work out the operation according to the old time honored and orthodox way of reducing all to square inches and dividing by 144. For the benefit of those who are a little short on mathematics I send you a simpler method, which is accurate and easily remembered. The rule is: Multiply the length in feet by the width in inches, and divide by 12. The result is in square feet. Now the first thing that pops into the orthodox head on reading this rule is that if you multiply feet by inches you get neither square feet nor square inches, but a mongrel which is neither. I will not affirm nor deny, but leave the interested one to work out the solution, with the assurance that the rule is absolutely correct. Given a valley 257 feet long and 47 inches wide, find the number of square feet:

LONG METHOD.

257

It will be observed that there are 60 figures in the long method, and 37 in the short method, a saving of over 38 per cent. in figures, and presumably in time, which fact will probably appeal to our brethren of the strenuous persuasion.

Directions for Laying Felt Roofing.

The following directions for laying felt roofing are given in a pamphlet issued by Meurer Brothers Company of Brooklyn, N. Y., in the interests of their Meurer's felt roofing:

Have the roof smooth and free from obstructions. Sweep clean and lay the roofing with a slope. It may be laid parallel with the gutter, if desired. When laying parallel with the gutter, start at the bottom and work up; turn down about 1 inch over the edge and commence nailing at the middle, nailing both ways. Place the nails 2 inches apart on centers, about ¾ inch from the edge, using caps and lapping the next course 2 inches over the first. Cement well before nailing. Always lap the butts 4 inches, cement thoroughly and see that the nails and caps are thoroughly coated.

On roofs with a pitch of less than ¾ inch to the foot use a 3-inch lap on seams and 4-inch laps on butts as before. On the metal edge strips or wooden battens may be used in place of caps and nails. Use cement freely and see that the strips are well coated.

In the case of side walls, turn up the roofing about 3 inches; cement surface next the wall and secure with a wooden strip. Cement inside edge, taking special care with the seam next the wall. In case of chimneys, &c., turn up about 3 inches. Coat a separate strip of roofing to fit down over this, securing it at the top with a wooden strip, and cement well. When the roof is laid with a slope, half round wooden moldings may be substituted for caps and nails on the seams. Longer nails should be used, cementing as usual. Gutters may also be lined with felt roofing.

A HOPPER REGISTER BOX.

BY J. K.

Having been asked to explain what we meant by a hopper register box, as mentioned in our contribution in *The Metal Worker*, January 25, we present herewith an illustration, Fig. 1, and patterns of the hopper register box as we make it. It will at once be noted that the boxes, after the patterns are cut, are very easily made and are good goods to handle and show prospective customers when talking up work. It will be readily seen that the air starts to spread over the full surface of the register from the collar to the top of box, and there is nothing to interfere in any way with the register valves or a free outflow of the air.

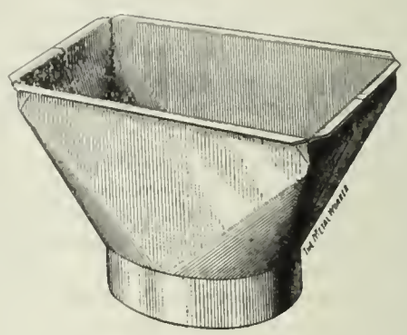

Fig. 1.—A Hopper Register Box.

We do not put this box forward as something entirely new, as we know of it being used by many good furnacemen for years. All we hope is that it may become much more commonly used, and prove to others, as it has to us, one of the little things that help to make the

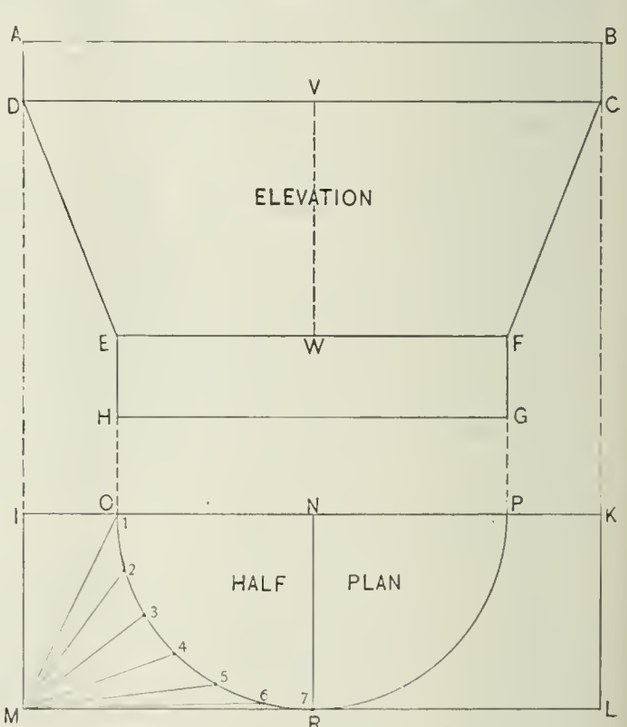

Fig. 2.—Plan and Elevation.

warm air furnace a success and sought after by those who really want something good.

The way we get the patterns for this box is a simple problem in triangulation, and we would advise using this method in getting out the patterns for all stock sizes at least. The hopper is shown in elevation by A B C F E D in Fig 2. The top square part made to receive the register is represented by A B C D, the hopper proper by D C F E, and the round collar at the bottom of the hopper, to which is fitted the hot air pipe, by E F G H. The half plan of the top of the hopper is represented by I K L M and the half plan of the round bottom part by O R P. To find the pattern of the hopper, D C F E, and the top square part, A B C D,

which are made in one piece, divide the quadrant O R into any number of equal spaces, as shown by the figures 1, 2, 3, 4, 5, 6 and 7. From the point M draw the lines M 1, M 2, M 3, M 4, M 5 and M 6, which show the horizontal distances between the point represented by M in plan and D in elevation and the points on the quadrant.

To find the true distances between this point and the points on the quadrant draw in Fig. 3 the base line T U. At T erect the perpendicular T S, equal to the vertical distances between D C and E F in Fig. 2.

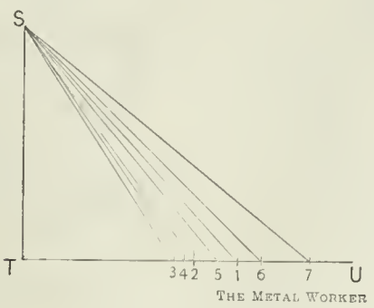

Fig. 3.—Diagram of Triangles.

From T on the line T U lay off the horizontal distances between M and the points on the quadrant, making T 1 equal to M 1, T 2 equal to M 2, &c. From the numbered points thus obtained on the line T U draw lines to S. These lines will represent the true distances from M in plan, which is the same as D in elevation, to the numbered points on the quadrant O R in plan, which is E W in elevation.

To make the pattern as shown in Fig. 4 draw A′ B′ C′ D′ equal to A B C D in Fig. 2 It will be seen from the plan in Fig. 2 that the line L M and the point 7 of the arc O R P meet at R, so that the vertical distance between the points V and W in Fig. 2 is equal to the actual distance between these lines. Therefore, in Fig. 4 let fall from the center of C′ D′ a perpendicular whose length is equal to V W, the vertical distance between D C and E H in Fig. 2, and call the bottom point of the line 7′. Now from 7′, with a radius equal to one of the spaces on the quadrant O R in Fig. 2, strike arcs, and from D′ and C′, with a radius equal to S 6 in Fig. 3, draw arcs intersecting these, marking the intersections 6′. From the points 6′ strike arcs with a radius equal to the spaces in the quadrant in Fig. 2, and intersect these with arcs whose centers are D′ and C′, and which have a radius equal to S 5 in Fig. 3, calling these points 5′. Proceed in a similar manner until points 1′ are reached. Trace a curve through the points thus obtained.

From D′ and C′ in Fig. 4 strike arcs equal to I M in half plan in Fig. 2 and intersect these with arcs struck from 1′, with a radius equal to D E in Fig. 2, calling the intersections D″ and C″. Draw the lines D″ D′ and C′ C″. From the points D″, D′, C′ and C″ erect perpendiculars equal to A D in Fig. 2, and connect the top of these perpendiculars, so as to form the rectangles A‴ A″ D′ D″ and C′ B″ B‴ C″. Draw the lines D″ 1′ and C″ 1′. Then will the figure A‴ A″ D′ A′ B′ C′ B″ B‴ 1′ 7′ 1′ be the pattern for half the hopper, no allowance being made for laps.

Attention is called to the way that the joints on the square top of the hopper are made, as shown in Fig. 1, and also to the floor flange which has been provided and which is an essential part of the hopper. It is usual to make the square box to receive the register about 2 inches deep. After forming up and grooving a collar is put on the bottom of the box, as shown in Fig. 1.

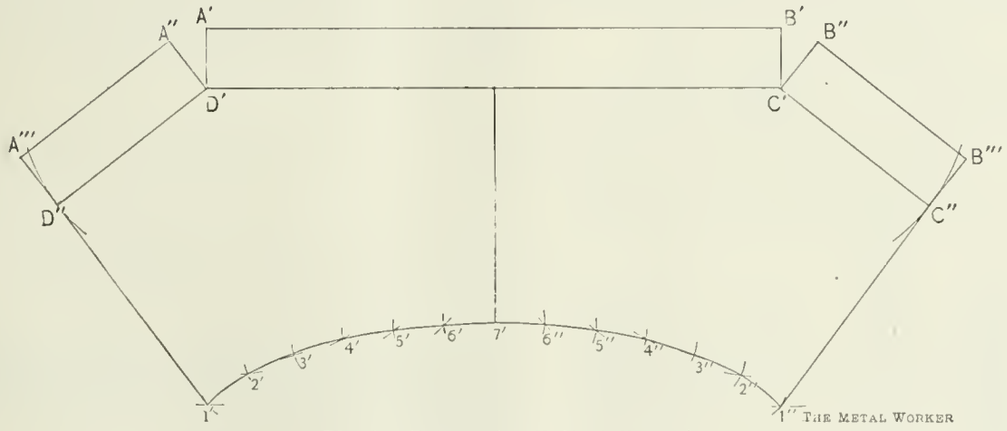

Fig. 4.—Pattern for Half of Hopper.

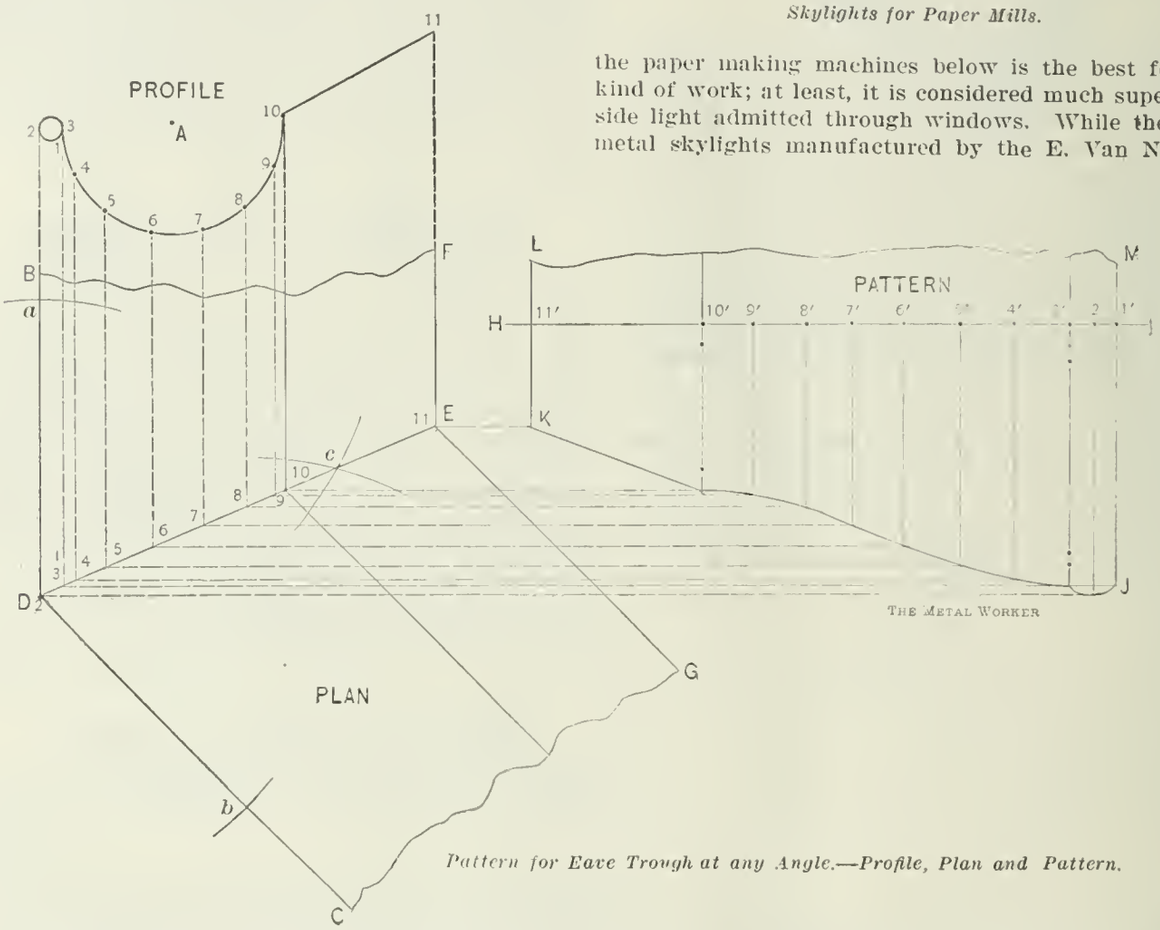
SHEET MILL WAGE AGREEMENT.

At a meeting of officials of the American Sheet Steel Company and representatives of the Amalgamated Association of Iron, Steel and Tin Workers, held in the Vandergrift Building last week, an arrangement for a continuous sheet wage scale was made. The present scale expires June 30, but under the terms of the contract made last week there will be no stop of work pending the formation of a new wage scale, should one not be agreed upon by the time the present scale expires. The agreement is something similar to that recently made between the Amalgamated Association and the American Tin Plate Company, and insures steady work in the sheet mills through the summer months. The agreement will have to be ratified by the Amalgamated Association at their convention in Wheeling in May, but no trouble is expected on this score.

The Empire Iron & Steel Company.



The Empire Iron & Steel Company have been organized and will build a plant at Niles, Ohio, for the manufacture of iron and steel sheets. The concern have secured 15 acres of land at Niles and will probably buy 15 acres more. The promoters of the company are Wade A. Taylor of Niles, Charles S. Thomas of Struthers and Jno. F. Odea of Youngstown. The initial plant will consist of four sheet mills and a bar mill, as it is the intention of the concern to roll their own bars. A galvanizing plant will also be erected to make galvanized sheets. The new concern will also roll small sections of T rails and state the rail mill will have an output of about 100 tons in 24 hours. Chas. S. Thomas was secretary of the Struthers Iron & Steel Company until the formation of the American Sheet Steel Company, since which time he has been manager of the Struthers Works of this concern.

It is considered that the question of payment by area is likely to be the chief doubtful factor in the renewal of the wage scale in the Welsh Tin Plate trade this year. Some Tin Plate workers in South Wales are paid by weight, with special rates for light plates, while the majority are paid by area. The workingmen's union, at a recent meeting, decided that the proper time had come to arrange for a uniform system of payment by area in all the Welsh Tin Plate mills.

PATTERN FOR EAVE TROUGH AT ANY ANGLE.

With the coming of the spring months eave troughs will be required on many buildings, owing to ice having damaged the old ones. In making the troughs a large bead of ½ inch diameter is usually placed on the outer edge and a flange to run up under the shingles or slates on the roof side. In some cases the troughs are beaded on both sides and hang directly under the eaves. However, no matter what the shape of the trough may be or whatever angle the building has, the pattern is obtained as shown in the accompanying diagram.

Let A represent the profile of the trough which is to run around the building, having an angle equal to B D C in plan. The first step required is to obtain the miter line D E by bisecting the angle B D C, as follows: With D as center and any radius describe arcs, intersecting B D and D C at *a* and *b*, respectively. Then, using *a* and *b* as centers and any radius more than *b* D in length, describe arcs intersecting each other at *c*. Draw a line from D to *c*, extending it to E, which is obtained from the point 11 in the profile. Draw the line E G parallel

Pattern for Eave Trough at any Angle.—Profile, Plan and Pattern.

to D C. Then will F E G C D B be the part plan. In this manner the miter line is obtained, no matter what angle the plan has.

For the pattern proceed as follows: Divide the profile A, including the bead, into equal spaces, as shown by the small figures 1 to 11. From these intersections, and parallel to B D in plan, drop lines, intersecting the miter line D E, as shown. Now at right angles to F E draw any line, as H I, upon which place the stretchout of the profile A, as shown by the small figures 1′ to 11′. At right angles to H I, and through these small figures, draw lines, which intersect with lines drawn at right angles to F E from intersections having similar numbers on the miter line D E. Trace a line through the points thus obtained, as shown by J. K. Then will L M J K be the desired pattern.

THE TOLEDO MACHINE & TOOL COMPANY, Toledo, Ohio, are completing a shipment of 12 carloads of Punch Presses for the equipment of a large manufacturing plant in England. The company report a heavy demand for machinery and expect a large business during the coming year.

Van Noorden Skylights.

It is a well-known fact that good light is required in buildings where paper is manufactured, and it is generally conceded that overhead daylight diffused on

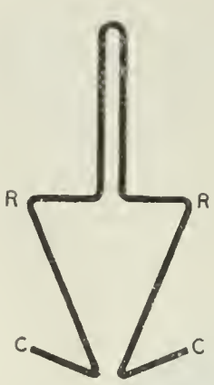


Fig. 1.—Shape of Bar as Formed in Press.

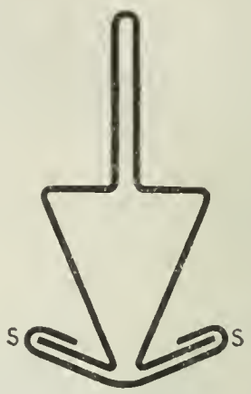

Fig. 2.—Showing Extra Strip for Clamping the Bar.

Skylights for Paper Mills.

the paper making machines below is the best for this kind of work; at least, it is considered much superior to side light admitted through windows. While the sheet metal skylights manufactured by the E. Van Noorden Company of 944 Massachusetts avenue, Boston, Mass., are especially adapted for the needs of buildings in which paper is manufactured, they will also be found

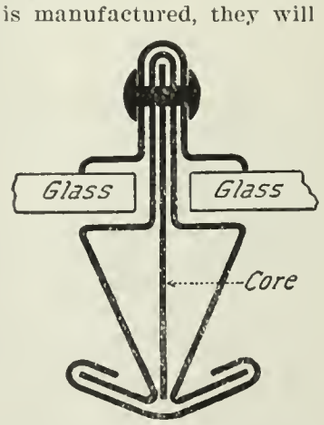

Fig. 3.—Showing the Core to Give Greater Rigidity in Case of Long Spans.

adapted to other kinds of structures. The claim is made that the Van Noorden skylight bar, being formed of a

strip of flat sheet metal, bent up by dies in a 10-foot press in the shape indicated in Fig. 1, presents a construction which permits of the water of condensation being carried off, instead of allowing it to drop down on the contents of the room in which the skylight may be placed. Referring to the engraving, C C are the condensation gutters and R R the rabbets or resting places for the glass. An extra strip, S S, is put on to clamp the bar together, as indicated in Fig. 2. When the bars stretch over a long span a sheet metal core is inserted internally, all as clearly indicated in Fig. 3 of the illustrations. This, it is claimed, adds greatly to the rigidity and strength of the bar. The glass is bedded in putty and capped with sheet metal, as shown. The bars are mounted on a base which carries a main internal gutter, and into which empty all the gutters of the bars. The water is then carried outside through holes in the double wall of the base. This system has been employed by the company with great success, and has been used in paper mills, as well as other kinds of manufactories, public buildings and residences throughout a large section of the country. The company have issued a catalogue containing 40 pages, fully illustrated, relating to their skylights, and we understand a copy will be sent free to any address on application.

FLASHINGS.

A REPORT from Blairsville, Pa., states that a site is being sought at that place for a 10-mill Tin Plate plant, of which A. E. Piper, formerly superintendent of the Star Tin mill at Pittsburgh, will be the manager.

THE NEW JERSEY ZINC COMPANY are making a number of extensions and additions to their large plant at Hazard, Pa., including an addition of 50 feet to the foundry, 96 new oxide furnaces, and a rolling mill to make Sheet Zinc; also new storage house and blacksmith shop. At present the concern are making only Bar Zinc. They employ between 300 and 400 men, but this number will shortly be largely increased.

THE six-mill plant of the American Tin Plate Company at Atlanta, Ind., is being dismantled. Three of the mills have been removed to Elwood and will be added to the company's large plant at that place.

THE HULLS KEY CAN COMPANY have been incorporated in New Jersey with a capital of $125,000 to manufacture Tin Cans, &c. The incorporators are: W. C. Stubbs, A. C. Yates, C. G. Leavenworth and P. A. Neales, Jr.

JOHN STEVENS, superintendent of the Midland plant of the American Sheet Steel Company at Muncie, Ind., has resigned in order to accept a similar position with the Inland Steel Company.

J. E. LAUCK, formerly manager of the United States works of the American Tin Plate Company at Demmler, Pa., has been appointed manager of the new works of the McKeesport Tin Plate Company at McKeesport, Pa.

THE WHEELING CORRUGATING COMPANY, Wheeling, W. Va., announce that they have removed their Philadelphia office from their old quarters to 402-406 Race street, where, owing to increased warehouse facilities, they will be enabled to carry a full and well assorted stock of all the goods of their manufacture, including Roofing Plates, Bright Tin Plates, Black and Galvanized Sheets, Steel Roofing and Siding, Eave Trough, Conductor Pipe and Fittings, Valleys and Gutters, Steel Ceilings and Side Walls, Steel Lath, Solder, Rivets, Nails and other Tinners' and Roofers' Supplies.

AUSTIN & WOODRUFF, Waterbury, Conn., have the contract for placing Metal Ceilings, &c., in a store in the Platt Building for A. W. Woolworth & Co.

THE GENERAL METAL ROLLING MACHINE & MFG. COMPANY, 26 Clinton avenue, Newark, N. J., have been incorporated with a capital of $125,000 to manufacture Metal Rolling Machines. The incorporators are: Warren Clouse, John R. Taylor and John H. Lotsch.

THE JUDGE & LELAND MFG. COMPANY of Clifton Springs, N. Y., have been incorporated with a capital of $75,000 to manufacture Tin and Sheet Iron Goods.

PETER DONLY, Bridgeton, N. J., who is engaged in the roofing business, is contemplating the erection of a factory for the manufacture of Roofing Materials. He will put in rolling machinery and make his own Felt Paper. Mr. Donly claims to make the only Paint that will stand on the tanks used in the Dupont Powder Works.

THE statement is made by workmen in Western rolling mills and steel works that if T. G. Shaffer is re-elected president of the Amalgamated Association of Iron, Steel and Tin Workers at the convention to be held at Wheeling, W. Va., next month a rival association will be organized. The proposed association will include the mills at South Chicago and Joliet, in Illinois; Milwaukee, Wis., and several others. The workmen in these mills are greatly dissatisfied at the course pursued by President Shaffer last summer in breaking the agreement made for the year, and they do not propose to belong to an organization controlled by him.

THE WATERLOO CORNICE WORKS, Waterloo, Iowa, are desirous of finding out the present whereabouts of Paul Fink, a Cornice maker, who was last heard from at Pullman, Ill., in 1901; also of R. Natre, a Cornice maker, who was working in Dayton, Ohio, last year. These men are asked to communicate with the above named concern.

The Norton Grinding Company.

The Norton Grinding Company of Worcester, Mass., are about to build a new machine shop at Barber's Crossing, for the manufacture of heavy plain grinding machines, for which the company were organized. The business is now conducted in the machine shops of the Norton Emery Wheel Company, with whom the Norton Grinding Company are intimately associated. The new grinding shop will be located near this plant, which will be 150 x 80 feet on the ground and two stories in hight. The main room in the shop will extend to the turret roof, but all around this room, at the second story, a gallery will extend in which lighter tools will be located. The shop will be equipped with every modern convenience, including electric traveling cranes, and a number of special new tools have been ordered. A spur from the Boston & Maine Railroad will provide the plant with excellent shipping facilities.

The World's Production of Spelter.

We are indebted to the American Metal Company of New York for a copy of the statement of the production of spelter in the world, compiled by Henry R. Merton & Co., Limited, metal merchants, of London. The statistics of the production of spelter for the United States were collected by the American Metal Company:

	1901. Tons.	1900. Tons.	1899. Tons.	1890. Tons.
Rhine, Belgium and Holland	199,285	186,320	189,955	137,630
Silesia	106,385	100,705	98,590	87,475
Great Britain	29,190	29,830	31,715	29,145
France and Spain	27,265	30,620	32,955	18,240
Austria and Italy	7,700	6,975	7,190	7,135
Poland	5,935	5,875	6,225	3,620
	375,760	360,325	366,630	283,245
United States of America	122,830	110,465	115,855	59,371
Totals	498,590	470,790	482,485	342,616

It will be observed that our percentage of the world's total production has risen from 17.3 per cent. in 1890 to 24.6 per cent. in 1901.

Nelson M. Beach, treasurer and general manager of the Bridgeport Brass Company, died suddenly of heart disease on March 19 at his home in Bridgeport, Conn. He was born in Derby, Conn., 48 years ago, and as a boy entered the employ of the Bridgeport Brass Company. He leaves a widow and two sons.

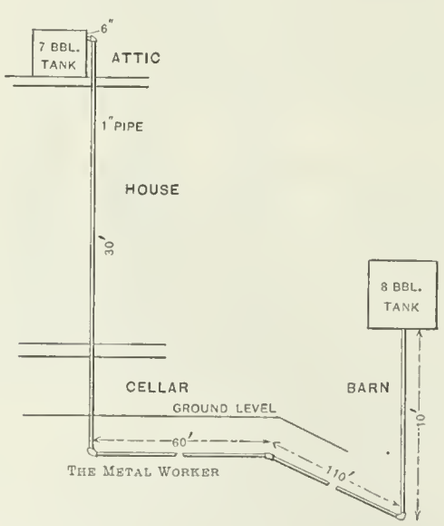
THE DEMING COMPANY of Salem, Ohio, manufacturers of Pumps and Hydraulic Machinery, have of late experienced such an increase in the amount of their Pump business that they have been hampered for foundry room. They are preparing plans for an addition 60 x 80 feet. Heretofore they have sent much of their heavy work to other foundries, but will now do all their own work in this line.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

NAMES AND ADDRESSES INDISPENSABLE.



In the past we have been somewhat indulgent in presenting, at times, the inquiries of correspondents who have withheld their names and addresses. The necessity of having this information led to placing at the head of the Letter Box the request that correspondents in all cases give their names and addresses, not for publication but for our own information. This stipulation has recently been ignored by quite a number of correspondents. We are glad to accord to our readers all the assistance that may be derived through the presentation of their problems in the Letter Box, but at the same time must insist that their contributions be signed with their full name and address, which will not, of course, be printed without their consent.

At the present time we have before us a communication signed "A Constant Reader, New York," asking about skylight bars and marking ink for galvanized iron. If this correspondent will send his full name and address we will gladly present his inquiries in the Letter Box for the consideration of our readers.

From another correspondent, who signs himself "Retailer, Conn.," we have received a letter stating that the plumbing supply trade are encroaching upon the rights of the master plumbers in his section, by furnishing goods to those who are not engaged in the trade. We shall be glad to give this correspondent's views due consideration if he will comply with the conditions as given above.

ARE THE PIPES AIR BOUND?

From E. J. F., Kendall, N. Y.—I seldom ask questions of *The Metal Worker*, although I have been a subscriber to the paper for 18 years, and have always enjoyed reading it. However, I desire now to ask two questions, although the answer to one will probably

Are the Pipes Air Bound?—Fig. 1.—Showing the Piping System.

cover both. I put up a wind mill for a customer last fall and located a tank in the attic of his house, as shown by the diagram in Fig. 1. This tank is 3½ x 4 feet and 4 feet deep. I ran an overflow pipe from this tank to a tank in the barn, as shown. The water, however, does not discharge into the barn tank through the pipe for some time and not until the wind mill has pumped the tank so full that it runs over. The pipe is not stopped up, but is connected with the tank 6 inches below the top. There is at least 20 feet difference in hight between the discharge pipe at the barn and the bend where the pipe connects with the house tank. I think that air must accumulate in the horizontal pipe, but do not see how to remedy it. It is laid about 3 feet in the ground and runs 170 feet. The pipe is 1 inch in diameter, and if the water runs through it as it should it would take care of double the amount of water that the wind mill would pump. I know this, as I have arranged several tanks in a similar way which work perfectly. The foot of the pipe in the cellar is a foot lower than at the elbow where the pipe rises to the tank in the barn, and when it was laid care was taken to preserve an even pitch throughout the entire length.

In the other job that is giving trouble, shown in Fig. 2, a ½-inch telltale pipe leads from the tank down to the cellar, where it runs about 6 feet horizontally and

Fig. 2.—The Second Troublesome Piping.

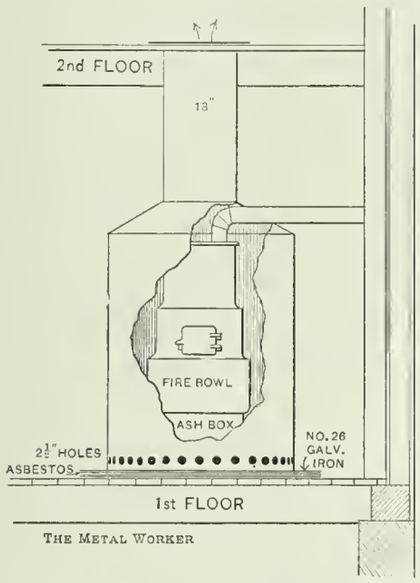
then turns up through the floor to a sink, so that it can be known when the tank is full by the flow of water from the telltale pipe in the sink. Water will not run through this pipe until it has risen in the tank several inches above the outlet, although in a short time it then runs fast enough, but it does not start soon enough to warn the person in charge of the pump, and if a careful watch is not observed the tank is liable to be pumped too full.

Note.—We hope that our readers will lend their assistance to our correspondent in his difficulty. Meanwhile, we would suggest that the pitch of the outlet pipe at the tank be investigated. In some cases that have been discussed in *The Metal Worker* the outlet pipe has had a pitch upward so that the pipe was air bound at the start, and the few inches that the water rose in the tank above the outlet did not afford sufficient pressure to dislodge the air. If this is the cause of the trouble the difficulty can be overcome by using a tee instead of an elbow, and running a short pipe up above the top of the tank. If the trouble is due to the pipe in the ground becoming air bound, the immediate cause of the trouble can be removed by means of a force pump, but it will recur unless the pipe is straightened so that there will be no kinks in it where the air can lodge.

WILL METALS MELT IN BOILING WATER?

From W. H. F., Washington Depot, Conn.—Will you kindly inform me through the Letter Box if the alloy of bismuth, lead and tin, known as Rose's metal, will melt in boiling water; or if any metal, the melting point of which is below 212 degrees, will melt in water at that temperature or higher?

Answer.—There are two alloys called Rose's metal, one of which is composed of one part each of lead and tin and two parts of bismuth by weight. This melts at 201 degrees F., and will melt in water before it boils. Another alloy called by the name of Rose's metal is composed of eight parts of lead, three parts of tin and eight parts of bismuth by weight. This melts at 174 degrees F. Any alloy having a melting point at or below 212 degrees F. will melt in boiling water with the barometer at 30 inches. High altitudes make a lower degree of boiling for water; therefore, differences in barometric pressure from any cause may prevent alloys with melting points at or near 212 degrees from melting.



PATTERN FOR ELBOW SPRINGING FROM PIPE.

From C. L. M., Kansas City, Mo.—Will you please explain how to obtain a correct pattern for an elbow of any number of pieces springing from a vertical pipe whose diameter is greater than the diameter of the elbow?

Answer.—On page 55 of *The Metal Worker* of October 26, 1901, is shown the method of obtaining the pattern for an elbow springing from a pipe, when the elbow is placed in the center of the vertical pipe. This is exactly what our correspondent requires. Should the patterns be desired for an elbow placed at one side of the center of the vertical pipe, they can be found on page 45 in *The Metal Worker* of February 15, 1902. The principles there given can be applied to any size of pipe or elbow.

WHAT CAUSED THE FIRE?

From J. B. E., Cincinnati, Ohio.—The drawing presented herewith shows a stove having a 24-inch fire pot placed inside of a galvanized sheet iron casing 44 inches in diameter. The casing has a large door in the front so that the fire can be replenished with coal and ashes can be removed. Around the bottom of the casing there is a row of 2½-inch holes punched 2 inches apart. From the top of the casing a single pipe, 18 inches in diameter, runs up to a register face placed in the floor above,

What Caused the Fire?

which is only a register face, there being no valves connected with it. Underneath the stove, extending 6 inches all around, the floor was covered with No. 26 sheet iron under which were three layers of asbestos paper. The floor underneath was made of tongued and grooved flooring, making it perfectly air tight. From the bottom of the grate in the stove to the floor is 14 inches. There were no cracks or holes in the bottom of the stove, and there were about 2 inches of ashes in the ash box, yet under these conditions the building caught fire underneath the stove. The sheet iron was removed, which showed that the fire burned through the floor. It should be remembered that the hot air pipe from the top of the stove was 18 inches in diameter, and the register face of ample size to allow the hot air to pass through. On the inside of the casing on the floor was a small quantity of soft coal, yet this did not ignite. Can you or any of the readers of *The Metal Worker* explain why the floor caught fire? An explanation of the cause would confer a particular favor at this time.

Note.—We shall be glad if our readers will give their views on this subject. In the meantime we would remark that every necessary precaution to prevent a fire seems to have been taken. The cut shows the stove setting up on legs so that the bottom of the ash pit, even if covered with hot ashes, would hardly send down heat enough to ignite the flooring underneath so much insulating material. That some warmth might be imparted is probable. It is also possible that the frequent warming and cooling of the flooring may have been conducive to spontaneous combustion.

TO REMOVE LIME FROM LEAD PIPE.

From M. & P., Kinston, N. C.—Will you please tell us what will remove crystals from lead pipe running from urinals? There seems to be a coating of hard substance on the inside of the pipe. Is there any solution that will remove this and not hurt the pipe?

Answer.—A solution of sulphuric acid and water—four parts water and one part acid—thrown into the urinal, a little at a time, will dissolve the lime incrustation in a short time. If the lead pipe can be closed at the outlet, it can be filled with the solution for a short time with good effect. Strong lye or potash has been used for cleaning urinal pipes, and placing pieces of soap in the bowls is also useful for this purpose.

NEEDS A PRESSURE REGULATOR OR TANK.

From G. A. H., Canaseraga, N. Y.—Our water system here gives a pressure of 99 pounds. Can we reduce the pressure on hot water boilers so as to make them last longer, by keeping the faucet connecting the supply with the boiler nearly closed, or open just enough to keep up the flow?

Answer.—The adjustment of the stop cock will not have the effect of reducing the pressure. It would only adjust the supply when the faucets were open. The pressure can be reduced by means of a regulator attached to the supply pipe, either placing it in the cellar so as to reduce the pressure on the whole plumbing system, or connecting it with the supply pipe to the boiler where it connects with the boiler. These regulators are made so that they can be adjusted to any pressure desired, and they can be procured from any supply house. Another method of avoiding excessive pressure is to locate a tank at the highest part of the building, with a ball cock upon it, so that it will not overflow. Connect this tank with the boiler supply, then the boiler will only be subjected to the pressure that will be due to the hight of the tank above it.

RETINNING COPPER WARE.

From I. E. D., Atlantic, Iowa.—Having read the article on "Retinning Copper Ware" in the Letter Box of March 15, I notice that the writer does not say in what shape his bar tin is when he applies it to the article to be tinned. I have done some retinning and use about the same proportions recommended by the writer, but with this difference: I take my block tin and melt it in a ladle and pour it in a cloth, holding the four corners in my hand, then by jarring it down on the bench while it is cooling I have the metal in very fine particles, so that it can be applied with better control than by melting it off the bar on the work to be tinned.

A Novel Steam Boiler.

An English engineer, says *Popular Mechanics*, has designed a steam boiler made up mainly of coils of steel tubing. The great objection to this kind of boiler hitherto has been that the generation of steam is very irregular and the coil is liable to become choked with deposit from the water. To get rid of these disadvantages the inventor has designed a coil boiler, into which he places small balls which can move freely in the tube for a short distance. These, by checking the flow of water through the lower coils of the tube, permit the steam to come off more quietly, and the violent production of steam, so common with this type of boiler, is prevented. As the balls are in constant movement, all scale and deposit are cleared away, and the tube is thus kept much longer in working order than it otherwise would be. The boiler is intended for use in automobiles and steam launches.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull, with spot held at high figures.

Copper is extremely quiet and rather weaker.

Pig Lead continues dull and firm.

Spelter is quiet, but very firm in price.

Antimony shows no change.

Nickel is in good demand at former prices.

Aluminum is active and without change.

Tin Plates are quiet, with prices firm and unchanged.

Sheets continue in heavy demand, and prices are strong with upward tendency.

Scrap Iron is very active and firm.

Scrap Brass and Copper are strong and higher.

Foundry Iron is scarce and high in price.

Sheet Copper is in good demand and firm.

Sheet Zinc is unchanged.

Hardware is in excellent demand, and prices well maintained.

Nuts, Cold Punched and Hot Pressed, have been again marked up in price.

Egg Beaters have been advanced in price.

Pumps are in active demand with some uneasiness in prices.

Stove Boards are selling well with prices very strong.

Wire Nails are scarce and firm.

Cut Nails are in fair demand at former prices.

Window Glass has been advanced in price.

White Lead is firm and in better demand.

Linseed Oil is firm and unchanged.

Spirits Turpentine has advanced 3 cents a gallon.

Wrought Iron Pipe has been again advanced in price.

Galvanized Range Boilers are likely to advance in price.

METAL MARKET.

NEW YORK, March 21, 1902.

Pig Tin.—While the price of Spot Tin has been maintained, and has even been advanced since last week, these prices are purely artificial. The spot supply of Pig Tin is said to be under close control. Business throughout the week was of the very slowest nature. Consumers are still buying very sparingly. Practically nothing is doing in futures, although they are considerably below spot prices. Straits Pig, in small lots, is quoted by jobbers at 27½c to 28c. per lb.

Copper.—The market has fallen back into a dull and uninteresting condition. Everything is extremely quiet and the market is in the buyers' favor. Purchasers are not showing themselves, however, as there is a prevalent belief that prices will go lower. The larger consumers are said to be still well supplied and smaller users are buying only in a retail way, according to the dictates of their immediate requirements. Prices are largely nominal. Jobbers quote Lake Ingot in small lots at about 13¼c. to 13¾c. per lb., and Casting Copper at about 13c. to 13¼c. Exports continue on a very large scale. Thus far this month they have amounted to 12,600 tons, and it is expected that for the entire month exports will reach fully 18,000 to 20,000 tons. These heavy shipments are attributed entirely to the covering of previous sales.

John Stanton reports Copper production in the United States and United States exports as follows, in gross tons of 2240 lbs.:

	Reporting mines.	Outside sources.	Total U. S. product.	U. S. exports.
First half 1899.....	111,987	12,500	124,487	56,460
Second half 1899....	118,818	18,900	137,719	63,351
Total 1899.....	230,806	31,400	262,206	119,811
First half 1900.....	114,177	20,400	134,577	90,747
Second half 1900....	113,810	20,400	134,104	69,335
Total 1900.....	227,987	40,800	268,681	160,082
First half 1901.....	112,794	20,600	133,394	50,027
Second half 1901....	110,561	21,300	131,861	44,539
January, 1902.....	15,155	3,800	18,955	15,021
February, 1902.....	16,931	3,400	20,331	16,108

Sheet Copper.—The movement in Sheet Copper is still of good proportions, the consumptive demand being active, and the outlook favorable for a continuance of the present activity in the future. Prices are firm on the basis of 18c. per lb. from store.

Pig Lead.—No change is to be noted in the Pig Lead situation. The demand is light, and business generally very poor. Prices, however, are steady. American Pig in small lots being quoted at about 4.45c. to 4½c. per lb. St. Louis advices report a quiet but firm market, and prices without much variation.

Spelter.—Business in Spelter is said to be still rather light. The tone of the market has improved materially, however, and wholesale prices have advanced. Jobbers quote Western brands in small lots at 4.60c. to 4.70c. per lb. St. Louis advices report the market for Spelter as firm and quiet, although the volume of business has not been large. At the same time offerings are quite light.

Sheet Zinc.—A fair demand for Sheet Zinc is reported, and prices are unchanged at 6¾c. per lb. for 600-lb. cask lots, and 7c. to 7¼c. for smaller quantities.

Antimony.—This metal is without change. Hallett's is quoted at 8⅝c. to 8¾c. per lb. in small parcels; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—No change has taken place in this market. Small lots are quoted at about 55c. per lb.

Aluminum.—There is no change either in price or in the volume of business, which continues good. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market is unchanged in any respect from the conditions reported for the last few weeks, and is quite devoid of interesting features. Deliveries from mills are said to be large in volume, but are almost exclusively on old contracts. Retail business has been rather quiet, owing to unfavorable weather conditions early in the week. Prices remain firm and unchanged. American Bessemer Coke Plates, IC, 14 x 20, in small lots are selling at about $4.85 to $5 per box at New York and corresponding points.

Sheets.—A large number of orders for both Black and Galvanized Sheets are still coming into the mills, which, as a rule, are filled up for the next two or three months. The heavier gauges are particularly active, and it is said that Black Sheets running from 10 to 14 gauge have been imported. The outlook favors a very heavy demand during the spring and summer months, with prospects of a sharp scarcity in the supply. It is this contingency, perhaps, which stimulates consumers in placing their orders at this time to cover future needs. Prices while very firm are no higher. Jobbers quote No. 27 one pass cold rolled Soft Steel Sheets, in small lots, delivered at New York or corresponding points, at about 3.90c. to 4c., and Galvanized Sheets at 67½ and 5 per cent. to 70 per cent. off the list.

Chicago advices are as follows: A large volume of business is reported in Galvanized Sheets, but the demand for Black Sheets is not specially heavy, although even on the latter the mills are not in any case promising earlier than three weeks' delivery. Continued scarcity is noted in 10 to 14 gauge. Jobbers quote small lots at 3.35c. to 3.45c. for No. 27 Black, and 70 and 5 for Galvanized.

Old Metals.—There is an active demand for Scrap Iron of all kinds that absorbs about all the material offered in the market and prices rule very strong. Scrap Brass and Copper, also, are active and firm. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....per lb. 11¼c.
Light and Tinned Copper.....per lb. 10 c.

Heavy Brass	per lb.	8¾c.
Light Brass	per lb.	6½c.
Lead	per lb.	3¾c.
Tea Lead	per lb.	3⅝c.
Zinc	per lb.	3 c.
Pure Aluminum Sheet	per lb.	25 c.
Cast Aluminum	per lb.	20 c.
No. 1 Pewter	per lb.	15¾c.
No. 2 Pewter	per lb.	9 c.
Tin Plate Scrap, per gross ton		.... to $5.00
Wrought Iron Scrap, per gross ton		$13.50 to 14.00
Heavy Cast Scrap, per gross ton		12.50 to 13.00
Stove Plate Scrap, per gross ton		9.50 to 10.00
Burnt Iron, per gross ton		7.50 to 8.00

THE PIG IRON MARKET.

NEW YORK.—It is becoming increasingly difficult to quote the market, since everything depends upon the deliveries and the necessities of the buyer. As a rule the quantities required for urgent delivery are small, but as high as $21 and $22 has been paid at New England points. Some fair sized sales have been made for forward delivery. Some Scotch Iron has been bought for importation, but the quantity thus far is small. We quote for forward delivery, Northern Irons: No. 1, $19.25 to $19.75; No. 2 X, $18.25 to $18.75; No. 2 Plain, $17.75 to $18.25; Tennessee and Alabama brands, No. 1 Foundry, $16.75 to $17; No. 2 Foundry, $16.25 to $16.75; No. 1 Soft, $16.75 to $17; No. 2 Soft, $16.25 to $16.50; No. 3 Foundry, $15.50 to $15.75; No. 4 Foundry, $15 to $15.50.

CHICAGO.—The demand for ordinary Foundry Irons has been sharp for spot delivery and for early shipment, but business for future delivery has not been large, although good inquiries are in the market. The supply of local Iron is extremely scanty, and the large Southern companies are not willing to take more contracts at present. Prices for spot Iron run from $1 to $2 per ton above quotations made on contracts for the last half of the year. We quote as follows:

Lake Superior Charcoal	$20.50 to $21.50
Local Coke Foundry, No. 1	18.50 to 19.00
Local Coke Foundry, No. 2	18.00 to 18.50
Local Coke Foundry, No. 3	17.50 to 18.00
Local Scotch, No. 1	19.00 to 19.50
Ohio Strong Softeners, No. 1	19.60 to 20.00
Southern Silvery, according to Silicon	16.90 to 17.15
Southern Coke, No. 1	16.40 to 16.65
Southern Coke, No. 2	15.65 to 15.90
Southern Coke, No. 3	15.15 to 15.40
Southern Coke, No. 1 Soft	16.40 to 16.65
Southern Coke, No. 2 Soft	15.65 to 15.90

PHILADELPHIA.—It is impossible at the present time to quote Pig Iron with any degree of accuracy. Quotations given by leading houses show as much as $4 per ton difference in prices for the same grades of Iron. For example, if there is no spot Iron to be had at less than, say, $19 to $20 for No. 2 X Foundry, consumers have no alternative but to pay the price or go without the Iron. Orders for the same grade of Iron can also be placed at $16.50 to $17, but no deliveries are promised inside of six months, and not guaranteed even then; so it is a question whether it is better to pay $20 for something that can be had at once, and so tide over an emergency, or to contract at $3 or $4 less for deliveries at a time when conditions may be entirely different to what they are at the present time. These are the present problems which the trade are trying to solve. So far as immediate relief to the market is concerned prospects are not better than they were a week ago. Higher prices are mentioned for March and April shipment, but the extreme range will be about as follows for city and nearby deliveries:

	Deliveries to July.	Delivery July to December.
No. 1 X, Foundry	$19.25 to $20.00	$18.50 to $19.00
No. 2 X, Foundry	18.75 to 19.50	17.00 to 17.50
No. 2, Plain	18.25 to 18.50	16.50 to 17.00

PITTSBURGH.—The present condition of the Pig Iron market is without parallel in the history of the Iron trade. It is really not a question of price in the Pig Iron market any longer, but where to get the metal. Iron for delivery this side of October has been pretty well cleaned up, and for any stray lots that can be had sellers can get almost any price they ask. No. 2 Foundry Iron has sold up to $20 a ton, Pittsburgh, for prompt delivery. The market is in such shape that it is practically impossible to quote prices.

CINCINNATI.—The Pig Iron market is still quiet, but by no means dull. One of the main reasons why Iron is not selling more freely is because furnaces are either already sold out or prefer to withhold their output for late delivery until they see where they land in regard to prices and stock to offer later in the year. The price of the leading Southern interests is nominally unchanged, yet in the face of this it is a known fact that No. 2 Foundry is selling from outside furnaces as high as $13, Birmingham basis, and for delivery prior to August premium of even 50c. over that figure is offered. There is a strong undertone to the quotation list, and it is very hard to see how the minimum price of $12.50, Birmingham, for No. 2 can be much longer maintained even nominally, as a good portion of the actual selling is being done considerably above that figure. There is a determined effort being made to raise selling prices, and in this sellers claim the support of the buyers to a very large degree. We quote f. o. b. Cincinnati:

Southern Coke, No. 1	$15.25 to $16.25
Southern Coke, No. 2	14.75 to 15.75
Southern Coke, No. 3	14.25 to 15.25
Southern Coke, No. 4	13.75 to 14.75
Southern Coke, No. 1 Soft	15.25 to 16.25
Southern Coke, No. 2 Soft	14.75 to 15.75
Southern Coke, Gray Forge	13.75 to 14.75
Southern Coke, Mottled	13.75 to 14.75
Ohio Silvery, No. 1	18.25 to 18.50
Ohio Silvery, No. 2	17.75 to 18.00
Lake Superior Coke, No. 1	18.35 to 18.60
Lake Superior Coke, No. 2	17.85 to 18.10
Lake Superior Coke, No. 3	17.35 to 17.85

ST. LOUIS.—The volume of inquiry and sales has slackened considerably, but the tone of the market is very firm and the amount of material available for immediate shipment is extremely light. Owing to this fact a wider range of prices prevails, and advances of 50 cents, and sometimes more, for small lots, above our quoted prices are not uncommon. Owing to the improvement in weather conditions shipments are moving in a more satisfactory way and work of production is also showing improvemement. We quote for cash, f. o. b. St. Louis, as follows:

Southern, No. 1 Foundry	$16.00 to $16.50
Southern, No. 2 Foundry	15.25 to 15.75
Southern, No. 3 Foundry	14.75 to 15.25
Southern, No. 4 Foundry	14.25 to 14.75
No. 1 Soft	15.75 to 16.25
No. 2 Soft	15.25 to 15.75

CHICAGO REPORT.

Scrap Iron and Steel.—The demand is very good, and prices are strong. We quote dealers' buying prices for carloads lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	13.00 to 13.50
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 8.50
Sheet Iron and Hoops	8.00 to 8.50
Plow Steel	11.50 to 12.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	7.00 to 7.50
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—Consumers are buying liberally. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	10½c.
Copper Clips	11 c.
Red Brass	12 c.
Yellow Brass	8 c.
Red Brass Borings	9 c.
Yellow Brass Borings	7¼c.
Light Brass	7 c.
Pipe Lead	3.87½c.
Tea Lead	3.35c.
Zinc	3.10c.
Tin Foil	19 c.
Pewter, No. 1	16 c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—Business is quiet. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6¾c.
Rubber Car Springs	....	5 c.

Rags.—The stocks are so large that another decline is expected. Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 70 to 75c. per 100 lbs. in any quantity.

Anthracite Coal.—The demand is light. Dealers are waiting for an announcement of a reduction in prices. Prices are as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis.	6.20	6.45
Kansas City, Mo.	8.25	8.50

THE HARDWARE TRADE.

The trade is gradually recovering from the effects of the interruption of business caused by the recent severe weather, and especially the freshets, which interfered somewhat with the operation of mills and factories, already overtaxed, to meet the demands of the trade. There has, however, been a very satisfactory return to the volume of business, which is at least normal, and the production of goods which is going on in nearly all lines makes the record. The orders coming in to the manufacturers in all lines indicate a healthy condition of business throughout the country. The bulk of the orders from the large houses have already been placed, but some supplementary ones are being received, together with many from the smaller jobbers and larger retailers. The volume of new business is thus considerable, and with the orders in hand the manufacturers have enough in sight to keep them occupied for several months. In many lines the difficulty is to get goods. The scarcity of raw material is a troublesome matter, interfering with the output of the factories. The tone of the market is decidedly firm. A number of minor advances are reported, and in products which lie near the raw material the market is especially strong with an upward tendency. The reports in regard to building throughout the country are very encouraging and the indications point to an active demand for Hardware in these lines. The financial condition through the trade is eminently satisfactory and there is comparatively little complaint in regard to collections. The enterprise of the country continues to show itself in many ways and the prospect for a large business is excellent.

NOTES ON PRICES.

Wrought Iron Pipe.—The National Tube Company have adopted new base discounts on Wrought Iron Pipe and on Wrought Steel Pipe. The new discounts are placed on the goods f.o.b. cars Pittsburgh, Pa., and are as follows:

⅛ to ½ inch Black Pipe, 60 per cent.
⅛ to ½ inch Galvanized Pipe, 48 per cent.
¾ to 12 inch Black Pipe, 67 per cent.
¾ to 12 inch Galvanized Pipe, 55 per cent.

The difference between the jobbing point and shipping base discount has remained unchanged. The base discounts in the Metropolitan district are 1 3-10 on the gross higher than Pittsburgh prices. The National Tube Company are giving their preferred customers an additional discount of two fives on the base, and all other customers are receiving an extra 5 per cent. on the base. The preferred customers purchase their Pipe in flat cars; that is to say, that one car contains but one size of Pipe alone, and cars containing mixed sizes are, as a rule, diverted to the preferred customers. In this manner the mills can ship the goods at a lesser expense, and preferred customers get the benefit of the mixed car trade. The new prices show that Wrought Iron Pipe has advanced within the past month about 12½ per cent. This last advance, it is said, will not last very long, but is likely to be superseded as soon as the spring trade opens by still higher quotations.

Fresh Air Inlets.—Owing to the fact that the Master Plumbers' Association of Brooklyn, N. Y., succeeded in having the enactment concerning ventilation and backairing in the Borough of Brooklyn changed, so as to permit ventilating devices of more than one maker to be used, the Hart-Ayres Plumbing Company have announced the following change in price of the Ayres Fresh Air Inlet: 4-inch is now $6.50 net, and 6-inch is now $11.50 net. We understand that this concern are also putting another Inlet on the market in competition with the Ayres Fresh Air Inlet, thus complying with the law and at the same time controlling the business of Fresh Air Inlets in the Borough of Brooklyn.

Galvanized Boilers.—The manufacturers of Galvanized Range Boilers will hold a meeting on March 25 and new prices will probably be announced. It is understood that an arrangement has been reached with the Brooklyn Range Boiler Company and that negotiations are pending with the Pennsylvania Range Boiler Company, which will result in an amicable settlement of the differences which have kept the market cut up for some time past. It is stated from an authoritative source that a patented Range Boiler which was put upon the market about a year ago has proved to be a failure, and that the company manufacturing it are now entirely out of the race; consequently no further trouble is anticipated from this quarter.

Sanitary Earthen Ware.—The prices made by the Sanitary Potters' Association, which went into effect March 1, are being adhered to. They will be operative until March 1, 1903, until which time no change from the present quotations on Sanitary Earthen Ware is likely to take place.

Nuts.—A further advance was made by the manufacturers on the 18th inst. in the prices of Cold Punched and Hot Pressed Nuts. This advance has been made on account of the advance in the price of Iron. The manufacturers are also filled up with orders.

Egg Beaters.—The manufacturers of Dover Egg Beaters, who are working together with a good degree of harmony, have made another advance in prices.

Pumps.—There is a good deal of unevenness in the market for Pumps, and low prices are current on Pitcher Spouts. There is, however, an excellent demand, and several of the manufacturers are considerably behind their orders.

Stove Boards.—The prices which are ruling for Stove Boards are somewhat higher than were current a year ago. The volume of business which is being booked by the manufacturers is large, and the indications are that the supply will be fully taken up by the trade.

Set and Cap Screws, &c.—This line of goods is characterized by a firm tone, and the recently advanced prices are well maintained. The large business which the manufacturers are doing indicates the activity which prevails throughout the trade.

Wire Nails.—It will take some time for the mills that were flooded to catch up with their orders for Wire Nails. The majority of the mills are behind on their orders, and shipments are further delayed by scarcity of cars. The demand for Nails in the New York market is not quite as large as was anticipated by jobbers. Stocks are broken in assortment to some extent, owing to delayed shipments from the mills. The market is firm at $2.25 to $2.30 per keg for small lots from store.

Cut Nails.—Difficulty is experienced in obtaining Cut Nails, especially Steel Nails, on account of the high price and scarcity of Steel. Some of the Cut Nails on the market are made of Scrap Iron. New York orders for Cut Nails are about of the usual proportions to Wire Nails. Small lots from store are selling at $2.25 per keg.

Window Glass.—At a meeting of the Eastern section of the National Jobbers' Association, held on March 18, the price of small lots of Window Glass, single and double strength, from store was advanced from 90 and 10 to 90 and 5 per cent. discount. The demand for Window Glass is light at the present time.

White Lead.—An improvement was noted in the demand for White Lead in Oil during the week for immediate and April delivery. Quotations are without change at 6½ cents per pound for lots of less than 500 pounds, and 6¾ cents for small quantities.

Linseed Oil.—Owing to a slight show of weakness in Linseed Oil prices considerable Oil was sold early in the week at a shade under quoted prices. It is understood that most of this Oil was purchased for immediate consumption. The tone of the market is again firm, City Raw in small lots being quoted at about 64 to 64½ cents per gallon, and out of town Raw at 63 cents.

Spirits Turpentine.—On account of light receipts of Turpentine at Southern points and severe weather in the Turpentine district prices have advanced at this point about 3 cents per gallon. Under these conditions the demand is light. Small lots of Turpentine are now quoted at 49 to 49½ cents per gallon.

TRADE NOTES.

The American Brass Novelty Company of Grand Haven, Mich., are about to put up a factory building to cost $10,000.

The National Enameling & Stamping Company are erecting a new foundry in connection with their plant in St. Louis, Mo.

The Sharon Brass Company have been organized at Sharon, Pa., with a capital stock of $50,000, with M. O. Shrock as president and J. L. Merritt of Greenville, S. C., as secretary. R. A. Wilson and T. L. Woodward, Pittsburgh, with the above named officers, form the Board of Directors. The company will erect a plant on Ellsworth avenue, Sharon.

The American Standard Company of Washington, D. C., have been incorporated in Delaware, with a capital of $100,000, to manufacture Paints and Oils.

Kramer Brothers, Dayton Stove Repair Works, Dayton, Ohio, have just brought out a line of Cement Tampers, Jointers, Edgers, and other tools especially devised for cement and concrete work. These tools are of the latest improved patterns and are made of the highest grade material in a substantial manner. A large line of Cast Iron Lawn Flower Vases, ranging in size from the smallest to the largest made, new in design and all from new patterns, has also been added to their productions.

The Birmingham Brass Company of Shelton, Conn., one of the oldest concerns in the Brass business, are about to dissolve. The company were organized in 1866 at Ansonia, Conn., under the name of the Osborne & Cheeseman Company, with a capital stock of $120,000. About 20 years later they moved to Shelton and reorganized under the name of the Birmingham Brass Company. The company's plant includes a rolling mill and a manufacturing department in which a large line of small Brass Ware is made.

Protection from Lightning.

In discussing the question of protection from lightning, Killingworth Hedges compares European and American practice, and refers to his rearrangement of the system used at St. Paul's Cathedral, where the conductors, erected as recently as 1872, were found to be totally inefficient, both as regards the conductivity of the joints and the resistance of the earth connections. In the plan recommended, both for this installation and for the more recent one at Westminster Abbey, the number of ordinary conductors from air to earth had been greatly increased, and, besides these, horizontal cables had been run on the ridges of the roofs and in other prominent positions, so as to encircle the building, being interconnected to the vertical conductors wherever they crossed one another.

The horizontal cables were furnished at intervals with aigrettes, or spikes, invisible from the ground level, which were designed to give many points of discharge. At the same time they, in conjunction with the cables, would receive any side flash which might occur should any portion of the building receive direct stroke of lightning. The unreliability of soldered joints for conductors, whether of cable or tape, had led Mr. Hedges to design a special joint box. A special form of tubular earth has also been designed, which takes up little space, and has the advantage that if a suitable moist ground is not obtainable the desired low electrical resistance can be attained by leading a tube in connection with the rain water pipes, so that a portion of the rainfall is diverted to the tubular earth.

The author alluded to the immense amount of damage to property annually occurring which might be prevented if efficient conductors were installed. He mentioned that instead of every church having its lightning conductor, not 10 per cent. were so provided; and in the case of other public buildings the percentage was not much larger, the reason in the case of the former class of buildings being that a vicar wishing to safeguard his church had usually to pay the cost out of his own pocket.

Architects as a rule treated the question of lightning conductors in a very brief manner, and in their specifications seldom said anything as to the way in which they were to be run, or the necessity for good joints and good earth connections.

RURAL FREE DELIVERY

THE SIGNAL MAIL BOX
BATES-HAWLEY PATENT.

A POSTOFFICE AT YOUR DOOR

THE SIGNAL MAIL BOX, Bates-Hawley Patent, IS THE ORIGINAL BOX FOR RURAL SERVICE. It has been especially recommended by the Postmaster General

It is the largest, and the only box full government size, 18 in. x 6½ in. x 11½ in., and the only one which meets all the requirements. 7½ million dollars just appropriated for extension of rural service this year. From 100 to 1,000 boxes will probably be put in in your vicinity. You should sell them. Write us for prices.

SIGNAL MAIL BOX CO., 101 Benton St., Joliet, Ill.

(burned in the enamel) ARE SAFE

We claim Purity and Safety, and Substantiate this claim with Chemists' Certificates.

(Reduced fac-simile of label).

NAME OF UTENSIL.

AGATE
NO. L & G MFG. Co.
NICKEL-STEEL-WARE

Patented Feb. 12, 1895.

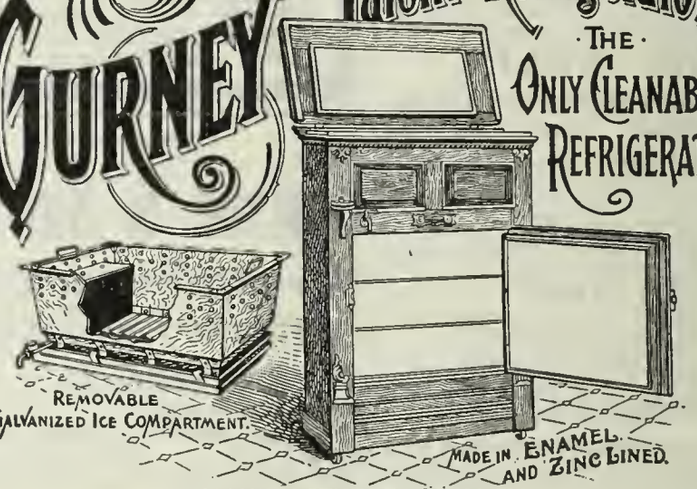
COST	SELL

Analysis No. 72,339. NEW YORK, Dec. 7, 1896.
We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.
The enamel coating is homogeneous, of extra thickness, and great purity.
It is *entirely free from arsenic, lead* and *antimony*—metals so often found in enameled goods.
Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

{ Pierre de P. Ricketts, E.M., Ph.D.
{ John H. Banks, E.M., Ph.D.
Analysis No. 14,180. NEW YORK, May 5, 1897.
LALANCE & GROSJEAN MFG. CO.:
GENTLEMEN—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.
We find this enamel is *absolutely pure and free from Arsenic, Antimony, Lead and other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,
RICKETTS & BANKS,
Chemists to the N. Y. Metal Exchange.

Guaranteed Double Coated and Absolutely Pure
Copyrighted.

Look for this Label (Sustained by U.S. Circuit Court.) Printed on BLUE PAPER and pasted on every Kitchen Utensil made in Genuine AGATE NICKEL-STEEL WARE as a guarantee of Absolute PURITY and SAFETY



☞ Read carefully the Chemists' Certificates.

CONDUCTOR PIPE

WON'T BURST :=: The twist in the corrugation checks the sudden fall of ice and water, thus protecting the joints. It stands hard knocks because of its spiral corrugation. Again, it is much handsomer than plain pipe. Made in copper and galvanized iron. Write for catalogue and information, free. Address

AMERICAN STEEL ROOFING CO.,
MIDDLETOWN, O.

WHY NOT USE

Aluminum Coated Sheet Steel?

Superior, in all respects, to Galvanized. It contains all of its merits with none of its defects. It can be heated to a red heat without destroying its coating. Sulphurous gases, brine, salt and acids do not affect it as readily as galvanized. It can be so'dered with common solder. Will stand more severe tests than any coated metal.

MASTERS OF THE CEILING SITUATION

We are **THE RIGHT PEOPLE** to question about **METAL CEILINGS**; we know the Metal Ceiling business from A to Z.

Our ceiling plates are the deepest stamped; they are also the most artistic.

We lead in variety of patterns. In the past year, we have brought out more new artistic designs than have all other Metal Ceiling manufacturers put together.

Did we say **MORE** new designs? Yes, fully two or three times as many. We are to-day the only ones prepared to furnish complete

"BERGER'S Classik" METAL CEILINGS

in harmony with leading styles of architecture.

As a matter of course, our Metal Ceiling trade exceeds that of our competitors.

If you want information about Metal Ceilings—ask **US**—**WE** can tell you.

If you want estimates on prospective work, send sketch and measurements of spaces to be covered, and we'll submit designs and prices.

We want a chance to demonstrate that we can handle your work to your satisfaction.

Why not give us a chance?

23rd and Hamilton Sts., Philadelphia, Pa. 14 Harcourt St., Boston, Mass.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

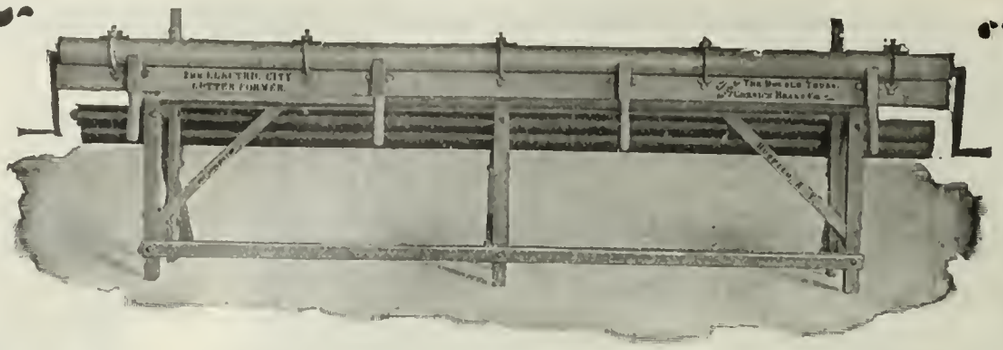
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING,
  2. FLARING WORK,
  3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

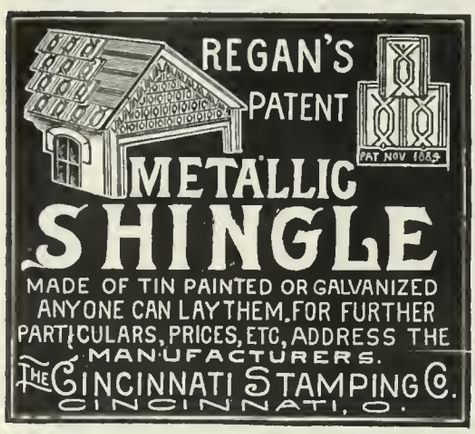
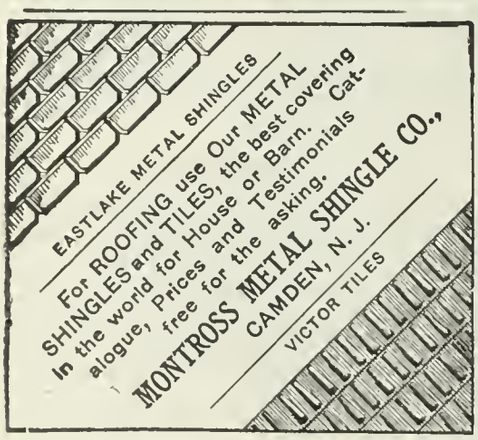
New in Principle.

Unexcelled. 50 % Saved.

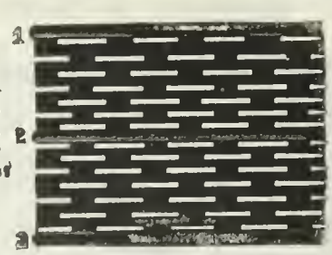
THE ELECTRIC CITY GUTTER FORMER.



The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.



The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.



Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS. With Lever Arc, Automatic Gauge. Will cut No. 22 iron
97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

ROUND OAK
STANDARD of AMERICA

The Round Oak Steel Range

is the kind of a range
you want to sell
to your good
permanent lasting customers.

It is also the
kind of a range
you want
to sell to the man
to whom you have
never sold before.

You want a
good range to sell
to keep the trade
that you have
and bring new trade
to your store.

If everything in your store
was as good
in its way as
the Round Oak steel range
is in its,
you would have
a mortgage
on all
the good trade
in your town.

Suppose you consider this!
Perhaps you can
take it up
and make a successful
"run" with it.

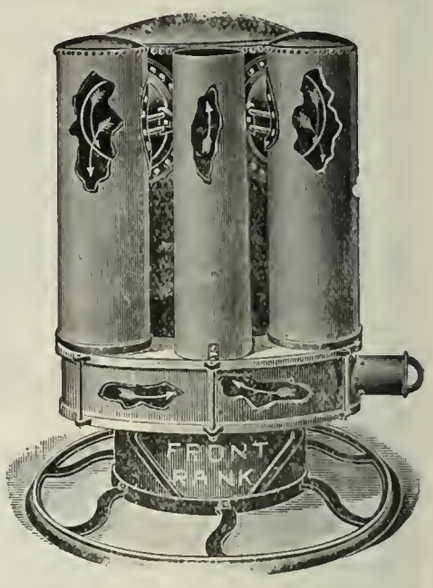
WILL BE FURNISHED FOR THE ASKING BY

Enterprise Stove Co., VINCENNES, IND.

Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.



The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

THE PATRIC FURNACE.

HAS

TALKING POINTS

OF MERIT

FOR THE DEALER.

SIMPLICITY.

In construction the Patric Furnace is exceedingly simple. This point always appeals to the prospective purchaser. No clogged radiator. It needs no clean-outs. Look at the illustration and see for yourself.

DURABILITY.

This is one of our hobbies. The Patric Furnace is noted for its durability. One man writes that his furnace has been in use every winter since 1873, twenty-nine years, and still heats as well as when it was first put in. Good materials account for that. We use them now and always have.

SMOKE-BURNING and COKING MAGAZINE.

Here's where we have a winner. It is a scientific feature that sells lots of Patric Furnaces. Use l only on the Patric. A success for the past 17 years. Highly recommended by our customers Cokes the coal and burns the volatile parts of the smoke and gases. A great talking point.

OUR HOT-BLAST.

Our hot-blast device for aiding combustion delivers heated air directly into the combustion chamber. No part in the fire to clog or burn off. Your customers must have a hot-blast.

Send for catalogue, price-list and discounts to dealers.

	No. 8—20	No. 9—20
The Oven measures	20 x 20 x 12½ inches.	
Fire Box, INSIDE Coal linings	17⅛ x 7¼ x 7⅜ "	
Ash Pit	17⅜ x 18 x 4½ "	
Fire Box for Wood	26 x 7¼ x 7¼ "	

If you got only the same value in the "HOME WINTHROP" as in other first-class ranges and paid us $5.00 less for it, you wouldn't make a very bad investment.

The "HOME WINTHROP" is a better range in every detail of construction than any other range now on the market.

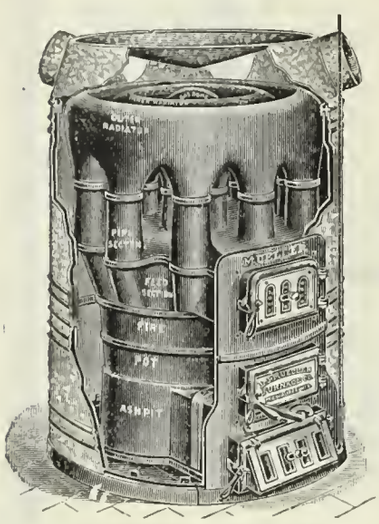
No other range heats all five sides of the oven as evenly or will bake with as little fuel.

No other range has a dust flue which takes all the dust up the chimney, even if the draft slide is open when you shake the grate.

The selling value of the range you now handle depends principally upon how much advertising has been put into the name on the door.

When you show a "HOME WINTHROP," you know, without any question, that you can show points of superiority over any other range and easily demonstrate how and WHY it is better.

The "HOME WINTHROP" can be sold for the same money as any other first-class range and yield you $5.00 greater profit.



Your customer would get better value for his money even if he paid you $5.00 more for it.

If your price to your customer is in proportion to the price you pay us for it, so much the better for your customer.

Ask the next Stove salesman that comes along how his range differs from twenty others.

You can't afford to be in the stove business and not know about the "HOME WINTHROP."

. . . . FIFTY-TWO YEARS

LONG while, isn't it? A man ought to learn something in that time, hadn't he? Well, we don't know it all, but we do know how to make Furnaces. Our apparatus, owing to its tubular construction, carries away the heat as fast as made, not allowing the air to become burnt or overheated. From a sanitary point of view it has no rival. We embody in our goods only the best materials and workmanship. Say! Mr. Dealer, there's a good profit in it, too.

WRITE FOR CATALOGUE.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

KITCHEN BOILER CONNECTIONS.

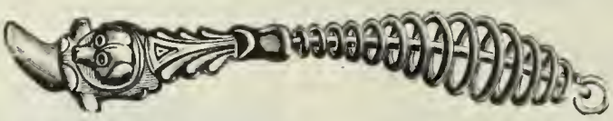
A SELECTION OF
Practical Letters and Articles Relating to Water Backs and Range Boilers.
FIFTH ENLARGED EDITION.

194 Pages, 113 Illustrations, 6 x 9 in Cloth Bound.
Price, $1.00, Postpaid.

Press Notices of First Edition:

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*



The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The Roofing, Cornice And Skylight Manual

175 Pages, 170 Illustrations, 13 Plates

THE ROOFING, CORNICE AND SKYLIGHT MANUAL is an important addition to our increasing line of practical books for Sheet Metal Workers. It is a substantial volume, well printed and bound, and freely illustrated with engravings, accurately showing the various phases of work in progress.

The three subjects of Tin Roofing, Cornice Shop Practice, and Skylight Construction are discussed in a thorough and practical manner, the work being designed as a shop companion or reference for sheet metal workers, as well as a guide to young mechanics who are intending to follow any or all of these branches of work.

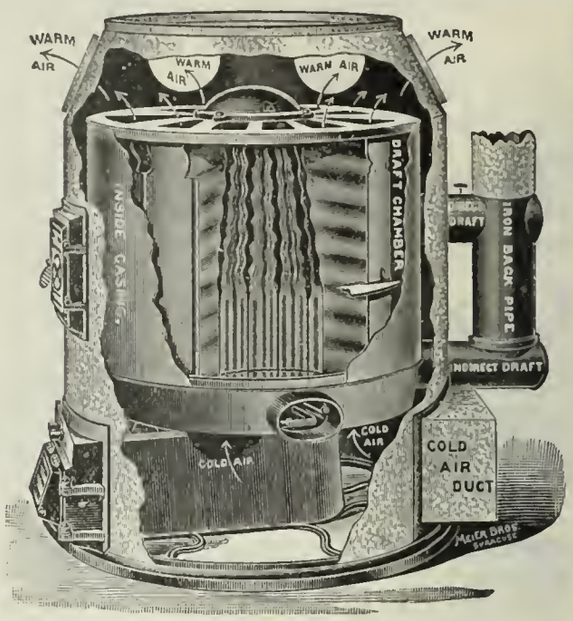
Tin Roofing Pages 1–50. This section presents an article prepared specially for the book by an expert mechanic. A few of the subjects treated are the laying of flat and standing seam roofing, described in detail, with instructions for flashing around chimneys; connecting roofs with wall flashing; covering parapet walls and bulkheads; putting in valleys; shingle flashing, &c. An important table is given for finding the quantity of tin required for roofs.

Cornice Making Pages 51–140. This part of the volume consists of an article entitled "The Country Cornice Shop," reprinted from *The Metal Worker*, and treating the subject at length. It embraces a description of a shop equipment, such as can be purchased or made, and adapted to the country shop. A few of the subjects treated are the method of developing the patterns for much of the simpler work, as well as for cutting cornice miters; attaching molded gutters to brick walls; the attachment of eave trough to roofs of different kinds; the manufacture of round and square leaders; the making of simpler ornaments, etc.

Skylight Construction Pages 143–175. This division of the work consists of two prize essays reprinted from *The Metal Worker*, giving instructions for the production of skylights of all sizes, the development of hip bar and miters, also curb and side bars. One of these articles describes a skylight without a ventilator, and the other a skylight with a ventilator in the top. The illustrations cover various phases of the work fully and also show the method of catching the condensation which occurs with all skylights.

PRICE $1.50, POSTPAID

DAVID WILLIAMS CO., Publishers, 232-238 William St., N. Y.



The Kelsey Warm Air Generator.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

The Labor Outlook.

The whole condition of trade is so satisfactory and the outlook for the future is so extremely encouraging that a long period of prosperity seems assured. But an effective way in which this prosperity can be checked is by a series of labor troubles which will interfere with the operation of factories consuming raw material and converting it into finished products. At present the utmost energy of the forces of production of the entire country is necessary to keep the channels of consumption supplied. It is likely that after the severe experiences of last year the employees in iron and steel works will not soon be disposed to try conclusions with their employers, but will endeavor to pursue their way peacefully and industriously. This view of the situation is justified by the agreements which have already been made for keeping mills in operation during the summer without stopping for the adjustment of the wages schedule for another year. If the same placidity was observed in other parts of the labor field the outlook would indeed be most assuring. Unfortunately there are indications that presage disturbance in the foundry industry. The Iron Molders' Union of North America expect to hold another of their national conventions this year, and it may reasonably be expected that a strong effort will be made to show those who gather in that convention that something is being done by the leaders for the welfare of the rank and file, and this can best be done through a strike of large proportions. The agitation of another strike in the machinists' trade has begun in Chicago, being directly fomented by the president of the International Association of Machinists, who has announced that the movement for a nine-hour day would be renewed on May 1. Looking around still further, it is observed that the coal miners in some of the important Western coal fields, the engineers on lake vessels and other workingmen in many lines are preparing for trouble. The recent events in Boston show how easily an apparently insignificant matter may develop into a most serious condition of affairs. It will take all the time and energy of the Civic Federation and other conciliatory agencies to tranquilize these uneasy forces or to secure a speedy settlement of differences when labor troubles break out. Otherwise, the number of persons finding 1902 a period of prosperity and individual advancement may be heavily reduced.

Preparing for the Conventions.

It has been noted in connection with the recent meetings of the various State associations of master plumbers that the Cleveland Resolutions adopted by the Executive Committee of the National Association of Master Plumbers have been quite generally indorsed. This action would appear to afford evidence that many master plumbers are willing to operate under a set of resolutions from which the arbitration feature has been eliminated and which have not been accepted by the supply trade. On the other hand, well informed men in the trade are of the opinion that the supply trade was never so thoroughly a unit as at the present time in their indorsement of the Chicago Resolutions adopted by the National Committee of the Confederated Supply Associations, which are said to concede less to the master plumbers than was conceded by the New York Resolutions. From this statement of conditions it would seem that unreconcilable conditions existed, but fortunately there are men in both associations who are opposed to any break that would interfere with the general business and welfare of the trade. Some master plumbers have been met by the supply trade in their community, and are trading under an agreement that would be by no means satisfactory to those who prefer the New Orleans Resolution. On the other hand, there are those in the supply trade who would not support any step that would inevitably lead to a trade war, although others are willing should any radical step be taken to advocate an open market on plumbing goods. It remains for the diplomats in both associations to so direct the discussions at their meetings that all points may be fairly thrashed out, with the view of bringing about the conclusion that a mutually agreeable and reasonable arrangement must be effected. There is always enough friction in the transaction of business without inviting the serious trouble that would follow a break in trade relations, and it is earnestly to be hoped that the outcome of the deliberations at Atlantic City will be harmony.

Another Victory for Arbitration.

Evidence is accumulating that the movement for the arbitration of labor disputes initiated by the National Civic Federation a few months ago is meeting with cordial support from both employers and workingmen. Already some gratifying results have been accomplished. The recent settlement of the protracted strike at the plant of the National Cash Register Company, at Dayton, Ohio, is an important achievement that must be placed to the credit of the federation's special Conciliation Committee. The trouble that has now been amicably settled began some nine months ago, when about one hundred union metal polishers employed at the cash register works went out on strike as a protest against the discharge by the management of certain of their fellow employees. In consequence the entire plant was shut down and over 2000 workmen were for a time thrown into idleness. Organized labor regarded the struggle as so important that a boycott was inaugurated, and has been assiduously carried on against the products of the Dayton factory. The dispute remained unsettled

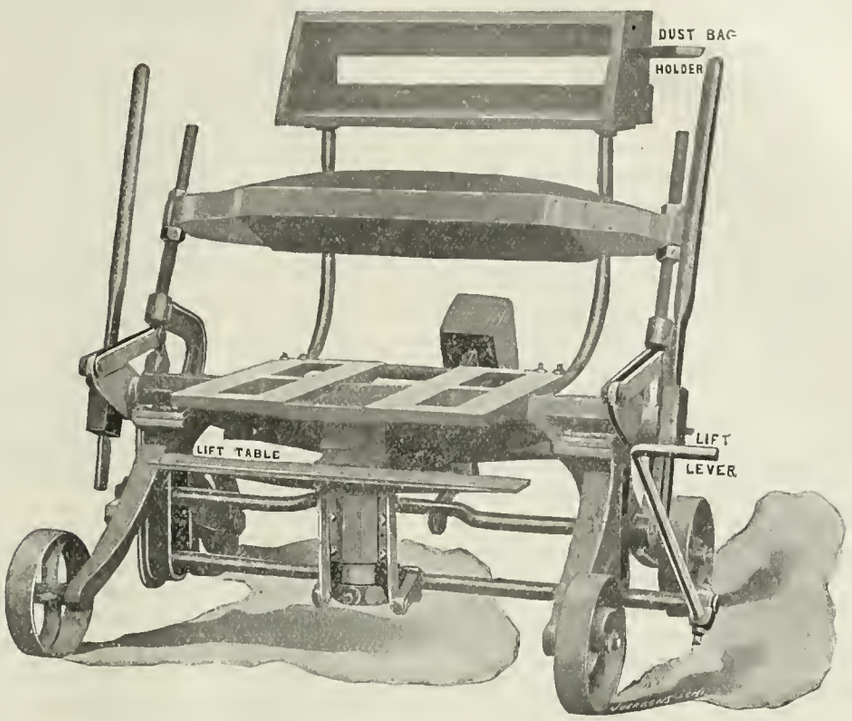
until the Conciliation Committee of the Civic Federation took up the matter, and after two days' conference in New York succeeded in bringing about a satisfactory adjustment. The success that the arbitration movement has already met with in this and one or two other instances promises well for the proposed system of permanent mediation in labor disputes. It is gratifying to note that the efforts now being made to this end are receiving cordial support from the prominent labor leaders of the country and from the more sane and substantial labor organs. It is recognized alike by employers and employed that strikes are expensive and disastrous to both parties, and the feeling is growing that it would be to their mutual advantage to adopt Senator Hanna's advice and join hands in the support of a method whereby these wasteful struggles may be avoided. While it will be useless to look for an early industrial millennium, there are decided indications that a long step is being made toward a better understanding between capital and labor, and this is sufficient ground for congratulation.

The Social Side of Trade.

While the past history of the trades in which our readers are interested records an occasional dinner or meeting arranged mainly for social purposes, it has remained for the social side of their business to reach a fuller development in the past year or two. If cultivation of the social side found justification in the benefits derived from the dinners given in the past by the old Caloric Club of New York City, which was purely a social body, its natural successor, the Carbon Club, has in this way accomplished still more for the general benefit of the trade, and the annual dinner of that society is a feature that is now looked forward to with interest and pleasure. In the West the impromptu golf tournament arranged by the Chicago steam and plumbing supply trade last fall has led to the permanent establishment of the Trade Golf Association in that city, composed entirely of members of the plumbing and steam supply trade. The newest body organized entirely for social enjoyment and relaxation from business is the Plumbing and Steam Supply League, which has just finished a bowling tournament in New York City. A particularly pleasant feature of the league, which is composed of teams representing some fifteen different supply houses in New York and vicinity, was the dinner last Saturday night, at which the prizes were presented to the winners. The frequent meetings of the league this winter have built up friendly connections that probably will last throughout the business career of many of the men. Its influence was sufficiently marked to elicit from those interested a strong expression of hope that the league would be continued and another tournament carried on next fall. Prominent members of New York houses have found pleasure in visiting the bowling alleys when the contests were going on, and not only have many annoying incidents been explained so that confidence was established, but strong friendships have been established which cannot operate otherwise than to the general good of the trade. There is nothing so well calculated to destroy the capacity for harm of the many petty annoyances that arise in the transaction of business as the warm regard fostered by the cultivation of the social side of trade.

Oil vs. Coal for Fuel Purposes.

It would seem a very simple question to ascertain the relative values of oil and coal for commercial fuel purposes, but there is a very great diversity of opinion upon the subject, and the testimony for and against is so contradictory that a verdict cannot be rendered for either. Despite all the elaborately careful experiments made by various governments to fix the value of oil it is not used to any extent by the naval powers, coal still having the preference, notwithstanding all the drawbacks of dirt, space and force required to handle it. It is not the difficulty of getting good fires, or dangers of spontaneous combustion that delay the general use of oil, it is simply that in daily use—oil against coal—those who pay the bills continue to use coal, and to do this there must be a balance in its favor. One foreign steamship company—the Shell Line of England—have declared unhesitatingly for oil after two years' experience in the use of it. One vessel of this line, the "Clam," has run 85,000 miles with oil fuel, and can stow 4,500 tons of it. It is carried in well-holds reaching from the double bottom to the under deck, and the success of the "Clam" has been so marked that there are four other ships building which will each carry 11,500 tons of oil fuel, or for commercial purposes. These vessels, when not needed for oil freight, can have their holds thoroughly disinfected by the admission of live steam, after which they are wiped down and whitewashed, removing every trace of the smell attending petroleum. The Shell Line has been carrying Borneo oil previously, but a portion of the fleet has loaded Texas oil, and a large cargo of it recently arrived in England. It can be delivered there in bulk for a little under $9 a ton of 2,250 pounds, which, as compared with coal, cannot be called cheap. The parties interested in the enterprise point out that oil is relatively much cheaper because it has a higher calorific value and will, therefore, do more work, but as this is the moot point in the controversy of oil vs. coal it does not seem to be a commercial consideration. A great point established, however, is that Texas oil has now an outlet to foreign markets.



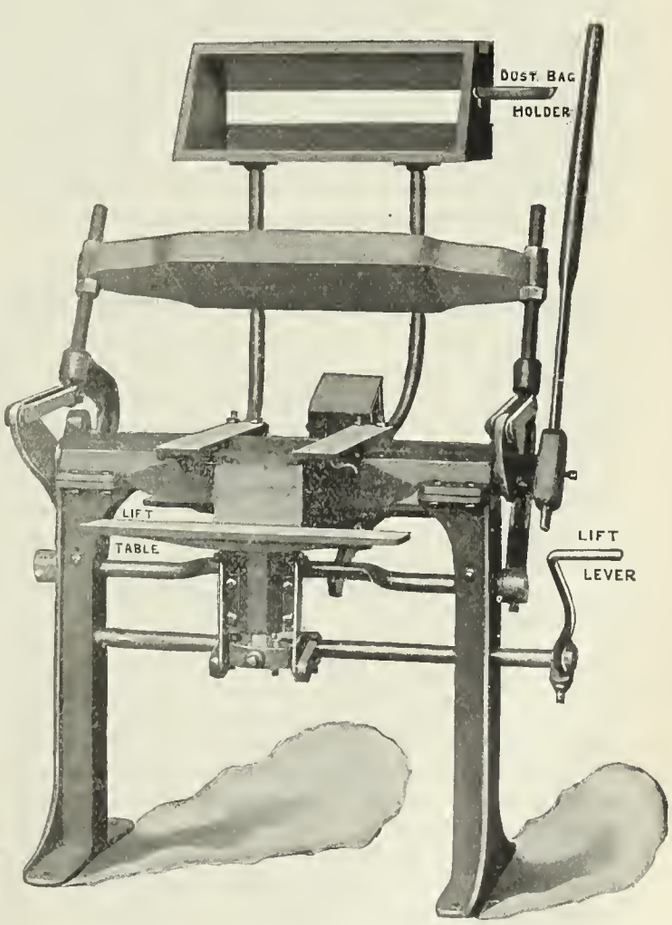
THE AMALGAMATED ASSOCIATION WAGE SCALES.

It is not thought that the Amalgamated Association, at their convention in Wheeling, W. Va., next month, are likely to upset the wage scale agreements entered into between the officials of the association and the American Tin Plate Company, the American Sheet Steel Company and the Republic Iron & Steel Company, whereby provision is made for the uninterrupted operation until July 1, 1903, of the tin plate, sheet and bar iron mills of the companies named. At the same time the possibility exists of a repudiation of the action of their representatives by the Amalgamated Association as a body, and until the matter has been acted upon favorably by the convention the danger of possible labor disturbances in these mills cannot be regarded as positively removed. There is undoubtedly a strong prejudice in some quarters against President Shaffer, and it is just possible that the disaffected element in the association may see fit to work up a sufficiently strong sentiment against that official to enable them to overthrow the agreements made by Shaffer and his associates, with the view of discrediting their work. Those who are well qualified to judge of the matter, however, seem to be of the opinion that the men will recognize the advantages that will accrue to them by the indorsement of the wage agreements and will not allow the gratification of a personal grudge to stand in the way of securing uninterrupted work at the present generous scale of remuneration. It is to be hoped that the convention will see the matter in the right light and ratify the agreements made with the tin plate, sheet and bar makers, especially as those agreements will be binding not only on the companies named, but also on the independent manufacturers having dealings with the Amalgamated Association.

LACK OF PROFITS IN THE GAS STOVE TRADE.

BY G. B.

In reading *The Metal Worker* of February 22 the article on "Lack of Profits in the Gas Stove Trade" attracted my attention because it reflects an experience which exactly fits this district; but I did not know the case was so bad all over the United States. I think the manufacturers of gas stoves should agree not to sell their stoves to any gas company, because it is done at a loss to the regular dealer, and to my mind no one is benefited. Any purchaser of a gas stove would be willing to pay $3 or $4 profit on a stove if it was a good one. When a gas company buy one make of stoves for a city about 20 other makers are shut out of that town, for the reason that all the stoves sold by the gas company are sold at cost, or less than cost, and as the dealers have no opportunity to make a legitimate profit they cannot purchase the gas stoves of other makers. I should very much like to see the gas stove manufacturers combine against this custom of the gas companies. The price of a stove has nothing to do with the selling of gas. If the gas company will sell good gas low enough the people will buy the stoves. As "W. R." says in his article, if it was not for the coal stove business many manufacturers would be driven into bankruptcy, and it is clear that something must be done to remedy this evil. I think the solution is as given above—combine against the gas companies and sell to dealers only.



The Farwell Molding Machines.—Portable Machine.

The Farwell Molding Machine.

The accompanying engravings illustrate two types of the Farwell universal molding machine, made by the Adams Company, Dubuque, Iowa. The machine combines the "squeezer" feature of the plain molding presses with the pattern drawing feature. They can be used either with or without stripping plates. When used with the stripping plate, the pattern, which is secured to a frame, rests firmly on the machine table, and the stripping plate rests on the pattern frame. It will be observed, therefore, that both pattern and stripping plate do not rest on the lift table, but are supported by the rigid machine table, where they can well withstand the ramming and pressing of the sand. The stripping plate is supplied with studs that extend down and rest on the lift table. When the lift lever is operated the lift tables are raised, thus raising the stripping plate and drawing the pattern.

When this feature is used without stripping plate it is called the "lift off" method. These patterns, like stripping plate patterns, are necessarily in two sets, one for copes and the other for drags, unless the work is of the symmetrical type and both copes and drags can be made from the same half pattern. The half patterns are secured to a plate. Studs resting on the lift tables extend up and pass loosely through the pattern plate and engage with the flask. When the lift lever is operated

Stationary Machine.

and the lift tables raised the flask is lifted off the pattern.

The stationary machine is 30 inches between the side rods, and the lever is adjustable from 20 to 40 inches. It will take in flasks up to 24 inches in length, 18 inches in width and 10 inches in depth. The portable machine is 38 inches between the side rods, and is adapted to flasks up to 32 inches in length, 18 inches in width and 10 inches in depth.

AID FURNACEMEN.

BY I. E. D.

I am very much pleased to note that *The Metal Worker* of March 15 contains some very pointed letters on furnace work by "S. D.," "S. N. D.," and "H. M. K." If all who do work with hot air furnaces would only contribute their experiences, those who set furnaces could in a year or two have the furnace business up to the high plane where it should be. It does not hurt my feelings to be criticised, for there is not a letter written that could not be remodeled to advantage, so don't let us who read the letters take exception to them and use the valuable columns of *The Metal Worker* for a mere criticism of another's methods. After you have read what a contributor has to say, if you do not like his style of furnace setting, just forget that part of it which does not agree with you, and in order to offset what you consider wrong write for the next issue a letter explaining your ideas, remembering that some who read the paper have not had the same experience that others have. There may be others who would be a great deal more interested in your ideas on setting furnaces than in your criticism of another furnaceman's contributions.

If those who are engaged in furnace work, from the tinsmith to the more experienced man in the office, who does the designing, will study what is presented in *The Metal Worker*, and save these articles for reference, they can, in a few years, have a knowledge of the furnace business that will make them sought when any furnace contractor wants to hire a man. There will be less inquiry as to where a good A1, first-class furnaceman can be had, and only such men are wanted. The first-class furnaceman will then be in demand and will have no difficulty in being properly paid, with satisfaction to himself, his employer and the customers of the house.

Apprenticeship Ratio in the Foundry Trade.

The *Iron Molders' Journal* announces the result of the referendum vote upon four propositions recently submitted to the members of the Iron Molders' Union of North America on the question of apprenticeship. The proposal to change the apprenticeship ratio from 1 to 7 to 1 to 5, with one apprentice for the shop in either case, was defeated by the overwhelming vote of 15,842 against 504 in favor. The proposal to permit members of the Stove Founders' National Defense Association, who cannot after five days' notice obtain a sufficient supply of competent journeymen molders, to increase the number of apprentices to the requirements of their business, where the presidents of the Iron Molders' Union and the S. F. N. D. A. agree that sufficient force is not at hand to do required work, was defeated by almost as large a majority as the first, the vote being 527 in favor and 15,446 against. A third proposition, which provides that molders in S. F. N. D. A. shops shall not be required to work with a helper, or "buck," and that the number of helpers shall not be increased, the object being the ultimate discontinuance of the system, was defeated, 7433 voting in favor and 8148 against. Proposition No. 4, empowering the officers of the union to negotiate an agreement on some other ratio of apprentices than 1 to 5, in case Proposition No. 1 is defeated, was lost, 3978 voting in favor and 12,314 against.

As the result of reorganization of the executive of the Bridge & Beach Mfg. Company, St. Louis, Mo., consequent on the death of George H. Holland, vice-president and manager of the company, the following officers have been elected for the ensuing year: President and treasurer, Hudson E. Bridge; vice-president and manager, Ralph S. Buck; second vice-president and secretary, William McCalpin.

The Furnace Work Record.

It will probably be a very agreeable surprise to some of our readers that we are enabled to present a copy of the Furnace Work Record filled out with the data in reference to the heating of six different buildings. The data presented herewith will doubtless be studied by some furnacemen with considerable interest and will serve to demonstrate to them the value that such a record of their work would prove, as well as to show that it is not such a difficult thing to make the simple calculations necessary to fill out the table. The Furnace Work Record was originally presented simply as a suggestion for the furnace trade to utilize according to their judgment of its value. The hearty indorsement it has received by some men in the trade is evidence that it is of some value, and we have no hesitation in saying that all who use it will be induced to give more careful notice to the many important details bearing on successful furnace heating.

Many furnace manufacturers have expressed themselves as doubtful if many who are engaged in furnace work, or who set but few furnaces during the year, will take the trouble to rule upon a piece of blank paper a chart or record and fill it in. We have already stated in *The Metal Worker* that we have a few enlarged blanks which can be secured by those who might desire to tabulate some of their work. To those who have stated that the average furnaceman could not make the calculations we would say that we think they have underestimated the intelligence of the large majority of men engaged in setting furnaces. Possibly they have a more correct idea of the disposition of furnacemen to go to the trouble of doing this work.

In addition to the records presented herewith, we have received other blanks partially filled in, and should be glad to secure the record of three or four more pieces of work, in order to enable us to present further data. As any good that comes from a better knowledge of how to properly proportion a furnace heating system is beneficial to furnace manufacturers, we are glad to note that many manufacturers encourage the use of the suggestion contained in the Record. We propose to present in due season some of the suggestions for its improvement.

Burners for Gas Stoves.

A patent has been taken out in Great Britain to improve the burners of gas stoves and to render them more durable and efficient. The statement filed in the English Patent Office is as follows: A burner for a gas fire consists of a tube divided longitudinally into an upper and a lower part, the two parts being pressed from sheet metal and secured together by folding their adjoining edges one upon the other. To prevent corrosion the upper part of the burner may be of brass, aluminum or other nonrusting material, or the burners may be enameled, galvanized or treated by any rust preventing process. In some cases, in order to prevent "lighting back," it is proposed to insert between the upper and lower parts of the improved burner one or more layers of wire gauze extending entirely along the burner and dividing the interior space into two parts, the gas being introduced in the lower one.

The American Vapor Stove Company, Detroit, Mich., have amended their articles of association, in order to increase the capital stock of the company from $100,000 to $150,000, by adding $50,000 of preferred stock. This new issue is held by Joseph P. Standart, Herman D. Kallar, Thomas E. Robinson, William F. Metcalf, Edwin J. Mummery, William J. Bert and William J. Hastle.

THE METAL WORKER RECORD OF FURNACE WORK.

If this blank is filled out as shown by the example given below, it will serve as a valuable guide in planning other furnace jobs.

ODD PLATES.

The J. W. Paxson Company of Philadelphia, manufacturers of Foundry Facings and Supplies, &c., have opened a branch, under the charge of W. Scott Thomas, in the Union Trust Building, Baltimore, Md.

The Cuyahoga Stove Repair Company are building a factory on Union street, Cleveland, Ohio.

The Gobeille Pattern Company, Cleveland, Ohio, announce that Charles H. Meigs, for some time secretary of the company, is no longer connected with them in any capacity.

The Ohio Stove Foundry, Portsmouth, Ohio, will erect an addition to their molding room, 60 x 100 feet, which will give accommodation for 20 additional molders.

The Cleveland Automatic Molding Machine Company have been incorporated with $10,000 capital. George F. Knash, L. A. Ritzman, J. W. Butterfield, J. W. Burrell and W. E. Patterson are the incorporators.

H. A. Perkins has resigned his position with the Brooklyn Firebrick Works, Brooklyn, N. Y., and has associated himself with J. Perkins of Rutland, Vt., under the name of the Newton & Perkins Firebrick Works, Albany, N. Y.

The Eureka Steel Range Company have been incorporated at O'Fallon, Ill., with a capital of $5000, to manufacture Stoves and Ranges. The incorporators are William G. Willard, Augusta Willard and Willard G. Willard, Jr.

The Robinson Furnace Company, 107 Lake street, Chicago, are enjoying a very heavy Furnace trade, which has thus far run considerably in excess of the corresponding period of last year. This business has included practically no large sales, the great volume of small sales showing the generally prosperous conditions prevailing throughout the Furnace trade. They find the demand running very strongly to their Tubular Furnace, which is making a fine record, every season adding to the number of users who are pleased with its efficiency. Robert Robinson of this company is arranging to build a fine residence for himself at Oak Park, one of Chicago's choicest suburbs. This residence will, of course, be heated with a Tubular Furnace.

A convenient little catalogue of the Ranges, Heaters and Grates made by them has been received from Jones & Campbell, Torwood Foundry, Larbert, Stirlingshire, Scotland. The catalogue consists of 60 pages bound in a red cloth cover, and is suitable for vest pocket use, being 2¾ x 5¾ inches in size. In addition to the Stoves and Heaters, the catalogue shows Mantels and a variety of Lavatory Stands and Frames.

James Winfield Foote died from pneumonia at his residence, 181 St. John's place, Brooklyn, N. Y., on Friday, March 21, in the fifty-fifth year of his age. Mr. Foote was the president of the Æolipyle Company, and had become well known to the heating trade through the introduction of the Æolipyle Draft Regulator. He is survived by his widow and one daughter.

The Columbus Stove Company, recently organized with a capital of $50,000 by F. B. Everett, J. W. Hastings, J. C. Campbell, L. E. Jones and B. A. Welling, are rebuilding the old Eagle Foundry, on West Main street, Cincinnati, Ohio, and adapting it for the manufacture of Steel Ranges. The company also propose to do a jobbing business in miscellaneous Castings.

Michael B. McDowell of Altoona, Pa., inventor and manufacturer of the Altoona Hot Air Furnace, died on March 16, aged 64 years.

A neat folder is sent out by the Pennsylvania Stove Company of Ellwood City, Pa., announcing to the trade that they have been organized and are now ready for business. The officers of the company are the following, all of whom were members of the old firm of De Haven & Co.: Lyman W. De Haven, president; John A. Roe, treasurer, and Edwin A. Fisher, sales manager. They are making a full line of Cast Ranges, Cast Cooks, Steel Cooks, Steel Ranges and Heating Stoves of all descriptions.

An auction sale of the stock and chattels of the Chesapeake Stove Company of Baltimore, Md., was held last week on the premises formerly occupied by the company at the corner of Scott and Cross streets. The sale was held on the order of Richard B. Tippett and Emil Budwitz, receivers of the concern. Included in the articles offered for sale was a considerable stock of Stoves, Stove Fittings, Tinners' Tools and other articles. The company's plant was offered for sale at the same time by the auctioneers, but was withdrawn, as no satisfactory bids were received.

The Keystone Foundry & Mfg. Company have been organized by a number of Homestead and McKeesport men who have purchased the plant of the McKeesport Foundry at Versailles, Pa. The plant will be doubled in size and remodeled for the manufacture of Stoves and Ranges. The new concern have a capital of $50,000. H. A. Monath of Homestead is the president, and M. F. Fisher of Hays secretary and treasurer.

A special meeting of the stockholders of the Reading Stove Company of Reading, Pa., will be held on May 15, when a proposition to increase the capital stock of the company from $400,000 to $600,000 and to issue preferred stock for the increase will be considered.

The Progress Furnace & Stove Company of Springfield, Ohio, whose plant was recently destroyed by fire, have leased the Mark Smith factory in that city, formerly occupied by the Rogers Iron Company.

J. C. Parmerlee of Sedalia, Mo., the inventor of the Parmerlee Down Draft Heating Stove, is contemplating the establishment in Sedalia of a plant to manufacture his invention, provided he is able to secure sufficient backing from local capitalists.

The March-Brownback Stove Company of Pottstown, Pa., held their annual meeting in the company's office in that city last week, when the present directors were re-elected, as follows: Franklin March, T. J. March, A. K. Shaner, James Brownback, Dr. J. E. Porter, Mifflin W. Baily and James Rodgers. The Board of Directors re-elected the old officers, as follows: President, Franklin March; vice-president, James Rodgers; treasurer, T. J. March; secretary, Horace M. Ebert. It was decided to authorize the Board of Directors to sell the property of the company located at Parkerford, and to sell or lease their plant at Linfield, as the board deemed best.

The United States Register Company, Limited, Battle Creek, Mich., have issued a neat 16-page pamphlet in the interests of the Jones Side Wall Warm Air Register, of which they are the manufacturers. This Register was recently illustrated and described in our columns. It is characterized as a combination of a Register, Register Border, Double Register Box, Deflector and Foot Warmer, which is patented by the inventor, A. O. Jones. The pamphlet contains a number of flattering testimonials from those who have used this Register. It also gives a price-list and tables of sizes and dimensions, together with a complete description of the device.

No less than 52 buildings of private ownership in New York City are assessed for 1902 at a valuation of $1,000,000 or more. Two of these are assessed at over $6,000,000, one at $4,700,000, four at $3,000,000, ten at $2,000,000 to $2,800,000 and the rest at from $1,000,000 to $1,800,000. Most of these are large down town office buildings, but hotels and large apartment houses also figure in the roll.

At the bi-monthly adjustment of the bar iron scale, held at Youngstown, Ohio last week, no change in the present wages paid the members was authorized. At the present rate puddlers are receiving $5.75 per ton. It is probable that for the months of May and June the men will receive an advance, however, owing to recent advances in the price of bar iron.

NATIONAL RETAIL HARDWARE DEALERS' ASSOCIATION.

The third annual meeting of the National Retail Hardware Dealers' Association was held in the Palmer House, Chicago, on Wednesday and Thursday of last week, March 19 and 20. The following delegates from the various State associations affiliated with the National organization were present:

ARKANSAS: John M. Pittman, Prescott.
ILLINOIS: H. G. Cormick, Centralia; L. H. Clark, Rockford; Z. T. Miller, Bloomington; William T. Gormley, Chicago.
INDIANA: W. P. Lewis, New Albany; M. L. Corey, Argos; Irving A. Sibley, South Bend; Sharon E. Jones, Richmond; H. Burkert, Gosport.
IOWA: W. A McIntire, Ottumwa; W. H. Keating, Ottumwa; H. A. Cole, Council Bluffs.
KENTUCKY: Paul Wagner, Louisville; Joseph C. Kirchdorfer, Louisville; J. C. Frederick, Owensboro.
MICHIGAN: Geo. W. Hubbard, Flint; Henry C. Weber, Detroit; Charles F. Bock, Battle Creek.
MINNESOTA: W. H. Tomlinson, Le Sueur; Charles F. Ladner, St. Cloud; J. F. McGuire, St. Paul.
MISSOURI: Fred. Neudorff, St. Joseph.
NORTH DAKOTA: H. N. Joy, Hamilton; C. N. Barnes, Grand Forks.
OHIO: W. P. Bogardus, Mt. Vernon; George M. Gray, Coshocton; Frank A. Powers, Norwalk.
WISCONSIN: O. P. Schlafer, Appleton; C. A. Peck, Berlin.

At the opening of the session on Wednesday morning, President W. P. Lewis read his annual report, which showed that five States—Arkansas, Pennsylvania, Wisconsin, Ohio and Minnesota—with a total membership of about 1100 had joined the National Association during the year, making together with the membership of the eight original States in the association a total membership in the national body of 2600 members.

Secretary M. L. Corey read his annual report, in which details were given of the work done during the year, and specific mention was made of the progress accomplished in securing correction of some of the troubles which beset the retail merchants.

The president announced the appointment of the following committees:

CONSTITUTION AND BY-LAWS: W. H. Tomlinson, Minnesota; Fred. Neudorff, Missouri; F. A. Powers, Ohio; Paul Wagner, Kentucky; John M. Pittman, Arkansas.
RESOLUTIONS: C. A. Peck, Wisconsin; W. A. McIntire, Iowa; W. P. Bogardus, Ohio; Charles F. Bock, Michigan; C. N. Barnes, North Dakota.
NOMINATIONS OF OFFICERS: Sharon E. Jones, Indiana; O. P. Schlafer, Wisconsin; H. N. Joy, North Dakota; Jos. C. Kirchdorfer, Kentucky.
PRESS: Z. T. Miller, Illinois; H. G. Cormick, Illinois.
AUDITING: Irving A. Sibley, Indiana; H. A. Cole, Iowa.

On Wednesday afternoon Treasurer H. C. Cormick presented his report, which showed the association to have discharged the indebtedness carried over from the preceding year and to have sufficient balance to cover current expenses. The convention then proceeded to a discussion of the various subjects connected with the annual report. It was decided to issue an annual manual, and the decision was also made that a national fire association should be organized in connection with the work of the association. The question of the payment of a salary to the president, treasurer and secretary was referred to the Executive Committee.

The greater part of the session on Thursday morning was consumed in the general discussion of subjects of immediate interest to the association, involving questions relating to the constitution and by-laws, and the relations of the various trade elements to each other. No action in this line was taken which is of public interest. A vote of thanks was tendered to the officers who had so ably and efficiently served the association during the past year.

A pleasant feature of the afternoon session was the presentation made to President Lewis by Mr. Cormick of the contents of an envelope, to be given by Mr. Lewis to his bride for the purchase of a memento of the kindly feeling entertained for President Lewis by his fellow members of the association. The presentation was acknowledged by Mr. Lewis in feeling terms.

The secretary reported that the Committee on Nominations had made the following nominations:

For president, H. G. Cormick, Centralia, Ill.

For vice-president, C. N. Barnes, Grand Forks, N. D.

On motion, the secretary was instructed to cast a ballot for the gentlemen nominated, who were declared elected. The secretary then read the nomination of members to act as the Executive Committee for the ensuing year, and on motion the following were unanimously elected:

W. P. Bogardus, Mt. Vernon, Ohio.
O. P. Schlafer, Appleton, Wis.
C. F. Ladner, St. Cloud, Minn.
W. A. McIntire, Ottumwa, Iowa.
Sharon E. Jones, Richmond, Ind.

Other matters of interest were then discussed, and at the close of the session President Cormick made an interesting address, after which the convention adjourned, subject to the call of the Executive Committee. At the conclusion of the convention the Executive Committee met and re-elected M. L. Corey of Argos, Ind., secretary, and selected W. P. Bogardus, Mt. Vernon, Ohio, as treasurer for the ensuing year.

On Wednesday evening the delegates in attendance at the convention enjoyed a banquet at the new Hardware and Manufacturers' Club, which was tendered them by W. H. Bennett of the Reading Hardware Company; D. W. Simpson of the Wilcox Mfg. Company, and J. D. Warren of the J. D. Warren Mfg. Company. A feature of the banquet was the complete absence of wine, which was the subject of approving remarks by the guests After coffee and cigars, Mr. Bennett assumed the role of toastmaster, and called upon a number of those present for remarks.

Among those who responded to his call were: D. W. Simpson, Ex-President Lewis, Irving A. Sibley, H. G. Cormick, M. L Corey, C. A. Bock, H. N. Joy, W. A. McIntire, W. H. Tomlinson, W. P. Bogardus, H. H. Roberts, S. T. Johnston, C. A. Peck, Paul Wagner, J. F. McGuire, W. T. Gormley, John M. Pittman, S. E. Jones and Geo. W. Cope. The speeches made by the delegates were unusually bright and entertaining, and the banquet room was not deserted until a late hour.

The Proposed Consolidation of Hardware Jobbers.

There have been many rumors during the week in regard to the proposed consolidation of jobbing interests, and constant conferences, at which many prominent houses were represented, have been held in this city. Reports have been given currency in the daily press that the leading houses in the trade are to be parties to the movement, but it is impossible to ascertain what foundation there is for such rumors, as the houses do not confirm or deny the reports. It is understood that this is a critical time for the project, as options expire April 1, so that if anything is done it must be done without delay. Those active in the matter express the utmost confidence that the effort will be successfully consummated, but in what form it will be no intimation is given.

Aluminum Cooking Utensils.

The Aluminum Cooking Utensil Company, Pittsburgh, Pa., of whom Dr. Charles E. Zeigler is the general manager and J. H. Wilson general sales agent, have issued a new illustrated catalogue of the aluminum cooking utensils which they are manufacturing. The catalogue is a 32-page publication, gotten up in tasteful style, the letterpress being in two colors and the illustrations consisting of excellent half-tone reproductions of the various goods manufactured by the concern, who claim to make the largest and most complete line of aluminum cooking utensils in the country. In an introductory note the advantages of aluminum for household ware are set forth at length, and the statement is made that whereas in the early experimental days of the metal some vessels were made so thin that they became dented and were easily damaged, the Aluminum Cooking Utensil Company are now making their wares of the necessary thickness to enable them to withstand all the vicissitudes of wear and use. Among the goods shown in the catalogue are Handy kettle steamers, Handy saucepans, lipped saucepans, Berlin saucepans, preserving kettles, Wind-

sor kettles, double boilers, tea kettles, waffle molds, odorless frying pans and griddles, pudding and cake pans, cake molds, muffin pans, lemonade shakers, tea steepers, wash basins, trays, funnels, plates, dinner pails and cuspidors; also the patent Ideal percolating coffee pot and the Matchless coffee pot, which are specialties of the concern. The Aluminum Cooking Utensil Company are a branch of the United States Aluminum Company. Their factory is equipped with the latest improved machinery specially adapted for the manufacture of this class of goods. The company are making special efforts to produce the highest possible grade of ware.

Stand for Covers.

In the store of Hale & Kelsey, Middletown, Conn., is a home made stand for holding covers, as shown in Fig. 1. A 1-inch base board, 17 inches square, rests on the narrow sides of two 2 x 4 joists. From the

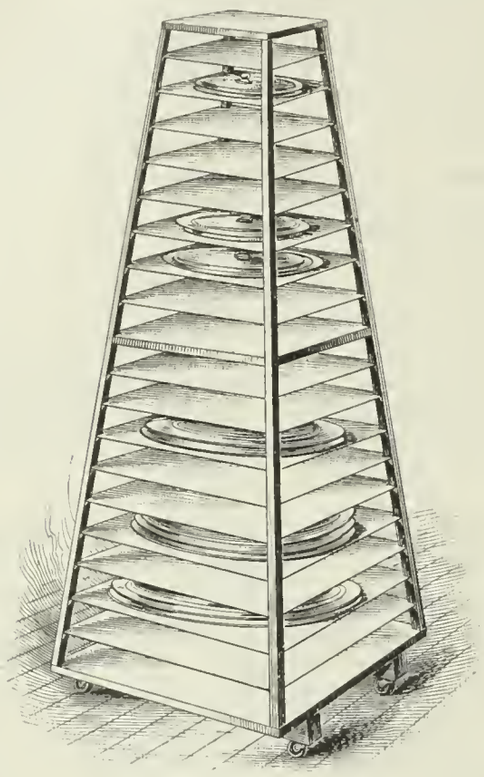

Fig. 1.—Stand for Covers.

corners of this base board are erected two corner posts, 1 inch square, which step in a top board of 1-inch stuff measuring 11 inches square. About half way from the bottom board to the top board is placed a ½-inch wooden shelf to stiffen the construction. At intervals of about 3 inches between this and between the top and

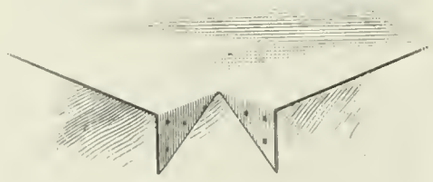

Fig. 2.—Construction of the Corners of Shelves.

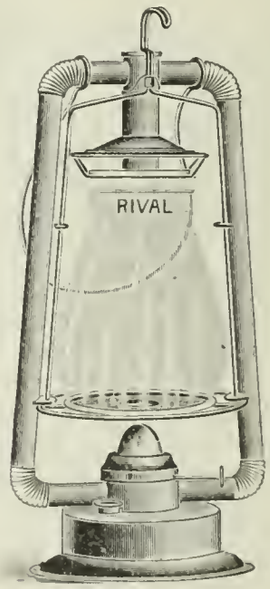
bottom boards are placed 16 shelves made of tin plate. The edges are turned and flattened down. Then a short cut is made in each corner on the diagonals and the corners are bent down as shown in Fig. 2. The sheets are then tacked to the uprights through the bent down surfaces, completing a useful and inexpensive piece of store furniture.

Mueller & Brown have just opened up in Shelf Hardware, Farm Implement, Stove and Paint business in Abilene, Texas, and would be glad to receive catalogues, price-lists, &c., relating thereto. Mr. Brown was formerly in the same line at Munfordville, Ky.

Galvanized Oily Waste Can.

The Steel Basket Company, Cedar Rapids, Iowa, have added to their galvanized specialties the oily waste can which is herewith illustrated. The can is corrugated, and has a riveted double bottom raised 4 inches from the floor. It is provided with a self closing metal cover, and is offered to the trade as a thoroughly safe receptacle for oily rags and waste, which are of a highly in-

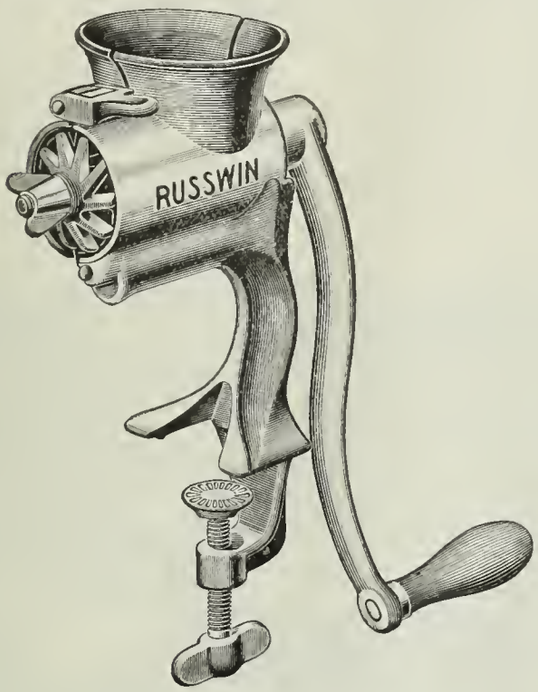


Galvanized Oily Waste Can.

flammable character. The can is regularly made in six sizes, but other sizes can be furnished to order. The company are making corrugated galvanized cans, pails and baskets. Their baskets are now made with a double bottom, strongly riveted all round, having no straps or rough places to injure clothing or shoulders.

Rival Tin Tubular Lantern.

The Berger Mfg. Company, Canton, Ohio, are the makers of the Rival tin tubular lantern, here illustrated. It is made for ⅝ and 1 inch wicks, as here shown, also with plain and bull's eye globes for dashboards.



Rival Tin Tubular Lantern.

It has a locked burner, simple top lift, patent one-piece crimped tubes and retinned, tested founts. The regular size is packed one dozen in a case, weighing, ready for shipment, 36 pounds.

The next annual meeting of the Texas Hardware Jobbers' Association will be held in Fort Worth, April 21 and 22. The headquarters will be at the Worth Hotel.

Russwin Food Cutter.

Russell & Erwin Mfg. Company, New Britain, Conn., and 43-47 Chambers street, New York, have just begun the manufacture of the Russwin food cutter, here illustrated. This food cutter is made in two sizes, Nos. 1 and 2, for family use, the No. 2 being the larger of the two. Four cutters in all are furnished, three of which are similar to the one seen in the illustration, except that they vary as to product, fine, medium and coarse, the remaining cutter being of a different character for grinding nuts into a pastelike mass or butter. This cutter is

Russwin Food Cutter.

practically in two parts; the worm screw and cutter and the hinged shell, held together at the top by a pivoted loop. There is a gutter underneath a part of one shell to catch juice of meat, fruit or vegetables and conduct it so as to drop with the cut material into the receptacle used for that purpose. The cutter can be opened instantly and cleaned quickly. It stands well above the table and permits of the use of a large dish. It is self sharpening, and is said not to squeeze the material treated, but actually cuts it. The cutter is tinned, and can be readily attached to table or shelf.

Standard Spray Pump.

The Admiral Lamp Company, Marysville, Ohio, are manufacturing the Standard spray pump, here shown, Fig. 1 illustrating the pump as in use and Fig. 2 being a

Fig. 1.—Standard Spray Pump.

sectional view of the working parts. The pump is made entirely of brass, with two solid brass ball valves, and is 27 inches long. There are no leathers, washers or suckers, or castings to rust and produce leaking joints. It can be used with bucket, knapsack, tank or barrel for spraying orchards, gardens and vineyards; also for whitewashing, disinfecting chicken houses and extinguishing small fires. With the pump are provided two

Fig. 2.—Sectional View of Working Parts.

interchangeable nozzles, No. 1 throwing a solid stream 50 to 60 feet. No. 2 attached to No. 1 throws a fine spray 28 feet, while No. 2 attached direct to the pump throws a coarser spray 40 feet. The company can also furnish a kerosene attachment, which is so constructed that the quantity of oil used can be instantaneously adjusted.

Stove and Hardware Dealers.

JOHN KERR has bought the Hardware, Stove and Sporting Goods business of Weiner & Link, Burt, Iowa.

ED. C. WHITLOCK has purchased a stock of Hardware at Kinross, Iowa, and will also handle Stoves, Bicycles, Pumps, &c., operating a tin shop for roofing and general repairing. He desires catalogues and price-lists.

ANNOUNCEMENT is made that the twelfth annual convention of the Southern Hardware Jobbers' Association will be held at Atlantic City, N. J., June 17-20 next.

B. L. SPOFFORD, Wareham, Mass., has opened a store at 876 Main street, Coburn Block, and will deal in Hardware, Paints, Oils, Crockery, Tinware and Lamps.

THE ELECTRIC CHAIN COMPANY, Attleboro, Mass., who manufacture small Chain for jewelers' use, have recently extended their line and are finding a market for some of their product among manufacturers. They are producing Brass and Iron Chain by machinery from wire of from 21-1000 to 57-1000 gauge. This Chain is produced by special machinery under a new process and it is claimed to be the strongest unsoldered Wire Chain made. They have a variety of styles and are prepared to make special Chain to order.

THE ANDREW B. HENDRYX COMPANY, New Haven, Conn., have just issued their illustrated catalogue, which is bound in red leather, gilt edged and divided into three sections, with a separate index for each. The first 175 pages describe a large line of Bird and Animal Cages, Cage Specialties and the following styles of Chain—viz., Curb, Safe, Ladder, Plumbers', Safety and Single and Double Chains made variously of bronze, brass and iron. The next section, paged 1 to 111, treats exclusively of Fishing Tackle Reels, and is separately indexed. The balance of the book, pages 112 to 192, inclusive, relates to Spoon Baits, Fly Spoons and Feather Hooks in great variety.

GEORGE WILLIAM HOFFMAN, 295 East Washington street, Indianapolis, Ind., is sending out a circular inclosing in a small tin box a sample of Hoffman's Infallible U. S. Metal Polish Paste, which is adapted for cleaning and removing the tarnish from all kinds of metal goods, from fine silver to tinware and machinery mountings.

THE TOWER MFG. COMPANY, Madison, Ind., have added to their former line of Tacks, Nails, Staples, &c., Coopers' and Tinners' Rivets and Coppered and Tinned Belt Rivets and Burrs and Washers. They have also lately put on the market two very attractive packages of Carpet Tacks under the names of Excelsior and Pan-American Tacks. All of the above, together with their former line, are shown in a new catalogue recently issued by the company.

THE FISCHER-LEAF COMPANY of Louisville, Ky., manufacturers of Mantels and dealers in Stoves and Ranges, announce that they have sold their retail business at 433 to 435 West Jefferson street to the new firm of Brecher & Buck, who will move their offices to their factory at Sixteenth and High streets, Louisville. The new firm are composed of C. P. Brecher, formerly vice-president of the Fischer-Leaf Company, and G. W. Buck.

THE new galvanizing plant of the Lalance & Grosjean Mfg. Company at Woodhaven, L. I., is approaching completion, and it is expected to be in operation early next month.

THE auction sale of Enameled Ware in New York City last week attracted the largest attendance of dealers from all parts of the country that has ever been known on a similar occasion. The bidding was exceedingly brisk and the prices obtained are said to have been entirely satisfactory.

D. S. ROMINE has bought the Hardware, Stove and Agricultural Implement business of La Baw & Co., Bartlett, Kan.

THE BEST STOVE COMPANY is the title of the new firm who have taken over the retail Stove and Tinware business of George Stethem, at Peterborough, Ont., Canada. E. M. Best, formerly of Woodstock, Ont., is the head of the new concern.

THE HEATING AND VENTILATION OF THE EDWARD WYMAN SCHOOL, ST. LOUIS, MO.*

BY ALVIN D. REED.

That the proper heating and ventilation of modern schools is a matter of more than ordinary importance is well known to all members of this society, and as there are in school houses many special features of great importance in the construction of the building, such as the arrangement of rooms and wardrobes, light, stairways, &c., which prevent the planning and erection of an ideal system, the designer is frequently called upon to exercise considerable ingenuity in planning a system which, when completed, will not only give entire satisfaction to his clients, but be entirely satisfactory to himself.

It has been my custom to keep in very close touch with the drafting room when the planning of a new school or the reconstruction of an old building is commenced; and, in fact, the matter of heating and ventilating is always kept in mind at all stages and progress of the work. By this method a very much better system is planned than if no attention was given the heating and ventilation until all plans were finished.

In all new buildings, and when old buildings are to be reconstructed, arrangements are made to heat and ventilate by the low pressure steam and fan system. By low pressure I mean that not more than 15 pounds of steam is carried on the boiler, and lower pressure on the heating system maintained through reducing valves.

One of our latest buildings, the Edward Wyman School, two stories high, is shown in Fig. 1, with the greater part of the basement floor being above the grade level. This building contains 18 class rooms, a kindergarten and lecture room (each equal to two class rooms in area), a library, principal's office, teachers' rooms, toilet rooms, &c.

In the basement, shown in Fig. 2, are the boiler and coal rooms, the engine and fan room, the latrine rooms, and play rooms.

Each class room, as shown in Fig. 3, is provided with ample wardrobe room, and these rooms are arranged to receive outside light. The wardrobes differ from those of the ordinary school building inasmuch as they open off of the room only, having no communication with the corridors.

The building is of fire proof construction throughout. It is designed after the early English style, and the feeling has been admirably maintained by the use of a mottled brick with heavy gray joints. The building is finished in hard wood throughout, and the walls and ceilings are painted in lead and oil in pleasing and harmonious colors.

Total cost of finished building, $126,752. Cost of heating and ventilating only, $10,687.

The heating and ventilating plant consists of one horizontal tubular boiler, 72 inches in diameter, 22 feet long, containing 26 6-inch flues. The engine has cylinder 18 inches in diameter by 12-inch stroke, direct connected to the shaft of the fan wheel. The fan wheel is 11 feet in diameter by 5 feet 6 inches wide; and, as shown by plan and elevation in Fig. 4, is somewhat different from the general method of constructing double discharge fans.

It has been designed to give an even flow of air over the entire surface of the coils, and will be required to deliver 68,400 cubic feet of air per minute in order to comply with the guarantee. The heating of the air is accomplished by 12 coils, two coils being used as tempering coils, and five coils used in each heater stack. Each coil has four rows of 1-inch pipe. The pipes are spaced 3⅛ inches center to center lengthwise of the coil, and the rows are spaced 2½ inches center to center. The pipes are 7 feet high, or each coil has 1022 feet of 1-inch pipe; and the 12 coils have 12,264 feet of 1-inch pipe. The heaters and their connections are shown in Fig. 5.

The Heating and Ventilation of the Edward Wyman School.—Fig 1.—General View of the Building.

The base of the coil has been designed with a view of causing the steam and water of condensation to flow in the same direction in the base, and with a seal of water of 1½ inches at rear end, a current of steam upward in two of the rows of pipe, and downward, as it were, in the other two rows of pipe.

During the past winter a test of the coils has proved that they do not air bind. The water of condensation is drained out of the bottom of the base as shown, giving a dry base at all times, and is returned by gravity to a receiver, when it is pumped to the boiler.

At this school the air is drawn down through the two towers at each side of the main entrance, as shown in Fig. 1, thence through a passageway, when it passes

* Paper read at the semiannual meeting of the American Society of Heating and Ventilating Engineers, at Chicago, July 12, 1901.

either through or beneath the tempering coils. Under each of the tempering coils is placed a by-pass door which is caused to be opened or closed by a thermostat placed in the tempered air room to keep the temperature of the air when it enters the fan at 70 degrees.

rooms. The ducts leading to the class rooms have an area of 2 square feet; the vertical flues an area of 3 square feet; and the openings into the class rooms an area of 5 square feet.

A diffuser, shown in Fig. 5, is used on all fresh air

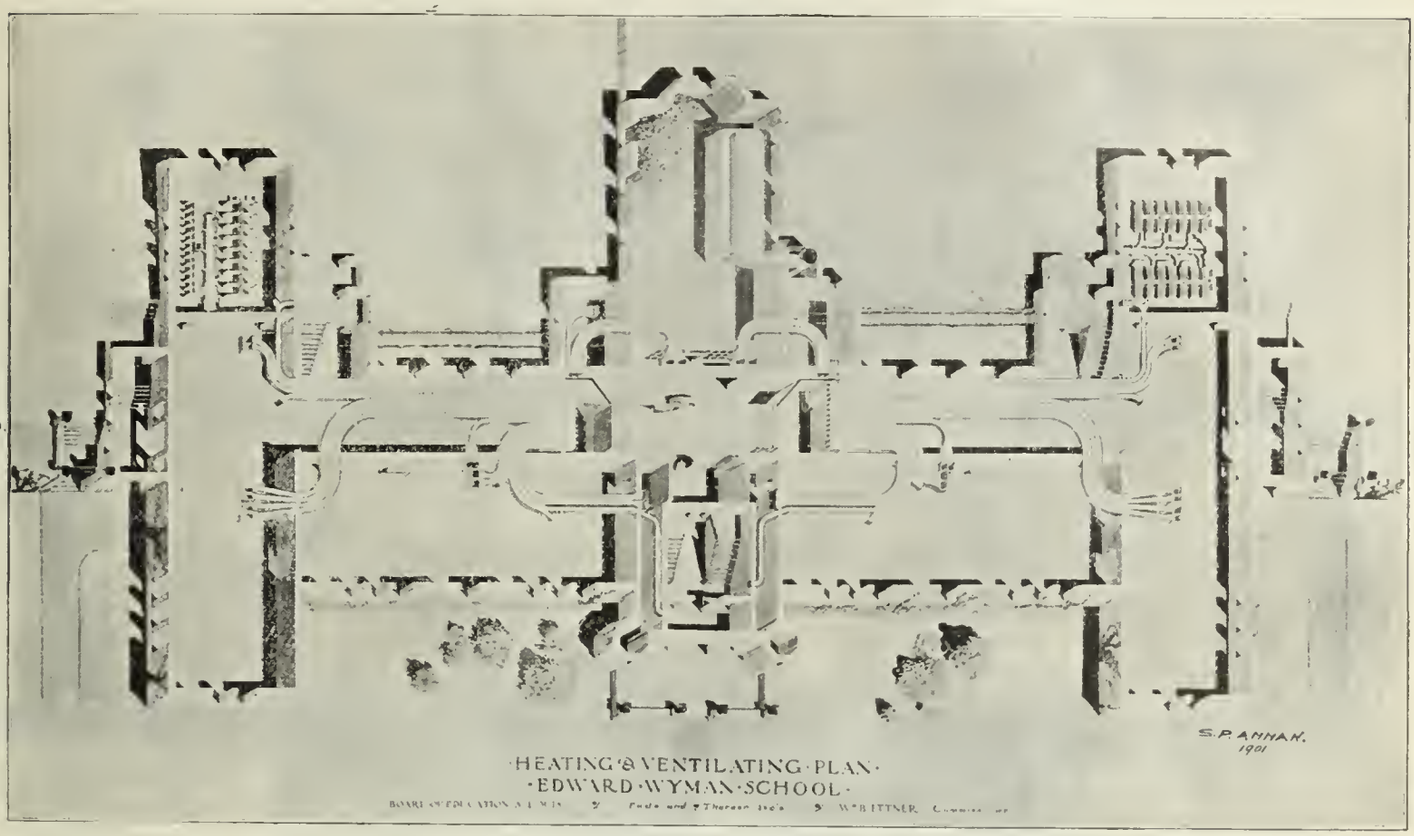


Fig. 2.—Basement Plan.

The air is then discharged from either end of the fan, either through or beneath the heating coils and into the hot room or the tempered air room, and thence into gal-

openings into the class rooms. These openings are located about 9 feet above the floor and, wherever possible in the planning of the building, arrangements are made

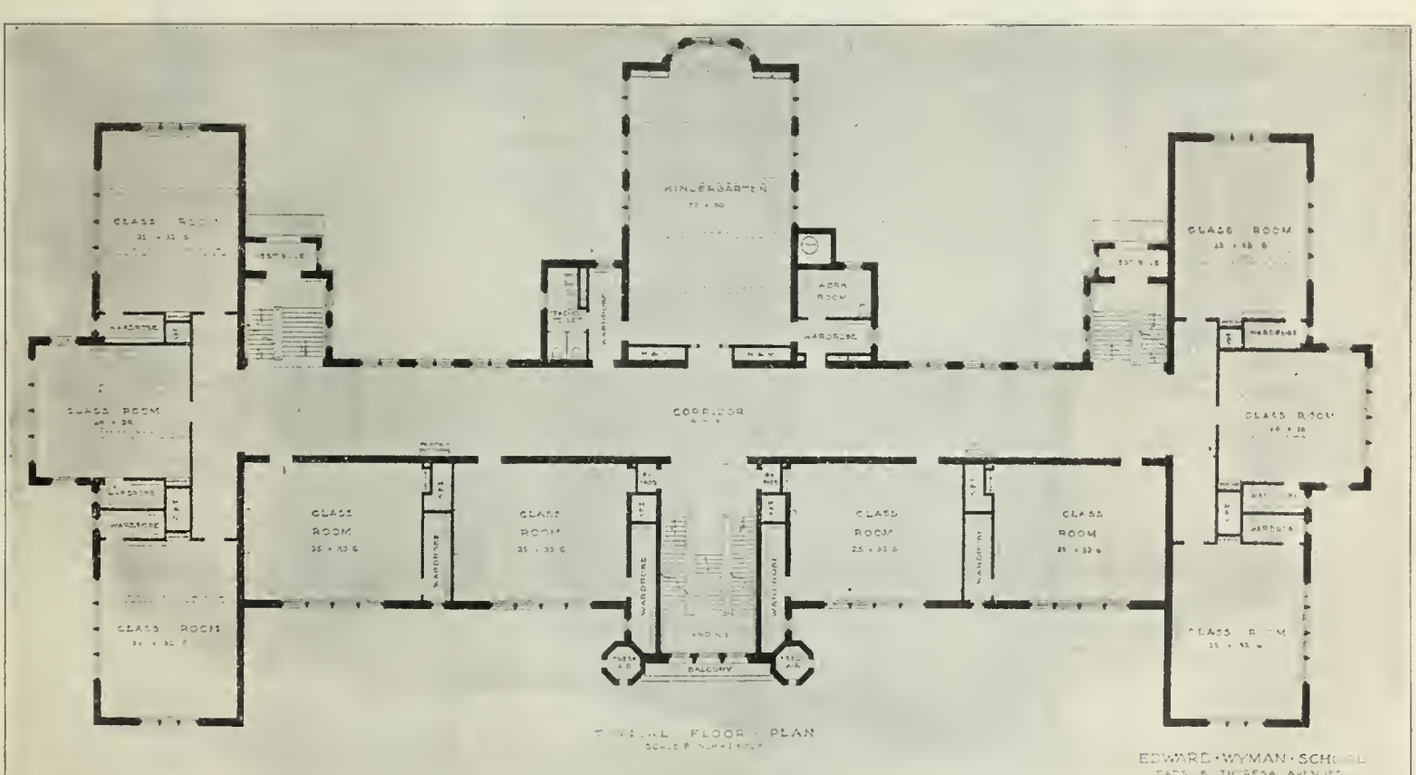

Fig. 3.—Plan of Different Floors.

vanized ducts hung near the ceiling, shown in Fig. 6, leading to each class room.

All class rooms have double connections at the plenum chamber, and these double dampers are controlled by thermostats placed in each of the class

to discharge the air toward the outer walls and glass surfaces; but, as was mentioned early in this paper, this cannot always be done, and under these circumstances a diffuser is found to be of great value in directing the air toward the outer and therefore colder parts of the

room. All vent registers have an area of 5 square feet and are in the wardrobes at or near the floor level. This is found to give a very excellent service.

The wraps of the children are hung on long hooks

This method of opening and closing the doors in the attic has its merits, as ropes, chains and pulleys will get out of working order; and under these circumstances it would be necessary that the janitor, in properly at-

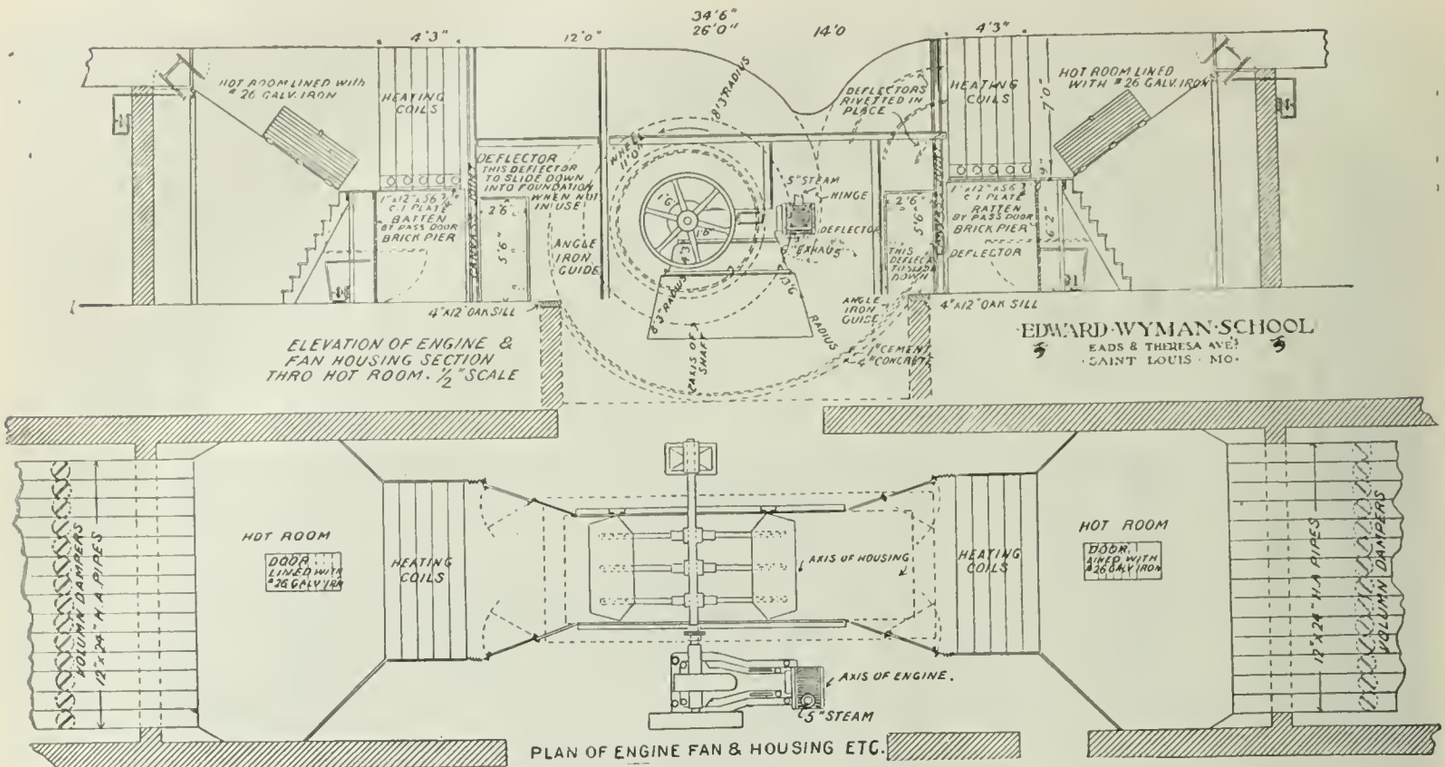

Fig. 4.—Plan and Elevation, Showing Fan, Engine and Heaters.

which prevent them from touching the walls, &c. The air passing through and around the clothing insures that it will be nice and dry when wanted for recess, or at dismissal. This is especially advantageous should the

tending to his duties, would have to climb the stairs to the attic. This he "might forget;" but with only a small three-way cock to open or close, I have never found this duty neglected.

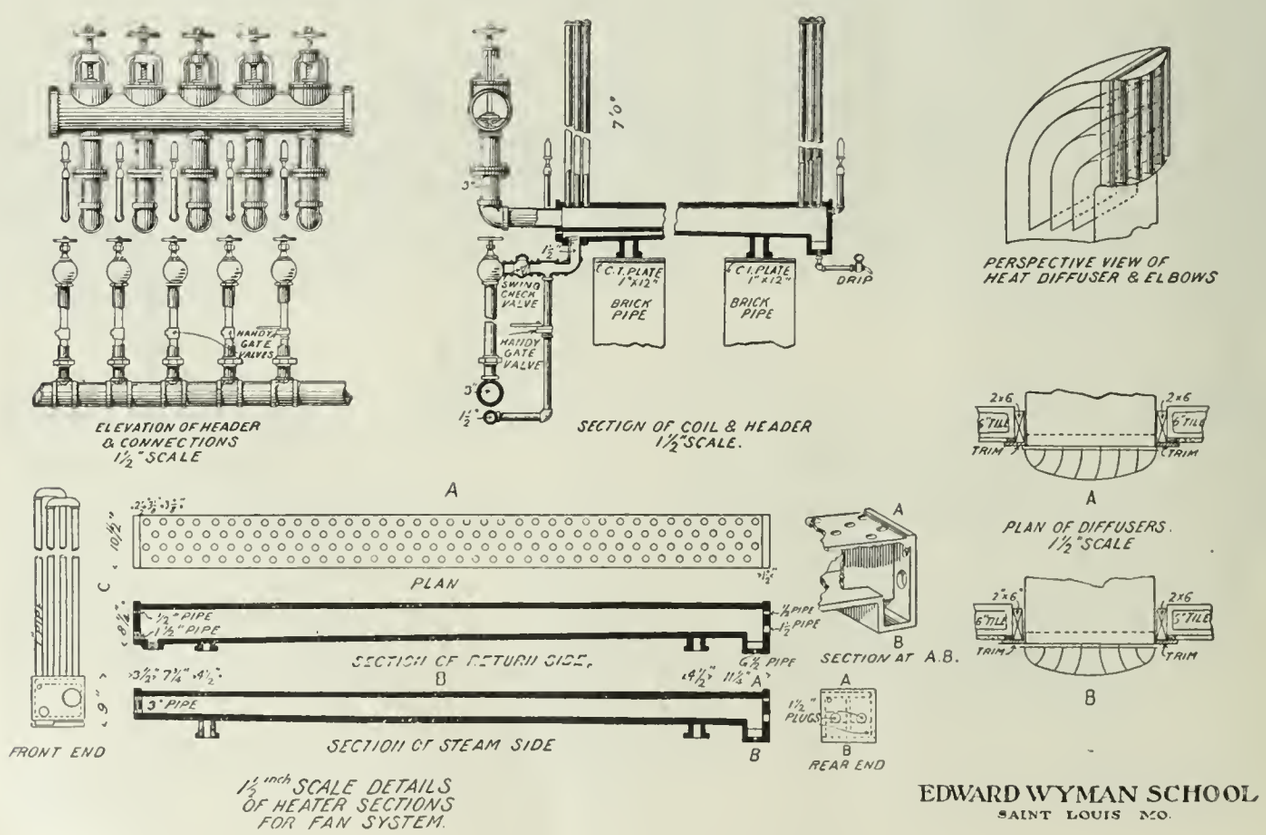

Fig. 5.—The Heaters and Diffusers.

children have been in the rain or snow on their way to school.

The vent flues lead to the attic, where the air is discharged to the outside through towers. Beneath these towers are usually placed two or more doors which are opened or closed by air pressure handled by a small three-way cock or valve located in the engine room.

A by-pass for the whole heating system is arranged as shown by Fig. 7, which shows the actual arrangement at one of the schools, and is used here to show the general scheme in all new schools.

At the point where the fresh air enters the basement from the towers is a door which is closed, and another door shown over the tempering coils connecting with

the first floor hall is opened. The class room doors are left open. When the fan is started a complete circulation of the air in the building is at once established. Not only is this found to be a very economical system of heating the building early in the morning, or at other times when not occupied for school purposes, but the work is accomplished very quickly.

A special form of header was designed for the steam connections to the coils, in order to reduce the number of joints and, consequently, the liability of leaks. Formerly this header was constructed of valves and fittings too numerous to mention, with all their numerous "kinks and twists" in order to get them to "come right." Its advantages can be easily seen.

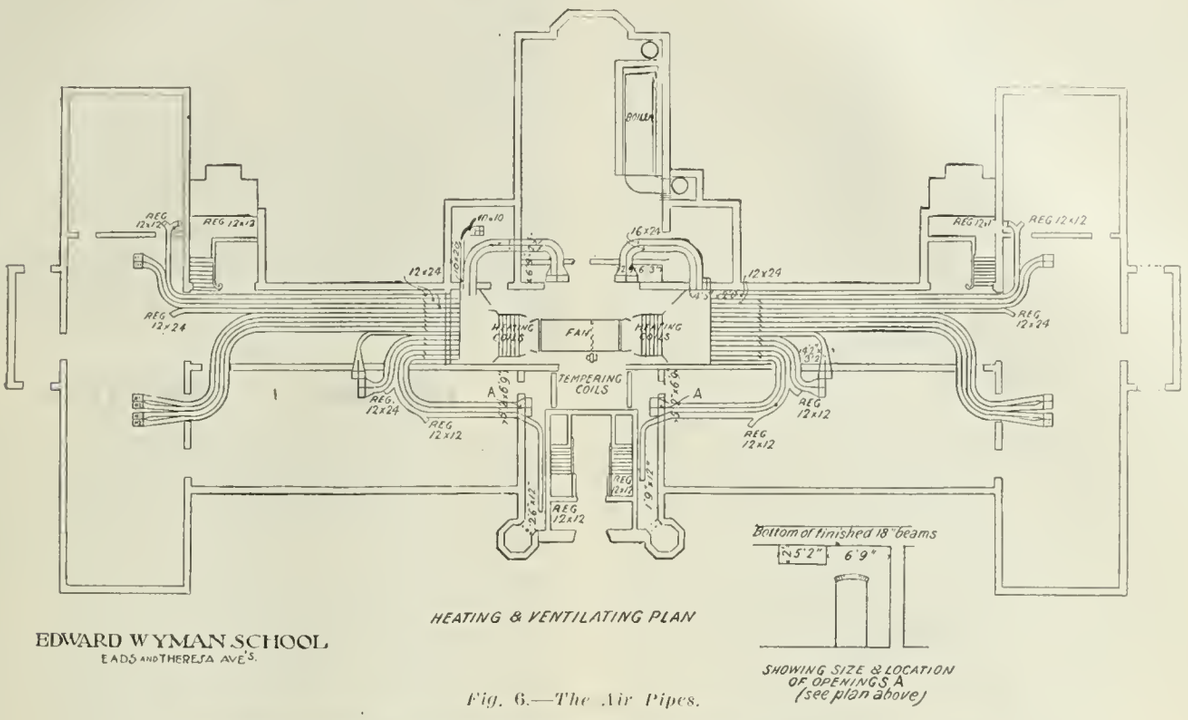

Fig. 6.—The Air Pipes.

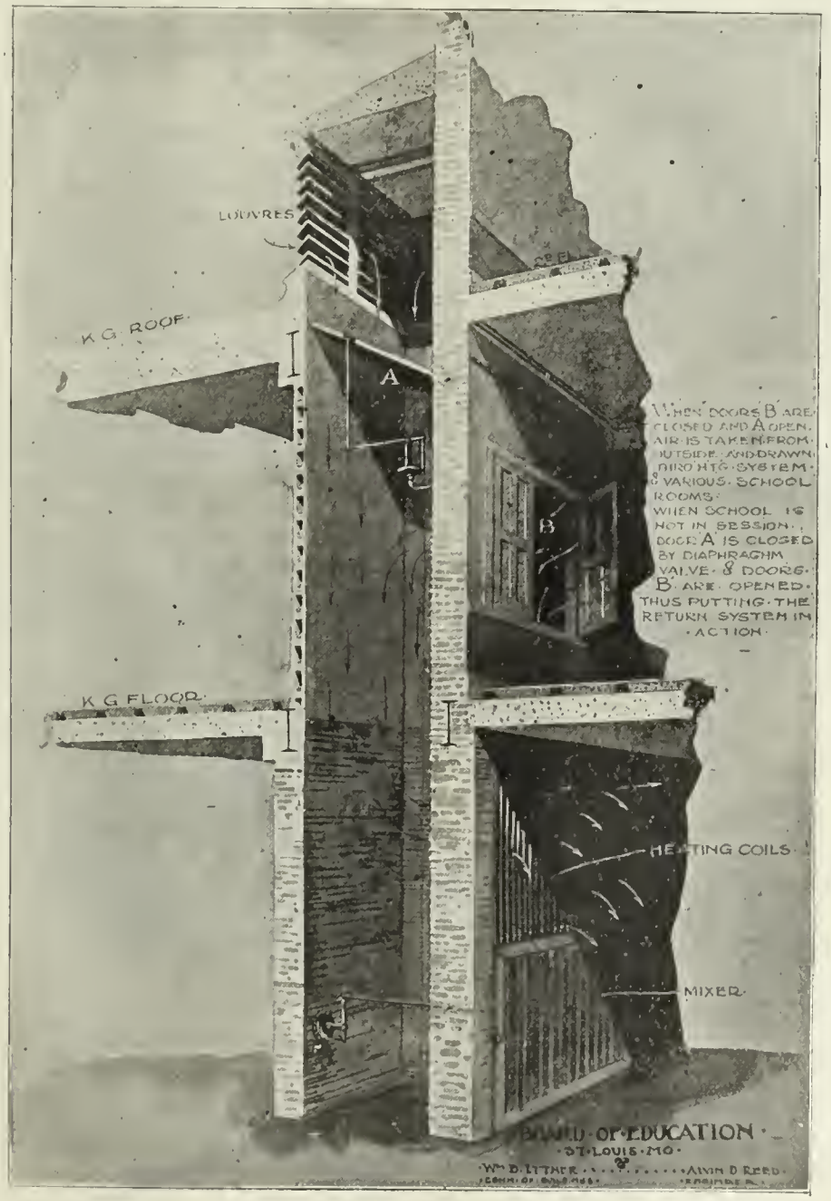

Fig. 7.—The Air Flue and Valves.

The heating of the halls and corridors, as well as the entire basement, is accomplished by hot air. No direct radiation is used.

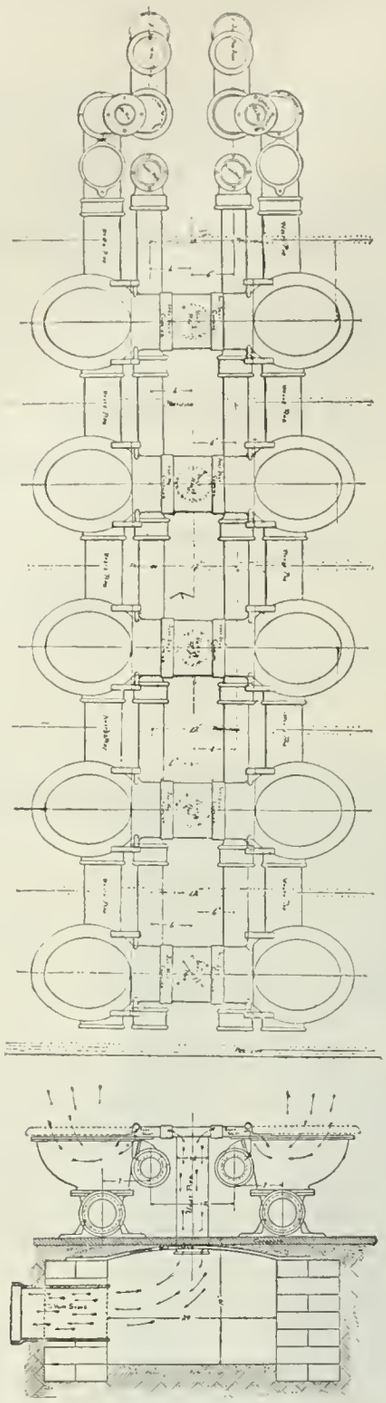

Fig. 8.—The Latrines and Sanitaries.

The sides of the fan housing, the casing of the coils, the sides of the hot air and tempered air rooms are painted and finished in white enamel, as well as the engines, pumps, &c. The pipes, when covered, are painted white. The walls and ceilings are also painted white; and all these, when finished as described, give an idea of not only a useful apparatus, but one interesting and beautiful.

The latrines and sanitaries, shown in plan and elevation in Fig. 8, are also an important part of the fitting up of a modern school house. Each of the closets shown has a local vent of 7 square inches, connected to an underground duct leading to the space around the cast iron stack. The urinal stalls, shown in Fig. 9, are also ventilated in the same manner, each stall being separately ventilated into the underground duct.

We have a special arrangement for keeping a fire in the stack in warm weather when there is no fire in the boiler, insuring perfect ventilation at all times.

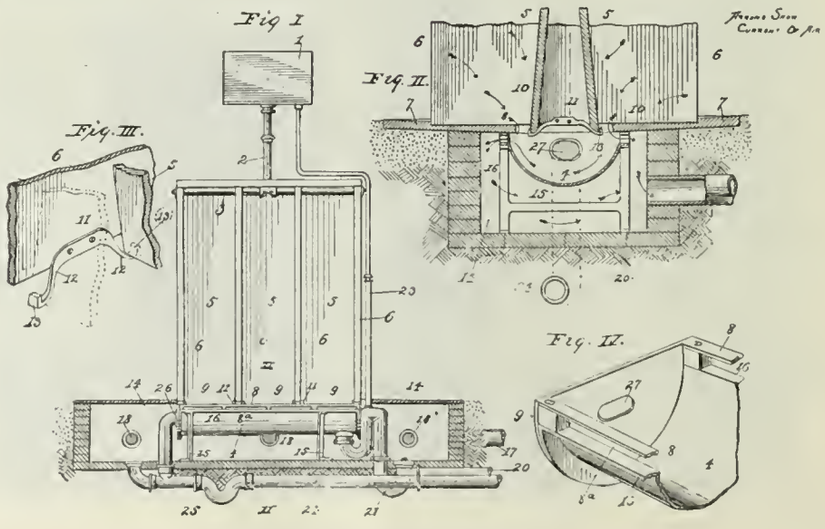
THE ANNUAL CONVENTIONS.

It seems that Atlantic City this year is to be the Mecca to which the heating and plumbing trade will make their pilgrimage. It is reported that arrangements have been completed making the Hotel Rudolph the convention headquarters, and the Auditorium on the Steel Pier the place for holding on June 17, 18 and 19 the meetings of the twentieth annual convention of the National Association of Master Plumbers.

The National Association of Master Steam and Hot Water Fitters have also selected Atlantic City as the place for their fourteenth annual convention, which will take place on June 12, 13 and 14, being Thursday, Friday and Saturday of the week preceding the plumbers' convention, which opens on Tuesday, June 17. This leaves Monday, 16, an open day, which may be utilized by the American Society of Heating and Ventilating Engineers for holding a summer meeting. This society ordinarily prefers to hold its summer meeting at a greater distance from New York, but, in view of the fact that so many interested in the heating trade will be at Atlantic City at that time it is quite possible that the Board of Governors may decide to hold a summer meeting at Atlantic City at the same time, although as yet no definite arrangements have been made.

At the last meeting of the Central Supply Association, Put In Bay, Ohio, was selected as the place for holding their meeting on June 23, but some effort is now being made to induce that association to change the place of meeting in favor of Atlantic City. This certainly would give the supply and contracting trade a capital opportunity to discuss important matters of mutual interest.

The American Radiator Company, Chicago, announce that they have arranged with the Titusville Iron Company to offer to the trade their entire output of the Acme Fire Box Boilers. The announcement is accompanied by circulars relating to Bronze Powder for radiator decoration, and to the O. S. Circuit and Distributing Fittings, with diagrams showing their use.



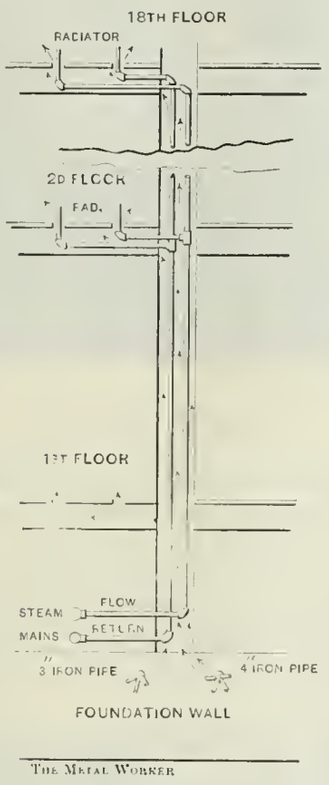


Fig. 9.—The Urinal Stalls.

BAD ODORS NOT ALWAYS SEWER GAS.

BY D. F. N.

A short time ago a complaint was received by a plumber from the superintendent of an up to date skyscraper in New York that the clerks in several of the upper offices detected an odor of sewer gas, which, after a few days, became unbearable. The building, having been finished in the summer, was equipped with modern fixtures and appliances, and the plumber who had the contract was ordered to make an investigation.

The plumber made an examination, and knowing pretty well that all the plumbing was well tested before its completion, covered the same ground as his complainants, and sure enough found that the disagreeable smell was there. In considering how best to locate this evil odor the plumber thought that it might not have its

Bad Odors Not Always Sewer Gas.

tracks well covered in the basement, and that he might be able to intercept it at that point. There, sure enough, it was found. The odor gained an entrance through the massive wall of the building line by means of an opening which held several 3 and 4 inch iron tubes, built in the wall for the purpose of carrying in the 1-inch lead covered electrical services, which were carried through the wall for use in case of emergency, the building having its own electrical plant. At the point where the tubes came through the wall he found a chase in the brick wall from the basement to the upper stories, which conducted the odor with the help of the warm air in the recess and out of the recess into the offices through the cutout for the radiator branches, as shown in the sketch herewith.

This recalls an instance of the owner of a fine dwelling sending a message to a prominent uptown plumber to appear at once to make good the inferior work he had performed. To the astonishment of his patron, the plumber unearthed a decomposed mouse from the back of the wainscoting, almost at his head when taking a bath. These incidents show the unreasonable censure which is sometimes in store even for the tradesman of long experience.

HARRY BROTHERS COMPANY, Dallas, Texas, manufacturers of Galvanized Steel Tanks, Oil, Water and Wind Mill Tanks, are building an extension, 100 x 150 feet, to their plant, and are installing additional machinery for the building of heavy Steel Tanks, Stand Pipes, &c., working iron from 3-16 to ¾ inch in thickness. All machinery has been purchased.

PLUMBERS' REGISTRATION IN ENGLAND.

BY OUR LONDON CORRESPONDENT.

The Plumbers' Registration bill has passed the House of Lords. It has still to go to the House of Commons, and I do not think there is a good chance of its becoming law. It is being actively opposed by ironmongers and heating engineers, who object to it because it throws too much power into the hands of the Worshipful Company of Plumbers, who are notoriously not friendly either to ironmongers or heating engineers, who employ plumbers. The general idea is to arrange for the registration of plumbers after examination, while the Company of Plumbers practically has within itself power to dictate upon what conditions plumbers may submit themselves for examination. Thus, if an ironmonger have a practical knowledge of plumbing, but has not served a term of apprenticeship, and the governing body decide that no plumber may go upon the register unless he has served a term of apprenticeship, the result is highly prejudicial to the ironmonger and the heating engineer. The proposed Council under the act is embodied in the third clause, as follows:

> Subject to the provisions of any scheme made under this act, the Council shall consist of 14 members, and the members shall be appointed as follows:
>
> Three by the Local Government Board.
>
> Two by the National Association of Master Plumbers of Great Britain and Ireland.
>
> Two by the United Operative Plumbers' Association of Great Britain and Ireland.
>
> Two by the County Councils' Association.
>
> Two by the Municipal Corporations' Association.
>
> One by the Royal Institute of British Architects.
>
> One by the City and Guilds of London Institute.
>
> One by the Worshipful Company of Plumbers.

It is true that power is reserved in the act for any aggrieved persons to take objection in Parliament to the scheme when finally embodied, but we know in practice that these protests amount to but little. Hardwaremen and heating engineers would not, I think, object to an impartial authority such as the Local Government Board. But the Council is overweighted with those who are friendly to the somewhat selfish schemes of the plumbers. Strong objection is also taken to the proposed measure on different grounds. It is argued that the day of registration has gone by, and that the day of inspection has come. Those who take this view contend that because a plumber is registered it is no guarantee as to his efficiency, whereas, upon the other hand, if every man who does plumbing has his work overhauled by an inspector, the test is all that may fairly be required. Another objection is that the plumbers would naturally be wedded to old methods, and would be slow to keep pace with the times. If, for example, a thoroughly competent American plumber were to settle in this country to push the plumbing trade on American lines he would have no chance. Altogether, among progressive people the Plumbers' Registration bill is regarded as sectional, privileged and retrogressive.

Sanitary Enameled Ware.

Advance sheets of Catalogue C have just been issued by the Champion Sanitary Enamel Ware Company of Blairsville, Pa., who are represented in New York City by Rollin C. Wilson, 116 Nassau street. The publication consists of 46 pages of highly finished paper, 9 x 12 inches in size, showing by means of half-tone engravings a variety of styles and sizes of the Champion porcelain enameled bathtubs, which are made with nicely turned roll rims of different widths and in five lengths, from 4 to 6 feet. Several pages are devoted to the Champion enameled iron lavatories adapted for bathrooms of private residences and the continuous type suitable for use in large toilet rooms. The last section shows a variety of styles of the Champion roll rim kitchen and pantry sinks, with high backs and corrugated drain boards. The sinks are made to be suspended from brackets or supported by means of ornamental legs. The backs are 15 inches high and contain galvanized iron air chambers, and are adapted to receive the sink bibs.

ANNUAL DINNER OF THE PLUMBING AND STEAM SUPPLY LEAGUE.

The first annual dinner of the Plumbing and Steam Supply League, given at the Drug Trade Club in New York last Saturday night, was one of the happiest incidents that has ever marked the trade. The Plumbing and Steam Supply League having completed a bowling tournament, the awarding of the prizes to the winners, whose names have already been given in *The Metal Worker*, was made the occasion for a dinner, which was attended by some 150 members of the league and prominent men in the supply trade. The success of the league and the pleasure derived from the bowling contests, capped by the delightful affair which the prize dinner proved to be, are entirely due to President E. E. Haff, who originated the idea, and to Secretary Rollin C. Wilson, who ably assisted him in anticipating and carrying to perfection every detail. As a result it has been decided to make the league a permanent fixture. The meeting at the Drug Trade Club, preceding the dinner, gave ample evidence of the cordial relations existing between the various members of the trade. At a few minutes after 7 the voice of President Haff sounded above the merry sallies that were being interchanged, inviting all to proceed to the dining room, where the following *menu* was discussed:

Menu.

●●●

FIRST FRAME
"Splits All Along The Line."
Blue Points on half shell.

SECOND FRAME
"Having The Soup Poured Into Us."
Cream of Chicken a la Reine.

"Good Eye"

NINTH FRAME
"All Down."
Coffee

TENTH FRAME
Cigars.
"Set 'Em Up On The Other Alley"

When the cigars had been lighted at the tenth frame, President Haff, in announcing that the prizes were to be presented to the winning teams and individuals, spoke feelingly of the successful outcome of the venture, due to the ever ready co-operation of every member of the league. The various speakers who had been invited to present the prizes seemed to be inspired by the occasion and the brilliancy of their witty sallies received appreciation and applause that could by no means have been drawn out by mere oratory. In connection with the speeches the referee had his eye on the foul line, and saw no breaks, for the speakers all made strikes and still had something to spare. Among the speakers were: J. H. Campbell of the Trenton Potteries Company, John A. Murray, Frank K. Chew of *The Metal Worker*, F. W. Blauvelt and George M. Fawcett of F. N. Du Bois & Co., Thomas Delaney of Coyne & Delaney, A. B. Beith of the Dimock & Fink company, Frank P. Richardson of the Colwell Lead Company, James M. Heatherton of the *Plumbers' Trade Journal*, Charles Hirschfield of Landers, Frary & Clark, John K. Allen of *Domestic Engineering*, W. S. Emery and Harry M. Smith of C. S. Locke & Smith. In presenting the second prize for individual average to Rollin C. Wilson, Mr. Blauvelt of F. N. Du Bois & Co. read the following lines, which were received with applause:

E. E. HAFF, Ex-President.

YOU COULDN'T HARDLY NOTICE IT AT ALL.

When Rolly rolled his average score,
If he had made just one spare more,
He'd won first prize and made a bigger haul,
But although the game was fair,
He just missed it by a hair,
And you couldn't hardly notice it at all.

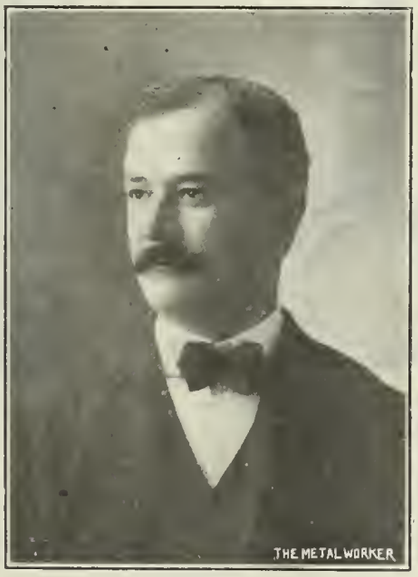
As captain of the Salesmen's team,
With honest pride his eye did gleam
Upon his bowlers, who were doomed to fall.
And when the Murray team they met,
Although they went for them, you bet,
You couldn't hardly notice it at all.

Then they rolled Du Bois & Co.,
And found their team was not so slow,
But still they thought they'd drive them to the wall.
And while they played a good, stiff game,
I have to tell you, all the same,
That you couldn't hardly notice it at all.

So to drown their woes up to the bar they flew,
And ordered several drinks from our good friend, Cadieu,
I'm told they all took a Wilson High Ball,
And when they'd drank it down
You'd thought their heads would swim around,
But you couldn't hardly notice it at all.

Now with the Salesmen's team we all do sympathize,
Because they had hard luck and didn't win a prize
To which with pride they might attention call.
But when they only sent three men,
Of course, their score was queered for them,
And you couldn't hardly notice it at all.

Two prizes were awarded in addition to those on the regular schedule. One was presented by James Conran of the Standard Mfg. Company to W. S. Reins of the Central Foundry Company, for making a strike, which was said to be the only one he made. In the absence of Mr. Reins, Vice-President C. G. Beach, also of the Central Foundry Company, agreed to accept the prize for his team mate, and to him and the audience Mr. Conran delivered a very touching oration. In reply Vice-President Beach, in behalf of Mr. Reins, accepted the beautiful leather medal presented, with remarks expressing a fitting appreciation of the honor conferred, and assuring all that it would not only be worn with pleasure by Mr. Reins, but would be handed down to his posterity.



The other prize was presented to Samuel S. Glauber

by Vice-President Beach. This prize Mr. Beach took down from the walls of the club room, where it was hung as one of the decorations. It was a handsome stein of the four-story character, and topped with a suitable metal roof. The sides seemed to be covered with ornamental steel siding and decorated with radiator bronze. After a brilliant speech commending Mr. Glauber's sportsmanship and skill, Mr. Beach invited him to

ROLLIN C. WILSON, Ex-Secretary.

come forward and receive the cup. At this point many arose and protested against the presentation, some stating that they had money on Mr. Vogel which he had won for them, and they objected to the prize being presented to the loser. Vice-President Beach explained that he did not intend to be deprived of the pleasure of presenting the prize through the absence of the vietor, and that even if Mr. Glauber was the loser he should present the prize to him as a tribute to his grit. Instructions were given to the proper authorities to prevent Mr. Glauber

MARTIN BEHRER, President.

from removing the property of the club from the building. This little episode called forth no small amount of mirth. particularly when Mr. Glauber, on being held up at the door, decided that the prize was too large to carry.

After the prizes had been presented and the speeches made, President Haff rapped for order, and said that a motion had been made that the Plumbing and Steam Supply League be continued for another year. At the suggestion of E. E. Benas of Thomas G. Knight, Brooklyn, to make it a dozen, President Haff consented. It should be recorded that Mr. Benas, by his side remarks, contributed no small share of the mirth of the evening. He spoke frequently, although his name was not among the list to address the prize winners, and his remarks were always to the point. The motion was unanimously carried. The president then announced that it was necessary to elect officers for the ensuing year, and the Wire Pulling Committee nominated the following officers:

President, Martin Behrer.
Vice-President, C. V. Driggs.
Secretary, W. G. McCormick.
Treasurer, Fred. Lowe.
Board of Managers: W. S. Gibbs, A. E. Good, J. R. Igelstrom, A. E. Beith, W. B. Ogg, Captain W. S. Emery.

The secretary was instructed to cast one ballot for the nominees, who were unanimously elected.

It was nearly 12 o'clock when the guests arose from the table, fully appreciating the theme which had been touched upon by all of the speakers, which was the value of cultivating the social side of business. Many instances were related where small annoyances and trade

W. G. McCORMICK, Secretary.

grievances had been explained at the bowling alleys, and misunderstandings had been adjusted, demonstrating that even in the pursuit of the almighty dollar the highest benefit can be derived in the relaxation that comes from cultivating the social element.

Copper Floats.

The Hercules Float Works, Springfield, Mass., issue a general catalogue and price-list, No. 2, of Hercules seamless copper floats and air chambers for all pressures. The standard weights and sizes of the copper ball floats range from 2½ inches, weighing 3 ounces, to 16 inches, weighing 39 pounds. They also make column floats for water columns, boiler feeders, to order, any diameter to 15 inches and to 22½ inches in length. Their seamless copper air chambers are guaranteed to be free from imperfections in manufacture and to have been tested to a pressure of 300 pounds per square inch, and for a working pressure of 150 pounds. All floats are also guaranteed to have been tested to 300 pounds pressure per square inch.

WILLIAM C. TUCKER, civil and sanitary engineer, 156 Fifth avenue, New York, is frequently visited by members of the plumbing supply trade and the contracting plumbers, who wish to consult him as to what is required in buildings in which he is retained by the architect to design the sanitary and drainage system. Mr. Tucker has been the sanitary engineer in charge of work in some of the largest buildings in New York City, and has also been retained to design the sewage disposal system for many large country houses isolated from sewers.

PLUMBING SUPPLY HOUSES TAKE ACTION TO STOP AN ABUSE.

The plumbers' supply houses in New York City, Brooklyn and vicinity have taken joint action for the purpose of abolishing certain abuses which have been allowed to continue in the trade for some time. One of the most flagrant and expensive impositions, from the supply house point of view, is the abuse of the returned goods privilege.

There is no trade or calling, other than that of plumbing or steam fitting, wherein the retailer is allowed to order goods indiscriminately and return them, if not wanted, at a subsequent date. In many lines of business the return of goods is reasonable, for some goods always remain in a salable condition. This is not the case, however, in the plumbing supply business, owing to the fact that the major part of the goods are highly finished and plated. Brass work, especially if it is highly finished and nickel or silver plated, when exposed to the atmosphere, and also when it is handled, becomes unsalable. Moreover, in most cases where goods are ordered in large quantities and are removed from the original packages the packages are broken or lost, and the goods when returned are found to be in an incomplete and unsalable condition.

Aside from the expense entailed in the double handling of goods, there are also involved the question of looking up back charges, the identification of goods, the bookkeeping necessary to credit customer, and the charge of the returned goods to the stock account. All this expense, or nearly all of it, can be avoided if the proper attention is given to the orders when they are originally placed.

This is true also of cast iron soil pipe and fittings, cast iron sinks, and goods of that nature. Excessive quantities of the materials are very often ordered to be sent to a building which is in course of erection, and the goods which are not used are allowed to remain in exposed places where mortar, lime and dirt of all kinds are allowed to fall upon them and make them unsalable for the jobber.

It is to curtail or prevent this abuse that the jobbing trade in this section of the country have got together. The following circular bearing on the matter was issued simultaneously by those concerns signing it:

March 15, 1902.

To the Trade:

In order to avoid all misunderstandings regarding the position of the manufacturers and jobbers of plumbers' supplies upon the question of returned goods, the undersigned respectfully notify the trade that hereafter when orders have been correctly filled, no credit will be allowed for goods returned, unless a full explanation is given to, and consent obtained from, the manufacturer or jobber, and all goods returned, if accepted, will be credited at the same prices at which they were charged, less ten (10) per cent. and all shipment and receiving expenses.

Respectfully,

Fred. Adee & Co.,
Behrer & Co.,

The Barry Mfg. Company

The pioneer plumbing house of this city and State, says the *News-Tribune* of Muscatine, Iowa, has been transferred to its new owners, the Corry & Warentine Company of Davenport, who will continue the plumbing contracting business conducted heretofore by the Barry Mfg. Company, at 409 East Second street. The Barry Mfg. Company enjoy the distinction of being the earliest plumbing contractors in Iowa, having established the business at Muscatine in 1875, since which they have been doing a continuously increasing business. They entertained no thought of disposing of their contracting branch until an offer was made to them, which now enables them to devote their attention to the large factory located at Third and Mulberry streets, where they manufacture an extensive line of plumbers' supplies.

New Walker Boiler Catalogue.

The Walker & Pratt Mfg. Company, Boston, Mass., are issuing to the trade their Catalogue No. 31, which has recently been compiled by John A. Fish, manager of the company's wholesale boiler department. This catalogue is devoted to the new Walker boiler for steam and hot water heating, which is of the vertical sectional type. The boilers are made with three different widths of grates—15, 20 and 32—of varying capacity, rated to carry from 400 to 4500 square feet of hot water radiation, and from 240 to 2700 square feet of direct steam radiation. Additional features which will be found of interest to the steam fitting trade are the width, length and hight of the boiler, the shipping weight, and other detailed information. The catalogue also shows the grate and ash pit section and the different styles of grate bars with which the boiler can be furnished. The company also manufacture steam radiators of the vertical loop pattern indirect pin radiators. The catalogue is accompanied by a long list of parties who are using the new Walker boiler with satisfactory results.

Expansion Bolts

The illustrations herewith relate to two of the later forms of expansion bolts put on the market by the Steward & Romaine Mfg. Company, 124 North Sixth

Fig. 1.—Expansion Bolt with Pipe Hanger Attachment.

Fig. 2.—Expansion Bolt with Reducing Pipe Socket.

street, Philadelphia, Pa., who manufacture an extensive line of expansion and toggle bolts for a great variety of purposes. Fig. 1 is an expansion bolt with pipe hanger attached, which is supplied to manufacturers of pipe hangers and other supporting hangers or rings, which are completed by the pipe hanger manufacturer as illustrated. Fig. 2 is another form of bolt which shows a reducing pipe socket attached in place of hanger. It will be seen that the end of the bolt opposite to the expansion end is threaded with gas pipe thread to fit into the socket. Another device of the same group not here shown is a hollow expansion bolt for electrical purposes, which permits the running of wires through the center of the bolt, the shank portion being made of tube iron, threaded to receive the expansion parts. This form is especially suitable for holding arc lights and electric fixtures, &c.

The Crane Company Buy Out the John Schram Company.

One of the pioneers in the stove, furnace and house furnishing goods business on Puget Sound was John Schram, who, as his business grew, eventually became head of the John Schram Company at Seattle, Wash. A year ago the company closed out the retail branch of their business and have since devoted themselves to jobbing plumbing and steam fitters' supplies, in addition to other lines of goods in demand in their territory. The company were recently visited by A. F. Bennett of the Crane Company of Chicago, who were looking for a suitable site and building for the establishment of a branch house. The new building and surroundings of the John Schram Company were found to be admirably adapted to their purpose, and the company proposed buying out the concern. The Crane Company were satisfied with the offer made by the John Schram Company and the sale of the entire business was effected on March 11. The Crane Company will take entire charge of the business on April 1. The company now have 22 branch houses throughout the country, and on April 1 they will have four on the Pacific Coast, at San Francisco, Portland, Los Angeles and Seattle.

Mr. Schram, who was the head of the old concern, is one of the best known men in Seattle, having established himself there 20 years ago. He was burned out in the great Seattle fire, but rebuilt his plant and eventually established a large business throughout that section. He has frequently refused political positions, but has been a very active member of the Chamber of Commerce, of which he is the second vice-president. His retirement from active business at the present time affords him an opportunity for making a long desired European trip during the coming summer.

Power for the Plumbing Inspector.

In many cities the plumbing inspector's office is under the jurisdiction of the Board of Health, and it is well known that health boards are usually equipped with wide powers. According to the *Post* of Louisville, Ky., it is proposed to give the plumbing inspector in that city the right to enter a property and go over it at will, to test all the pipes according to his own plan, and to condemn any work that seems to him inexpedient or faulty, the owner or occupant being required to make the repairs in accordance with the views of the inspector. Evidently there is some opposition to the conferring of such sweeping power on an official, as the following comments from the *Post* would indicate:

The man most apt to know about the plumbing is the head of the family, for he has most at stake. He does not wait for the inspector. He sends for his own plumber and makes what changes he deems wise.

This is the only inspection that is worth anything. Official inspection is an impertinence and is designed merely to increase the number of officers on pay and to vex and tax the householders. Plumbing is not an applied science. Certain rules are accepted, but the application varies with each establishment.

It has been a common experience, for illustration, for one plumber to condemn unreservedly the work of another in installing a natural gas outfit, remove it and put in another with exactly the same defects or shortcomings. All that remains is for the householder himself to watch results and keep the best plumber he knows at work until the defects are cured.

It is preposterous to say these things are better done by officers than citizens. There is the city itself, with its vile gutters, its uncleaned streets, its insufficient sewers; let the city alter, improve, perfect these things and we will hear little or nothing about defective plumbing.

The ordinance is mischievous and uncalled for. More men want office. Getting it, they will to justify themselves be tearing out the plumbing in hundreds of houses or ordering it out, and the end will be worse than the beginning. The householders are to be the victims of this office, and before it is too late they should enter their protests with their Aldermen and Councilmen.

In sections where the plumbing is of a primitive character more or less objection is always experienced when radical changes are necessary to make the plumbing come up to modern sanitary requirements. Seeming hardships are felt by the individual, notwithstanding that the object is for the public good and the individual is sure to enjoy the greatest benefit. The sweeping powers that the official would possess if the authority mentioned was conferred upon him differ from what is generally customary only in that the inspector would have the right to enter premises, instead of getting a permit or order in a special form from the Board of Health, which always has such a power when necessity demands its use. The assumptions in the comments quoted may seem reasonable to the layman, but to those who have made a study of house drainage systems they will seem a little weak.

New York City Notes.

Some of the jobs which have been in course of preparation are now ready for the plumbers to begin work upon them. Among them are a new apartment house at 138th street and Lenox avenue, where S. J. McCarthy is doing the plumbing. C. Muller & Son of 731 Seventh avenue have the plumbing in a new apartment hotel to be erected at the corner of Sixth avenue and Fifty-sixth street. Thos. Kirkwood of 415 Lexington avenue has three buildings on Twenty-first street, near Tenth avenue, for the General Theological Seminary of the Episcopal Church. W. G. Cornell of 54 Lexington avenue has the apartment hotel in connection with the Hotel Marie Antoinette, at the corner of Broadway and Sixty-seventh street; also the new Music Building, on the site of the old A. T. Stewart mansion, at Fifth avenue and Thirty-fourth street, and the Broadway Building, at the corner of Broadway and Maiden lane. E. B. Gordon of 61 East 126th street has the Church of St. Charles Borromeo, on 141st street, west of Seventh avenue.

* * *

George A. Pearse, Jr., of 161 West 120th street has three private houses on Seventy-seventh street, west of Central Park West, and facing the Museum of Natural History. John Toumey & Son have a row of stores that are being put up at the corner of 125th street and Seventh avenue. T. J. Byrnes will be busy for some time to come with work in the new Custom House, which occupies the block on Bowling Green and Whitehall, State and Stone streets. Kelly Brothers of 1661 Amsterdam avenue, in addition to their many other jobs, have the plumbing in the large building at Twenty-third street and Seventh avenue. J. H. Steinmetz of 145th street and Amsterdam avenue has a church building on 142d street, near Amsterdam avenue. T. J. Cummins has five high class private houses on 100th street, east of West End avenue. M. M. Golding has a business and loft building on Sixty-fifth street, west of Broadway. Geo. Dillon of 258 East Broadway has a factory building, 50 x 148 feet, at 20 and 22 Hancock street. Otto J. Schwarzler of 2800 Third avenue has an apartment house, 50 x 100 feet, on 100th street, west of Park avenue.

* * *

The plumbers who are doing business in other than their home boroughs have been put to considerable annoyance by the fact that they have to take out bonds in each borough in which they do business. Should some of the other departments with which the plumbers do business be as strict in ascertaining who the plumber is who happens to be doing the work as the various sewer departments are there would not be as many unlicensed plumbers working under other people's licenses as there are to-day. A few revocations of licenses by those who have authority would be a wholesome lesson.

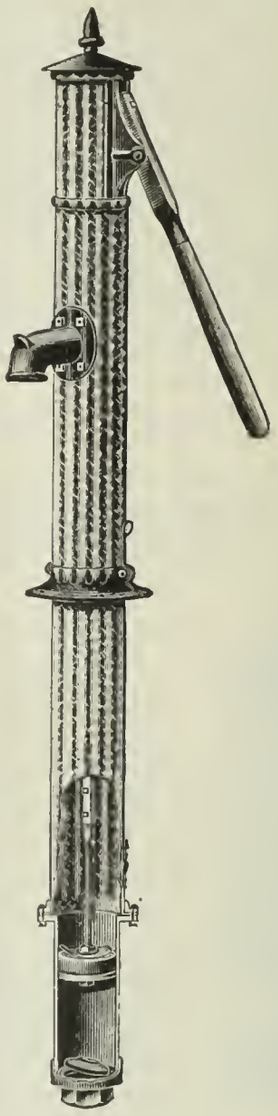
On March 10 the Novelty Iron Company, Canton, Ohio, suffered from a fire which entirely destroyed their foundry. The company are now engaged in adjusting the insurance, removing the refuse and getting ready to meet the demands for the Our Own line of Steam and Hot Water Boilers. These Boilers are being pushed in New York and vicinity by I. G. James, who has recently transferred his office to the Park Row Building, New York City.

Enameling Rough Cast Iron Bathtubs on the Outside.

"In the work in a large apartment house I am called upon to enamel a lot of cast iron, porcelain lined bathtubs on the outside. The surface is very rough, but the finish is to be as smooth as the inside. I have given two coats of cement, such as is used for iron safes, which I have rubbed down with lump pumice stone, and I am now wondering what the result will be in six months, after the hot water has been in the tubs. I think there must be a filler and surfacer for this kind of work, better and cheaper than the method I am now using, and would like to have advice on the subject."

In response to this request, made to the *Painters' Magazine*, the following is given: We think that you can procure from one or more paint manufacturers the proper kind of material required for the work in hand. You require an iron filler, such as is used on gas engines, of a color that is close to the finish you wish to apply. This filler must be of puttylike consistency, so that for very rough places you can apply it with a wide spatula, and thinning it somewhat with turps, like an iron safe plaster to less rough surface. This filler must be of such a nature that when applied heavy it will show no cracks, and yet have enough binder so that it may be rubbed with pumice. It must also sandpaper freely in from six to eight hours. When the surface is so prepared, any good grade of engine enamel will stand the action of hot water very well, because the outside of bathtub will never become as hot as the cylinder of an engine.

An Old Roman Water Official.



In his translation of the two books of the water supply of Rome, by Sextus Julius Frontinus, says *Fire and Water*, Clemens Herschel gives us a good idea of the work done by that ancient hydraulic engineer in supplying the capital of the world as known to its civilized inhabitants in the year of our Lord 97, when Nerva was at the head of the Roman Empire. The historical notice is rendered all the more interesting by the addition of the photographic reproduction of the original Latin manuscript and explanatory chapters by the editor. Frontinus was water commissioner (*cuator aquarum*), and his work shows that he, in common with other hydraulic engineers of his day, knew a great deal more about his profession than most people of to-day give him or them credit for. The ordinary hydraulic engineer of every day life may imagine it to be a comparatively modern discovery that water will "rise as high in a pipe as the source from whence it came," and that for that reason the Roman officers who had charge of the water supply went to enormous expense in building high aqueducts spanning vast valleys, and carrying the water for miles overland, when the same purpose could have been served by the use of underground pipes. But the reader of Vitruvius knows that he was acquainted with the inverted siphon, while the elder Pliny's casual remark that "water climbs to the same hight as that from which it sprang" shows that the same knowledge was common to all the scientists of his day. Had the Romans been able to secure cast iron mains like those now in use, they would never have gone to the expense and trouble of building aqueducts. But their scientific and mechanical knowledge had not attained a hight which has been reached only of comparatively late years, and even in the twentieth century is not universally made use of. The Romans, therefore, as Mr. Herschel points out, simply did "what every engineer does at the present day, using to the best advantage the materials and facilities for his work found at hand for the time being."

Mr. Herschel also gathers from his researches into the matter of distribution and supply that, instead of nine aqueducts carrying to and discharging into the city of Rome between 350,000,000 and 400,000,000 gallons a day, the supply they afforded daily was never more than 84,000,000, ordinarily only 40,000,000. As a rule the nine aqueducts were not all running at the same time, since every now and then one or more was shut off for repairs, to say nothing of the constant impudent and open thefts of water which were the rule and not the exception.

Mr. Herschel is the first to produce in complete and authentic form the Frontinus manuscript, which is one of the prized possessions of the famed Benedictine Abbey of Monte Cassino, Italy. The book is doubly interesting, both from a scientific and an historical standpoint.

Twentieth Century Pump.

The Berger Mfg. Company, Canton, Ohio, have bought out the Twentieth Century corrugated galvanized steel pump, here illustrated. The body of the pump is of corrugated form which gives greatly increased strength as well as allowing something for expansion in freezing weather. A special device enables an individual to open an outlet so that a vent is provided for all water contained in the pump as a preventive in times of low temperature. The cast iron base is adjustable, and can be set at any hight to suit the user. The cylinders are cast iron, and are referred to as simple and strong. The pump can be quickly set up, lifts the water easily, and delivers it rapidly. Especial attention is called by the manufacturers to the fine quality of material and workmanship of the pump.

Sectional View of Twentieth Century Pump.

The Home Heating Company have been given a franchise by the city of Anderson, Ind., to operate a central heating plant and lay mains in the streets. The ordinance giving the franchise stipulates that the rate of charges to customers shall be 17 cents per square foot of radiation for hot water heating and 26 cents for steam heating. The company are to pay the city 2 per cent. on their gross receipts after 1905.

Soldering Fluxes and Acids for the Apprentice.

BY HELMAR.

A boy who had worked at the business but a few weeks when asked how he was getting along rattled off the following:

"Lead tarnishes very quickly. Cleanings for wiped joints should be covered with tallow as soon as shaved. Tallow keeps the air from tarnishing the cleaned part and does not interfere with the solder sticking to the lead where it is cleaned. Lead should not be cleaned long before using or soldering it. When cleanings are to be soldered immediately, powdered rosin makes a good flux; it seems to have the power of making solder unite with lead, just as though it had been melted together in a pot instead of being melted on with an iron or by pouring. A particular feature of all soldered joints is to have the solder and the cleaning perfectly clean. No joint is safe or permanent unless both are clean. Rosin will not do for wiped joints; it 'blows,' smokes and sticks to the cloth, stiffening it and unfitting it to wipe with. Ordinary sperm candle 'tins' on lead, brass and copper; it tins under the soiling on wipe joints, too, so it is not good to cover wipe joint cleanings. Raw muriatic acid (commercial) works well on new and old galvanized iron. It must be wiped and washed off immediately after soldering or it will eat into the iron and injure the pipe. Galvanized iron boilers and pipe cannot be soldered well, and if at all, the galvanizing must be filed off so that the solder will take to the iron all around and over the leak. 'Cut' acid (muriate of zinc, made by putting in muriatic acid all the zinc it will dissolve) works well on new galvanized iron. Raw acid is often used on old galvanized iron, because it cuts the dirt off easily. Acid diluted with water is used on galvanized iron and brass, too, but 'cut' acid must be used when plain filed iron is to be tinned and soldered. Plain iron ends tinned with acid are not good for solder. Ever so little zinc affects the solder. Brass cleanings should never be tinned by dipping into wiping solder; brass contains zinc and the solder melts some of the zinc out of the brass, then the brass is not so good and the solder is ruined for wiping purposes. A face put on a soldering copper by rubbing it in rosin on a brick, after filing, will stay longer than one put on with acid or sal ammoniae."

The boy says "The man I work with told me this every day until I could remember every word or any part of it, and said that such knowledge would get handier every day, and that if there was anything wrong in it I would find it out soon enough."

The Brass Crafters.

The above title adorns the first cover of a 48-page catalogue issued by the Colwell Lead Company, 51-65 Centre street, New York, devoted to bathroom and lavatory accessories. On the front cover of the catalogue is shown in colors a scene in a brass foundry at pouring off time. The back cover shows a fine bathroom fully equipped with the product of the brass crafters. The catalogue is profusely illustrated with half-tone engravings displaying a variety of soap dishes, adapted for attachment to side walls or to marble slabs and to hanging on the edge of the bathtub. These are followed by a variety of sponge holders and combination soap and sponge holders. Another section contains some very ornamental towel holders, some being made in connection with tumbler holders. A handsomely nickel plated towel basket is another one of the bathroom accessories. Bathtub seats occupy two pages, and the last portion of the book is occupied by tumbler holders, tooth brush holders, comb and brush holders and racks in a variety of ornamental styles, some shown with a soap cup attached. Glass shelves, clothing racks and beveled plate glass mirrors with nickel plated frames occupy another section. A variety of ornamental toilet paper holders completes the catalogue.

W. J. Hyland has purchased the property at the corner of Dwight street and Harrison avenue, Springfield, Mass., on which he will erect a one-story brick structure for his plumbing business.

Heating and Plumbing Notes.

A master plumber of Paterson, N. J., writes in the Paterson *Press* an open letter to the master plumbers of that city calling attention to the fact that while the city had passed through a fire and a flood without assistance the plumbers are now menaced by an influx of out of town plumbers, who desire to participate in the benefits to be derived from work on the new buildings to be erected. The Paterson master plumber evidently entertains the idea that the plumbers in that city are entitled to the work, and that inasmuch as the city has not asked for assistance from outside the profits that are to be derived from the rebuilding of the burned and damaged portions of the city should be enjoyed only by its citizens. He calls attention to the fact that for some time there has been no master plumbers' association in Paterson, and deplores the fact that there is now no organized body to protect the interests of the plumber.

Clifford Schlemmer, representing Oliver Schlemmer of Cincinnati, Ohio, has been spending a few weeks in New York visiting the trade in the interests of the O. S. Distributing Fitting and the Temple Vent Fittings for steam fitters' and plumbers' use.

The Jarecki Mfg. Company, Erie, Pa., have booked some large orders for Brass Goods for the London market.

The Standard Sanitary Mfg. Company of Pittsburgh are reported to have received a substantial contract for Bathtubs and other Enameled Sanitary Ware from a firm in Frankfort, Germany, for shipment to St. Petersburg, Russia.

There is a movement on at Birmingham, Ala., to erect there a $100,000 Sewer Pipe plant. S. L. Russell will be general manager of the company. Orders for the necessary machinery have been placed in Cincinnati.

An acetylene gas plant will be established at Berryville, Va., by Herbert B. Warde.

The Handbury Heater Company are moving their manufacturing plant from Pekin to Peoria, Ill.

The New York office of the Gurney Heater Mfg. Company of Boston, Mass., has recently been furnished with new attractions. Those who visit 111 Fifth avenue will find the floor newly carpeted and samples of the 1100 Series Vertical Sectional Bright Idea Boilers, beside the 404 Boilers, 445 Steam and Doric Steam and Hot Water Boilers. The Radiators made by the company are also attractively displayed so that the heating contractor can find goods adapted for any requirements. The house report an increasing business with their large sized heavy duty Boilers.

W. H. Switzer of the Utica Heater Company, Utica, N. Y., informs us that he is experiencing a fine demand on the Pacific Coast for Superior Hot Air Furnaces, Utica Heaters and the Imperial Steam and Hot Water Boilers.

Morgan & Co. of San Francisco, Cal., bid $1184 and secured the contract for the heating apparatus for the new public library at Riverside, Cal.

Roche & McGuire, New London, Conn., have the contract for plumbing the Gorton Block, in that city.

H. T. Gates, New York representative of the Prizer-Painter Stove & Heater Company of Reading, Pa., at 160 Fifth avenue, has a fine office and showroom, where he is prepared to acquaint the heating trade with the merits of the Henderson Thermo line of Steam and Hot Water Heaters made by the company.

George M. Couch, Hartford, Conn., has installed a Thatcher Furnace for heating the house of E. G. Mills, Farmington, Conn.

The Crane Company, Chicago, have just issued a special supplementary catalogue of extra heavy Valves and Fittings for 250 pounds working pressure. This catalogue comprises 96 pages, and treats of Straightway, Globe, Angle, Cross, Swing Check, Foot and Blow Off Valves, Expansion Joints, Malleable Elbows and Tees, Flanged Fittings, Pipe Bands, Flanged Tees and Crosses, &c., which are designed and manufactured for high pressure. The catalogue gives a great deal of valuable in-

formation relative to the different styles of Valves and Fittings, together with tables of dimensions, which will be found very desirable for the use of engineers and others in laying out their work intelligently to avoid delays by correspondence. The company will issue their regular standard catalogue about April 15.

St. Joseph Pump & Mfg. Company, St. Joseph, Mo., are sending out circulars describing the Perfection Water Elevator and Purifying Pump designed for well and cistern. Many features of superiority are claimed for this Pump. Galvanized steel tubing is used. It is light, can easily be lifted out of the well to repair chain, and is stiff and neat. It may be used with either iron or rubber buckets. The large reservoir at the top is referred to as preventing the water from wasting. The bucket used in the Pump is made of a single piece, open hearth steel, double lapped seams, no solder being used. The sprocket chain is another feature specially mentioned.

The recently incorporated American Gas Generating Burner Company, Bowling Green Building, New York City, have completed their organization by the election of George A. Conner, James R. Milliken, William Sutphin, E. J. Morgan and G. N. Goddoine as directors. At a meeting of the Board of Directors George A. Conner was chosen president, William Sutphin secretary and James R. Milliken treasurer. The company have acquired the patents of Mr. Dinsmore, and samples of the proposed manufactures of the company will be placed on exhibition at the office within a few days.

William O'Brien, Red Bank, N. J., has a contract, amounting in value to $1450, for plumbing and installing a hot air heating system in the residence that is being erected in that city for Robert H. McCarter of Newark, N. J. He has also the contract for plumbing a new $65,000 house which is being built at Lakewood, N. J., by H. B. Claflin. This house is to contain nine bathrooms.

Stewart Brothers, Skowhegan, Maine, are to move their plumbing business into one of the new stores in the Merrill Block, now being completed.

James Openshaw, a prominent business man and plumber of Newport, R. I., died at his residence in that city on March 24. He was a member of a number of secret societies and was particularly prominent in his connection with the Odd Fellows.

The American Radiator Company of Chicago are to build a warehouse, 125 x 300 feet, at Nashua, N. H.

The Buckeye Steam Fitting Company have moved to 3-9 Court place, Cleveland, Ohio, and are installing a complete equipment of improved pipe cutting and threading machinery.

James Laraway, Winchester, Mass., is building a new plumbing shop, 50 x 20 feet, which he expects to have ready for occupancy in April.

John Mulrein, formerly engaged in the plumbing business with his brother James on Market street, Poughkeepsie, N. Y., died at his home in Westchester, N. Y., on March 17.

W. Boyd Bratton, Lewiston, Pa., has purchased property on Valley street on which he proposes to erect a three-story brick building for his plumbing business.

An interesting question has been raised in New Britain, Conn., concerning a city ordinance governing plumbing work, and a complaint has been made that the plumbing in one of the new factory buildings has not been properly arranged. The counter argument is made that a factory does not come under the head of a habitation, as mentioned in the ordinance.

The Smart Heating Company of Fulton, Ky., have decided to move their manufacturing plant to Memphis, Tenn.

C. H. Kramer, Allentown, Pa., will move his plumbing business to a new establishment at 34 North Seventh street.

Frederick W. Herrick has been appointed an inspector of plumbing at Boston, Mass., and Frank A. Ingersoll a deputy inspector.

The B. R. Electric Company have been incorporated at Atlanta, Ga., with a capital stock of $5000, which they are authorized to increase to $100,000, to deal in Electrical and Heating Apparatus. The company will probably erect a plant for the manufacture of such goods. G. W. Brine, J. C. Rossman, J. N. Eley and others are the incorporators.

New Firms and Changes.

N. G. Coates & Son are a new firm in the plumbing business, at Findlay, Ohio, Everett Coates having been taken into the firm by his father.

W. P. Hutchinson has purchased a plumbing establishment in Stoughton, Mass.

James M. Campbell has opened a plumbing shop at 419½ Washington avenue, Colorado City, Col.

The Rankin Acetylene Company have been incorporated at Rankin, Ill., with a capital of $2500 by B. R. Cole, J. W. Bond and W. J. Irwin to manufacture Acetylene Lighting Apparatus.

The Thomas Conlin Plumbing & Heating Company of Chicago, Ill., have decreased their capital from $30,000 to $10,000.

Daniel S. Lowe bas opened a plumbing shop at 1333½ Fulton street, Harrisburg, Pa., where he will make a specialty of roofing, tinsmithing and furnace work.

George F. Leahey has purchased the plumbing business of F. H. Paquette & Co., at St. Albans, Vt.

Alderman Thomas F. Nolan, Albany, N. Y., who is an expert in the plumbing and roofing business, has opened an office at 58 Madison avenue in that city.

The James A. Trane Plumbing Company have been incorporated at La Crosse, Wis., with a capital stock of $30,000, by James A. Trane, H. A. Trauche and A. G. Jamesson.

The King Water Heater Company of Wooster, Ohio, have been incorporated with a capital of $50,000.

Charles Beiter has opened a plumbing shop at 225 Washington street, Newport, R. I.

The American Warming & Ventilating Company, Pittsburgh, Pa., have been incorporated, with a capital of $25,000, by Henry L. Williams, Pittsburgh agent of the Wills Warming & Ventilating Company; Joseph E. McGinness of McGinness, Smith & Co.; William W. Dobbins, engineer of the Wills Company; Samuel Garrison and Daniel Ashworth, a well-known mechanical engineer. The company will absorb the Pennsylvania, Ohio and West Virginia territory of the Wills Company, who have many contracts for heating and ventilating school houses and large buildings. A plant will be built at Pittsburgh in the near future.

W. A. Schell of Norwood, Mass., has opened a branch to his plumbing business at Mansfield.

The E. B. Cook Company of Buffalo, N. Y., have been incorporated, with a capital of $25,000, by E. B. Cook, W. M. Moffett and G. F. Smith, to conduct a general plumbing business.

The O. D. Mfg. Company have been incorporated at Syracuse, N. Y., by W. R. Smith, I. A. Weston, Edith P. Smith and Eva M. Weston, with a capital of $20,000, to manufacture Plumbers' Specialties.

The Cline Steam Boiler & Water Heater Company have been incorporated at Brookings, S. D., with a capital of $100,000, by David C. Cline, G. F. MacRae and T. P. Estes.

Patrick Meagher has leased a basement in the Post Office Block at Sanford, Maine, where he will open a plumbing shop.

The Coleman Mfg. Company of New York have been incorporated by W. P. Homans, W. E. Coleman and G. R. Coleman, with a capital of $5000, to manufacture Metal Fans.

C. M. Schwab, president of the United States Steel Corporation, expects to be in Homestead in June, when the C. M. Schwab Manual Training School will be dedicated. Mr. Schwab is defraying the cost for the buildings, and will have a number of guests with him in June for the dedication exercises.

Handsome Metal Ceilings and Side Walls.

The Wheeling Corrugating Company, Wheeling, W. Va., with branch offices in New York, Chicago, St. Louis, Philadelphia and Chattanooga, have issued an attractive catalogue of their productions in the line of sheet metal ceilings, side walls, &c., consisting of a 124-page book, 12 x 10 inches in size, profusely illustrated with half-tone engravings, showing a portion of their long line of stamped sheet metal suitable for ceilings, side walls, cornices, &c. In the introduction the company state that they are continually adding to their already large variety of designs, and that therefore the present publication is designed more to suggest the various styles of their products than to represent the complete line. The first 12 ceilings and side walls, and suggestions as to the selection of designs in order to secure artistic effects. Full directions for applying the metal ceilings, &c., are also contained in the catalogue.

Fig. 1.—Frieze.

Fig. 2.—Ceiling Panel.

Handsome Stamped Metal Ceilings and Side Walls.

pages of the catalogue are devoted to examples of the new Greek pattern stamped work introduced by the concern for the first time this season. The accompanying illustrations show some examples of the handsome designs offered in this line, Fig. 1 representing a Greek pattern frieze, Fig. 2 a ceiling panel, Fig. 3 a cornice complete and Fig. 4 a mold. The combinations produced by these designs are extremely artistic and effective. They are followed by similar goods in Gothic, Oriental, Rococo, Colonial and modern designs, each comprising an extensive variety of patterns of ceilings, wall plates, center pieces, borders, molds, cornices, friezes, beam faces and all kinds of sheet metal goods for interior decoration. The company announce that working plans showing the arrangement of material shipped are furnished in all cases where diagrams of the rooms to be ceiled are given to them. Detailed drawings showing the method of application are also provided. The catalogue contains information in regard to ordering steel

Discovery of Tin in Alaska.

A material reported by the State Mining Bureau of California, supposed to be tungstate of iron, has proved to be limonite. The material, says the *Engineering and Mining Journal*, was found in the sluices where they had been washing out stream tin. While reticent about the exact locality, they stated it was in Northwest Alaska, somewhere on the Seward Peninsula, on which Nome is situated. It was found over a somewhat extensive area where the men were working certain creeks for gold. When they got any gold they found little or no tin, but on four different creeks they found so much tin that according to their representation each man washed out about 1000 pounds per day. The specimens taken to the Mining Bureau were undoubtedly pieces of stream tin, in the opinion of the chemist of that institution. Should the information as to extent and amount prove authentic, other prospectors in Northwest Alaska will doubtless search for tin hereafter as well as gold. There seems to be little doubt that tin does exist there; but the extent of the deposit is still, of course, entirely uncertain.

Pattern for a Spout Hopper.

A correspondent in Minneapolis, Minn., writes that seeing our advertisement of "The New Metal Worker Pattern Book," he would like to ask whether there is any material difference between it and the one issued in 1892. He would also like to know if it contains a pattern for what he calls a "diamond head," and how to cut such a pattern correctly, sending sketch of the same. It is a short hopper with a rectangular opening at the top horizontally placed, while the lower opening is so placed that the body of the hopper runs obliquely in plan with reference to the sides and the ends of the rectangle and connects with a round pipe below.

Problems of this nature must be solved by triangulation, a subject which is but sparingly treated in the former pattern book. Our new work devotes a separate chapter to the explanation of the principles of triangulation and gives solutions to 55 problems of that class, in several of which (notably problems 176, 180 and 182) the principles involved in the above described form are explained. While our correspondent's sketches are not drawn with sufficient care to justify us in reproducing them in *fac-simile*, he has left no doubt as to the nature of the form they represent. Such pieces in the new work are termed transition pieces because, being usually made to form an intermediate joint or section between two pipes of different plans or profiles, they form a transition from one form to the other, and the principles involved in obtaining the pattern of any such piece are applicable to any other of that class.

If in making the joint at the bottom the vertical pipe is cut off square the lower base of the transition piece will, of course, be a simple circle, but if it is cut off by an oblique plane, making the angle with the inclined and with the vertical portions approximately equal, as in an ordinary elbow, then a little more preliminary work will have to be done before the work of triangulation can be begun. In that case the ellipse produced by cutting the round pipe obliquely will have to be first developed.

In Fig. 1 of the diagrams A B C D represents a plan of the upper rectangular end of the hopper, while F G H J shows the relative position of the vertical pipe with which its lower end is to miter. The proper way to obtain the correct angle of the miter between the hopper and the vertical pipe is to first construct an oblique elevation on a plane parallel to a line joining the centers of the two ends or bases in plan. Therefore, find the center of A B C D, as shown at K, and draw a line from K through the center of the round pipe shown heavy on the plan. Now, at any convenient position below the plan draw a

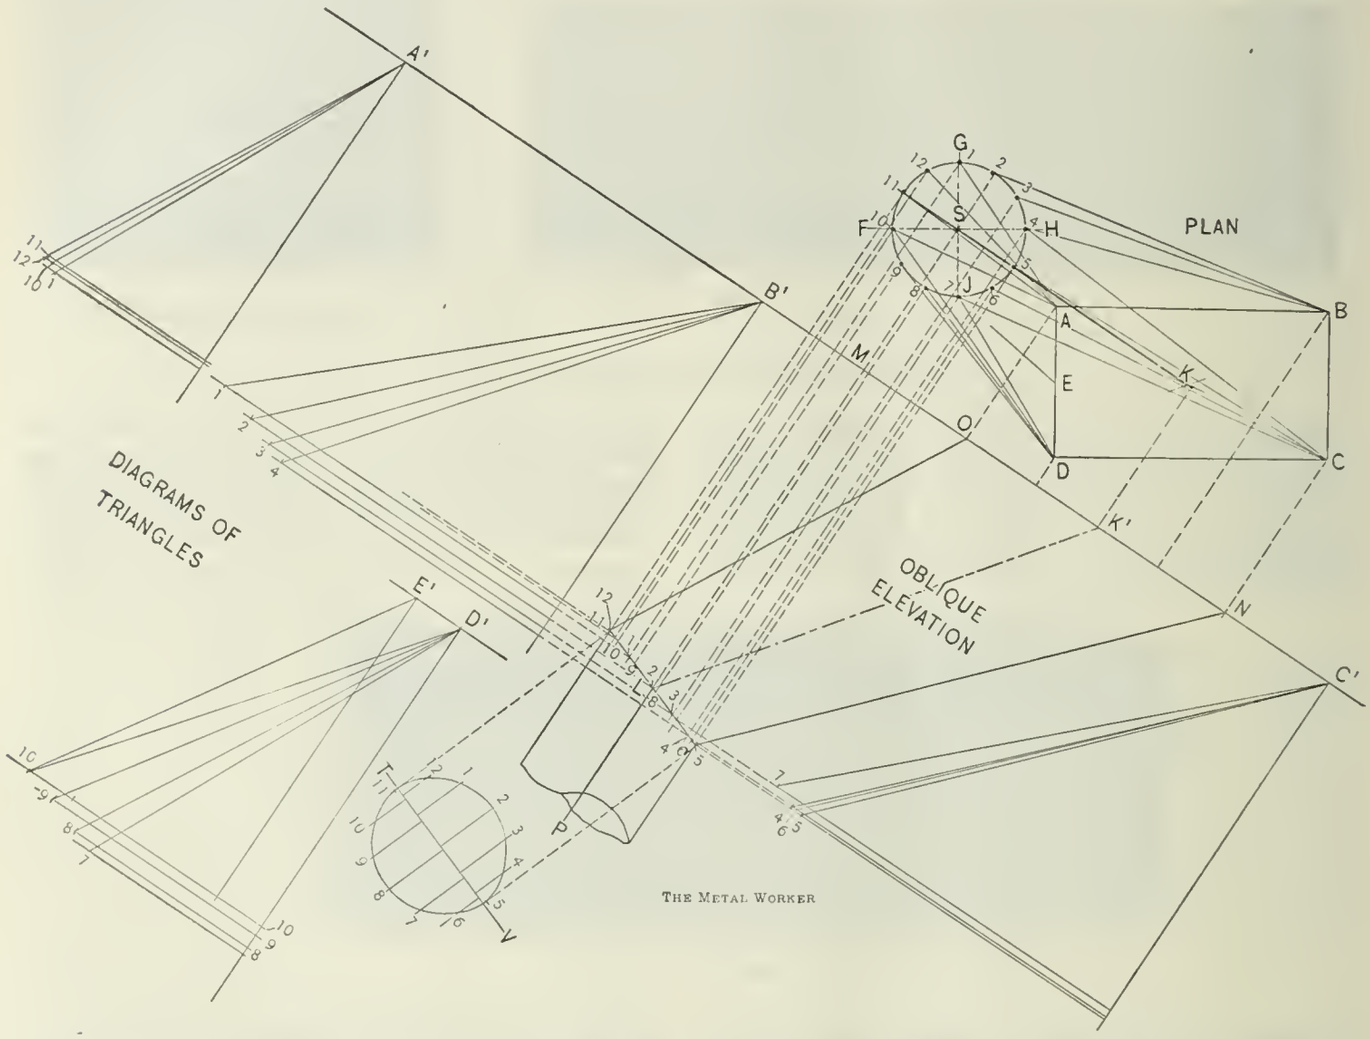

Fig. 1.—Plan of Hopper Shown in Our Correspondent's Diagrams, Indicating the Manner in which the Oblique Elevation and Diagrams of Triangles are Obtained.

PATTERN FOR A SPOUT HOPPER.

line, as M N, parallel to the heavy line, and from each of the points A, B, C, D and K drop lines at right angles to M N, cutting the same, as shown. Also drop a similar line from the center of the round pipe of indefinite length, upon which set off from M N the required vertical hight of the hopper, as shown by M L, and draw L K¹. The angle K¹ L P will then be the correct angle between the vertical pipe and the hopper, and the miter line may now be drawn through L, so as to bisect this angle, just as though both arms of the miter were to be of the same profile. The lines of the sides of the pipe may now be projected from the plan, as shown, and from their intersections with the miter line lines are drawn to the points O and N, corresponding to the angles A and C of the rectangle. This completes the general outlines of the elevation.

In completing the plan and determining the method of triangulation the plan of the round pipe must first be divided into quarters by the lines F H and G J, each quarter of which will form the base of a quarter cone

whose apex is at the corresponding corner of the rectangle. Thus F G S is the base of one-quarter of an oblique or scalene cone, whose apex is at A, while G H S is a quarter of a different scalene cone, having its apex at B. In like manner J S H C and F S J D are the two remaining cones, each of the four differing from the others in the amount of its obliquity or slant. Between the envelopes or outer coverings of these four quarter cones four plane triangles exist whose bases are the four sides of the rectangular base and whose vertices are at the points G, H, J and F; as A G B, B H C, &c. The triangles which form the sides of the transition piece may be said to be inverted with reference to the cones, whose envelopes form the angles or rounded corners of the same.

Now divide each quarter of the plan of the round pipe into any convenient number of equal spaces, as shown by the small figures, and draw lines from the points of division in each quarter to the corresponding apex, as shown. These lines represent in plan the division of each conical surface into three plane triangles, and the true lengths of these lines may be obtained by using them as the base of a series of right angled triangles, whose hypotenuses when found will be the true

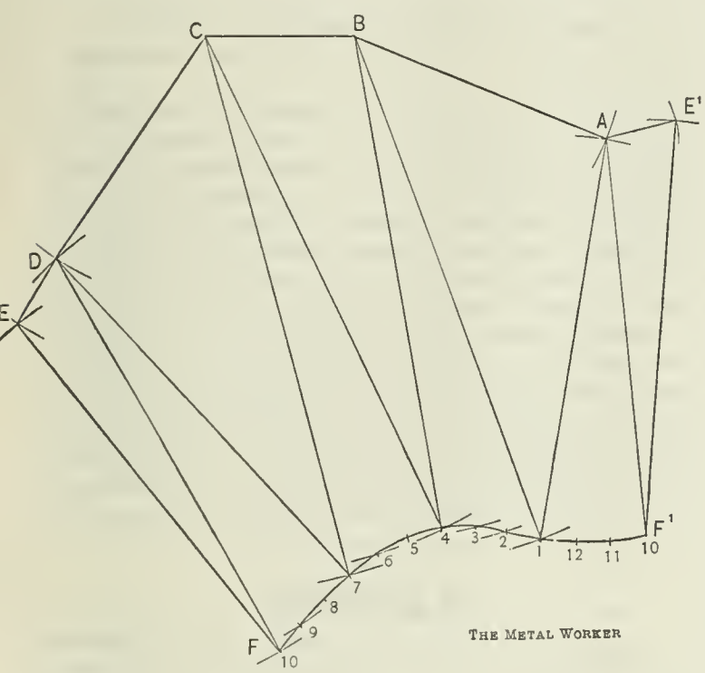

Fig. 2.—Pattern of Hopper Obtained from Fig. 1.

PATTERN FOR A SPOUT HOPPER.

distances as measured between corresponding points of the finished article. These triangles may be most easily constructed by projecting the hights from the oblique elevation, as shown at each side of the same, one group being made for each of the four cones to avoid confusion of lines. First drop lines from all of the points of division in F G H J parallel to M L, cutting the miter line drawn through L, and from the points on the miter line thus obtained draw horizontal lines (parallel to M N) indefinitely to each of the diagrams, as shown. From any points, as A^1, B^1, &c., on M N extended, draw perpendiculars, as shown, cutting the horizontal lines just drawn, and from their intersections with the perpendiculars set off on each the length of corresponding line of the plan. Thus, upon the lines drawn from points 1, 2, 3 and 4 on the miter line set off on each from the perpendicular B^1 the lengths 1 B, 2 B, &c., of the plan, as shown in the diagram, and finally draw 1 B^1, 2 B^1, &c., which distances will be the true distances across the pattern.

Had the vertical pipe been cut off square at L instead of obliquely the lengths of the several lines of the plan would have been set off from their respective perpendiculars upon a single line drawn through L, forming the bases of the several diagrams of triangles, and the hypotenuses drawn as before. In that case also the measurements for the lower edge of the pattern could have been taken directly from the spaces on plan F G H J. But since the oblique section necessarily has a longer perimeter than a right section, a true section on the miter line through L must be obtained.

To develop the section on the miter line first draw any line, as T V, parallel thereto, and from the several points on the miter line drop lines at right angles to T V, cutting the same, and extend them to one side or the other of T V to correspond with the lines of the plan F G H J with reference to the heavy center line. The lengths of the several lines are then made equal to corresponding lines of the plan, when a line traced through the several points thus obtained will give the required section.

To develop the pattern it is simply necessary to combine the dimensions now obtained, those of the elliptical section forming one side of the pattern and those of the plan of the rectangular base forming the other, while the distances across the pattern are taken from the diagrams of triangles. This part of the work will be very briefly described, because many patterns of this class have been given in our columns, and all patterns obtained by triangulation are developed in the same general manner after the preliminary dimensions have been obtained. The pattern may be begun with either of the large intermediate triangles, as that shown by B H C of the plan. First draw C B of the pattern, equal to C B of the plan; then with C^1 4 of the diagram of triangles as radius and C of the pattern as center describe a small arc, which intersect with another arc drawn from B of the pattern as center with a radius equal to B^1 4 of the diagrams, thus locating the point 4 of the pattern. The three adjacent triangles on either side of C B 4 have their apexes at C and B of the pattern. Therefore, from C of the pattern as center describe three arcs whose radii are respectively C^1 5, C^1 6 and C^1 7 of the diagrams. Now from 4 of the pattern as center describe a small arc with a radius equal to 4 5 of the section T V, cutting arc 5, and from the point 5 thus obtained in the pattern describe a small arc with a radius equal to 5 6 of the section T V, cutting arc 6, and establishing the point 6 of the pattern. In the same manner the point 7 of this group is obtained and also 3, 2 and 1 of the group on the other side of C B 4, whose distances from B of the pattern are equal to B^1 3, B^1 2 and B^1 1 of the diagrams. The large intermediate triangles corresponding to the sides C D and B A of the plan are next constructed in the same manner as C B 4, after which the two conical surfaces whose centers are at D and A of the pattern are described in the same manner as those centering at C and B, and the pattern is completed by the addition on either side of one-half of the triangle corresponding to A F B of the plan, the joint being made on the line E F.

THE AMERICAN SHEET STEEL COMPANY WAGE AGREEMENT.

The wage agreement recently made between the officials of the Amalgamated Association and the American Sheet Steel Company is as follows: This agreement, made this 15th day of March, 1902, by and between the American Sheet Steel Company and the Amalgamated Association of Iron, Steel and Tin Workers, witnesseth: That from this date until July 1, 1903, there shall be no change in the present scale of wages, and there shall be no cessation of work by the members of the Amalgamated Association of Iron, Steel and Tin Workers, and there shall be no conferences held at the request of either party; and it is further agreed that clause 3, page 26, and clause 15, page 30, of the present scale be discussed and arranged in conference at an early date.

THE LA BELLE IRON WORKS, Steubenville, Ohio, will shortly make a large increase in their capital stock. This concern have nearly completed the building of a large Open Hearth Steel plant, and have put in operation their Pipe mill for making Lap and Butt Weld Pipe. This concern will furnish Open Hearth Steel to the Pope Tin Plate Company, who are building a 12-mill Tin Plate plant at Steubenville.

The Wheeling Corrugating, Roofing & Cornice Company.

The new plant of the Wheeling Corrugating, Roofing & Cornice Company, Incorporated, at New Martinsville, W. Va., is being pushed with all possible speed. When completed it will be one of the finest and most modern plants of its kind in the country. The conductor pipe department will have a capacity of 200,000 feet per day of round, square, octagon, triangular or twisted pipe. A feature of this pipe will be a patent joint which holds the lengths of pipe securely together. The eave trough made at the plant will be manufactured by a patented process, whereby the trough is made free of twist and perfectly straight. Another feature of the company's product is a patented lap and slip joint, which makes the joints air tight without the use of solder. The capacity of this plant will be 300,000 feet per day.

The corrugating department of the company's plant is being erected from special plans and drawings. The equipment for this department will be the heaviest ever made, having a capacity of corrugating No. 10 gauge plates or a whole bundle of No. 28 gauge at one pass through the machine. Continuous tin roofing will also be made by improved machinery, with the aid of which the sheets are folded, the seams locked and soldered and the sheets painted automatically. By this method, it is claimed, the seams will be at right angles to the sides, so that when a roll is straightened out it will be found to be absolutely straight. The galvanizing plant will be equipped with all the latest improvements used in this country and Europe. The tinning plant will also be of the latest type and will embody a new departure in this line, the sheets being delivered to the sorter automatically after they leave the dipper. By a special process they will be made in exact size. The ends and sides will be at perfect right angles to each other, the waste being trimmed before tinning. There will be no uncoated edges to get rusty, and the plates will also be cleaned by a new process which leaves them entirely free from grease.

The whole plant is arranged to run without overhead belts, thus allowing a clear space for the cranes. The power plant is so arranged that each department or set of machines can be worked independently of the others. The shipping facilities are also up to date, there being 15,000 feet of covered railroad siding, so that no matter how inclement the weather may be the work of shipping will not be affected. In the plan of the works the convenience of the workmen is not forgotten. Washrooms, lavatories, reading and dining rooms are provided for the employees.

The office of the Wheeling Corrugating, Roofing & Cornice Company is located in Wheeling, W. Va., and the officers of the concern are A. A. Horscher, presiden; A. J. Wagener, vice-president; T. G. Cupp, manager, and G. C. Jansen, secretary and treasurer.

Willful Ignorance.

Since the establishment of the American tin plate industry some ten years ago a number of extraordinary statements have been circulated, mainly for campaign purposes, in regard to tin plates, which displayed either crass ignorance of the subject or a set purpose of deceiving those to whom they were addressed. One of the most delicious instances of this kind of "news" that has come under our notice is the following paragraph printed the other day in the *Labor Standard* of Paterson, N. J.:

The tin plate trust is one of the newest infant industries, protected from all competition from abroad, and has a monopoly at home. This baby trust managed to squeeze from the American people last year about $40,000,000 of profits, and this was accomplished by selling sheet iron covered with a composition of lead, which the trust calls tin. Have you noticed since the trust was formed that there is very little real tin on the market?

It is scarcely necessary to inform our readers that such a thing as adulteration of tin plates by lead is absolutely unknown in this country. It is possible that the writer of this brilliant paragraph may have stumbled across some sheets of roofing tin, known as terne plates, which he has mistaken for tin plates.

The British Tin Plate Trade.

Our London correspondent writes under date of March 15 as follows:

Buyers in the tin plate market, especially for export, are now working upon the assumption that before many weeks go by there will be a marked decline in the price of tin plates. The quantity required for South African account will be relatively inconsiderable. The present price is high, but it is argued that several causes operate conjointly or separately to weaken the market. There is no common action, and the withdrawal of orders for the time being may ultimately strengthen the market if makers are able to exercise the requisite patience. But experience has shown that the tin plate manufacturers have not the patience, or, to put it in another way, are much too deeply involved in contracts with the merchants, to wait. One of the difficulties, I might almost say diseases, of the British tin plate trade is the fact that so many of the manufacturers are under the thumb of the jobbers.

Galvanized Roofing for South Africa.

Our London correspondent, writing under recent date, says:

I would like to draw the attention of American exporters to the prospects of galvanized roofing in the near future. Over here it is recognized that prices must stiffen considerably. The war, of course, retards the movement, but it is recognized that South African buyers will before long require many thousand tons monthly for several months after the actual cessation of hostilities, and it is agreed that at the present moment there is not a month's supply at the coast ports. Against this, however, must be set a slight weakening of the market in Australia, but immediately hostilities show signs of coming to a conclusion there will undoubtedly be an abnormal demand for galvanized roofing. Prices will be high, and as shipment from New York or Philadelphia is cheaper than from Southampton, it may well be that with galvanized goods America might make heavy inroads upon the South African market.

FLASHINGS.

The recent reports to the effect that negotiations were under way for the absorption of the American Can Company by the United States Steel Corporation are announced to have been without foundation, at least in the form in which they were circulated. It is fully expected that the Steel Corporation will at some future date take over the Can Company, as the interests of the two corporations are so closely allied, but it is definitely stated that no steps to that end have yet been taken. The annual report of the American Can Company, which will be presented next month, the company having completed their first year on March 31, is awaited with considerable interest. It is said that any action by the United States Steel Corporation is likely to be contingent upon the showing made by the Can Company.

The Eastern Expanded Metal Company, 42 Court street, Boston, Mass., have the contract for constructing a power house and a casting shop for the Winchester Repeating Arms Company at New Haven, Conn.—one 34 x 60 feet and the other 54 x 89 feet, both one story high. The system of construction provides for a steel frame covered with Metal Lathing, which in turn is covered with concrete, which does away with the brick and timber and makes a very durable and substantial structure.

W. F. Bonnell of Otis Bonnell & Co. has been sent to Europe as a special commissioner for the Independent Sheet Steel Manufacturers' Association, to negotiate for the purchase of foreign made Steel Billets. It is said that orders for about 40,000 tons will be placed with English and German manufacturers.

The Toledo Machine & Tool Company, Toledo, Ohio, report an increasing demand for Dies, Punch Presses

and other Sheet Metal Machinery. Although the company have made large additions to their equipment during the past three years they are unable to keep pace with their orders and have recently added six large lathes, a heavy combined vertical and horizontal milling machine and a large Beaman & Smith horizontal milling and boring machine.

The Missouri Sheet Iron Works Company of St. Louis, Mo., have been incorporated with $20,000 capital to operate a stamping plant. E. N. Tolkacz, M. Tolkacz and M. Thiet are the incorporators.

Work is being rapidly pushed forward on the new plant of the Griffiths Charcoal Iron Mills, at Washington, Pa., and it is expected that the plant will be completed by July 1. The knobbling and charcoal furnaces are now being erected.

The Metal Ware Mfg. Company, with a capital stock of $20,000, have been incorporated at Louisville, Ky., for the manufacture and sale of articles made from Sheet Iron and Tin Plate. Wm. T. Hale and J. J. Morris of Louisville and G. G. Summers of New Albany are the incorporators.

The J. R. Bryant Cresttile Conductor Company, Crawfordsville, Ind., favor us with a 46-page catalogue and price-list illustrating and describing the roofing specialties which they manufacture. The company call particular attention to their combined Cresting, Ridge Board and Electric Conductor, which is named the Cresttile Conductor. This is not only an ornamental Cresting, but is a Ridge Board as well, affording perfect protection to the comb of the house and further forming an electric conductor, as it can be attached to the valleys at the top of the house and thus, by means of the water spout and a metal ground connection, make a perfect lightning conductor. Other styles of Cresting and ornamental Ridging are shown in numerous patterns. The company also manufacture Galvanized Cornice Moldings, Ridge Rolls, Roof Gutters, Valleys, Eave Trough, Miters, Conductor Pipe and other Roofing Supplies. They are manufacturers of special styles of Roofing, such as Self Cap, Crimp and Roll Cap. They further offer to the trade Pressed Steel Brick, Steel Weather Boarding, Paneled Steel Ceilings, Weather Vanes, &c.

The Packers' Sanitary Can Company, 100 Broadway, Paterson, N. J., have been incorporated with a capital stock of $500,000, to manufacture Tin Cans. William C. Bryant, Edward J. Norton, Alonzo Brymer, Robert J. F. Pollitt and John Murphy are the incorporators.

The James H. Watson Estate, Crawfordsville, Ind., have issued an interesting 56-page illustrated catalogue, covering the specialties which they manufacture, consisting of Galvanized Conductor Pipe, Galvanized Elbows and Shoes, Conductor Hooks, Eave Trough, Roof Gutters, Crown Moldings, Galvanized Ridging, Roof Cresting, Finials, Vanes and other supplies for roofers. The illustrations of Finials and Cresting cover a great variety of designs, running into exceedingly elaborate and ornamental patterns. Attention is particularly called to a patent Galvanized Ridge Roll and Cresting combination which is made in one piece, with no rivets or solder, in 10-foot lengths, without cross seams, and in two sizes —namely, 8 and 10 inches in hight. The concern are prepared at all times to name special prices on all kinds of Metal Roofing, including Corrugated Steel, both galvanized and painted.

The Grahl-Petersen Company have been incorporated at Omaha, Neb., with a capital of $10,000, to manufacture Tin and Iron Ware and to do a roofing business and general sheet metal construction work. They will occupy a new building to be erected south of the Merriam Block, between Main and Pearl streets. The incorporators are C. B. Grahl, H. H. Grahl, Theodore N. Petersen, H. D. Petersen, John Stange and Henry L. Schoening.

J. M. Kelly succeeds to the business of Brand & Kelly, 1727-1729 Stout street, Denver, Col., and will continue to do sheet metal work and make a specialty of hot air furnace heating and ventilating. G. Brand has retired from the firm on account of ill health.

W. J. Burton & Co., manufacturers and jobbers of Tinners' and Roofers' Supplies, at Detroit, Mich., have secured two three-story buildings adjoining their present buildings. This increases their floor space two and one-half times, the addition being made necessary by their increased business.

The F. A. Wendell Heating & Plumbing Company of Newton, Mass., have established a Tin Roofing and Conductor department in conjunction with their business.

Work on the excavations for the new plant of the Rolling Mill Company of America at Connellsville, Pa., is progressing rapidly and the construction of the mill buildings will begin very shortly.

H. H. Dickey, president of the Maryland Sheet & Steel Company, Cumberland, Md., has purchased the South Cumberland plant of the American Tin Plate Company, and has organized the Maryland Rail Company, with a capital stock of $50,000, to assume control of the property and operate it for the manufacture of Steel Rails. The new company are overhauling the plant preparatory to starting operations about May 1. The officers and directors are: H. H. Dickey, president; A. F. Baumgarten, vice-president; William C. Dickey of New York City, secretary; H. E. Weber, treasurer, and Nathan A. Taylor of the N. & G. Taylor Company of Philadelphia. Messrs. Baumgarten and Weber are respectively vice-president and secretary and treasurer of the Maryland Sheet & Steel Company.

The Stark Rolling Mill Company, Canton, are having plans prepared for a new Bessemer converting plant. Originally plans were drawn for the erection of two 35-ton open hearth furnaces, but it seems probable that the Bessemer plant may take their place.

The recently incorporated Southern Metal Company, Orangeburg, S. C., manufacturers of Steel Ceilings, Galvanized Iron Cornices, &c., have their plant, 80 x 125 feet, in operation, with plenty of work on hand and bright prospects for a good season. The officers are W. S. Barton, president; D. J. Hydrick, secretary and treasturer, and J. B. Outland, manager.

The Monarch Iron & Steel Company of Pittsburgh have been incorporated under the laws of Delaware, with a capital of $100,000. The concern propose to erect a plant at Parkersburg, W. Va., adjoining that of the Parkersburg Iron & Steel Company, to make Planished Iron Sheets.

The six-mill Sheet plant of the Ashland Steel Company, Incorporated, at Ashland, Ky., will be ready to start in from three to four weeks.

The Tuscora Steel Company, Newcomerstown, Ohio, have placed two mills of their new Sheet plant in operation and were to start up the third this week. The Tuscora Steel Company were organized last spring, with a capital stock of $200,000, and shortly thereafter broke ground for the erection of a four-mill Sheet plant and galvanizing plant. The product will be Black and Galvanized Sheets. The equipment was mostly furnished by the International Power Company of Worcester, Mass.; Braddock Machine & Mfg. Company, Braddock, Pa.; Case & Co. of Columbus, Ohio; Otis Steel Company of Cleveland, and Keystone Mfg. Company of Erie, Pa.

Edward Atkinson, president of the Boston Manufacturers' Mutual Fire Insurance Company, suggests that one or two large or jumbo sprinkler heads be put near the foot of the elevator or belt shafts, in such position as to throw a heavy volume of water directly upon the chief motors and at points where grease may be scattered so as to become dangerous. The bearings of every large high speed fan should be guarded by sprinkler heads in the same way, as they are very liable to become heated. The expense of this safeguard will be very slight. The large sprinkler heads can be supplied by the General Fire Extinguisher Company, by the Walworth Mfg. Company or by the Estey Sprinkler Company.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

QUICK HEATING BOILER CONNECTIONS.

From S. L. R., Newark, N. J.—Will *The Metal Worker* kindly explain to me which is the best method of heating water in an upright boiler, so as to secure hot water quickly? I ask for this information with a view to learning whether the provision of more and differently located openings in the sides of the boiler will be an improvement. The ordinary upright boiler has but four

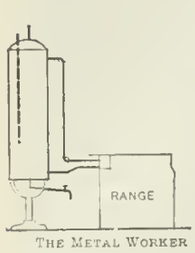

Fig. 1.—Proposed Connection.

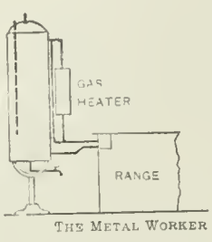

Fig. 2.—With Gas Heater.

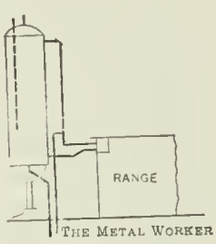

Fig. 3.—Multiple Connection.

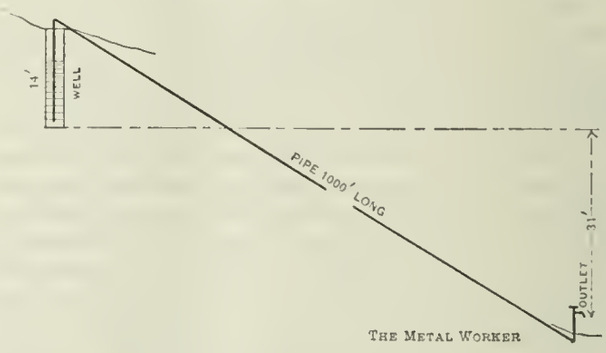
Quick Heating Boiler Connections.



holes, while I would suggest five—two on the top, as usual; one in the bottom for cleaning and emptying purposes, and two on the side for circulating purposes. I would place the lower side opening 4 inches above the bottom, so that it will be well up above the sediment, and one about 6 inches from the top of the boiler, so that the heated water can enter without having to pass through a body of cold water to lower its temperature and destroy its usefulness until all of the water in the boiler was heated. These changes would in no way reduce the storage capacity and would enable hot water to be procured much more quickly when connected by this method. It is well known that when a large quantity of water is drawn from the boiler, as on wash days, the water in the boiler will become practically cold, and some time must elapse before hot water can be procured by the old method. With the method suggested the hottest water will be that which comes back from the water back, and, as it does not have to pass through a body of cold water, a much more continuous supply of hot water will always be provided at the top of the boiler to be drawn upon. The boiler will be connected with the water back as shown in Fig. 1, so that hot water can be drawn in a short time after the fire is started. A method of connecting a gas heater is shown in Fig. 2, which does away with the clumsy connection with the hot water pipe at the top of the boiler. Two water backs, or a water back and a water heating coil in a furnace, can be connected with the boiler, as shown in Fig. 3. Are the changes in the location of the boiler openings of sufficient advantage to make it advisable to have boilers made in this way by a manufacturer?

Note.—We shall be glad if our plumbing readers will give their views on this subject. In the mean time, we would suggest that it is always difficult to get the trade to give up the use of apparatus or methods that have been so long and firmly established as the kitchen boiler and the location of its openings. It is probable that some benefit may be derived from the suggested lower connection at the side, which would enable the sediment to settle at the bottom of the boiler and not be carried through the water back in circulation. On the other hand, should steam be generated in the water back the commotion which would naturally ensue would be very likely to stir up sediment, yet not to the extent of carrying the sediment round into the water back, as would result from a similar stirring up when the pipe comes from the bottom of the boiler. It is doubtful, however, if the upper connection has very much to recommend it, inasmuch as the hot water pipe can be carried over and connected with the hot water service pipe and the same result be accomplished, even though the connection may not be considered so graceful in appearance. Numerous boilers have been constructed different in some details from those in general use, but the effort has never been attended with any considerable success. The standard form of construction is still in the largest demand in all sections of the country.

WILL THE SIPHON WORK?

From A. W. K., Lewisburg, W. Va.—I shall be glad to have the opinion of *The Metal Worker* as to whether a siphon, arranged as shown in the sketch, will operate. I want to draw water out of a well 14 feet deep through a pipe about 1000 feet long which has a gradual descent until the outlet is 31 feet lower than the bottom of the well. Will the siphon draw water successfully under such conditions? If so, where should a pump be placed to start it, and what size of pipe will be best to use?

Answer.—There should be no difficulty about a siphon drawing water under the conditions mentioned if the piping is properly arranged. It has been the experience of those who have laid such pipes that lead pipe gives the least trouble from corrosion and from allowing air to enter through it. The size of the pipe will be governed by the quantity of water desired. As small a pipe as ½-inch may be used, but there will be less likelihood of stoppage and a better flow, owing to the long length of the pipe, through a pipe of larger diameter. The difficulty in operating such a siphon is due to the liberation of air, which all water contains. If this air is liberated in the pipe it will accumulate in the crown of the siphon and stop the flow. In consequence it is well to run a pipe from the highest point in the siphon, with a stop cock near the siphon, up to some accessible point. Sometimes a funnel is connected with this pipe, and when the stop cock is open the siphon can be started by filling the long pipe through the funnel, which will allow the air to bubble up through the water and the water to run into the crown of the siphon and fill it. If this device is connected with the siphon a pump will not be necessary to start it. It will only be necessary to stop the lower end of the siphon until the long pipe is filled with water, when the flow of water through the long pipe or the long leg of the siphon will start it to work.

Will the Siphon Work?

WHAT CAUSED THE FIRE?

From D. B. M., Springfield, Mass.—Noticing the inquiry of "J. B. E." in *The Metal Worker* of March 22 I would ask, did not the furnace stand in a close room, and was not the fire due to the want of good circulation of air? Three or 4 inch holes would have been better than 2½-inch holes in the casing, and it would have been still better to have raised the furnace 4 inches above the floor without any holes. To have made it safe, one course of brick laid in cement or sand would have been safer than the iron and asbestos. I have tried both and now always use brick and cement.

From Lack of Air, Buffalo, N. Y.—In his letter in *The Metal Worker* of March 22 "J. B. E." says there

were three layers of asbestos and one of iron. The asbestos, as well as the iron, will heat hot enough to carbonize the wood floor, and just as soon as the action has gone far enough to break through the floor the natural up draft of air through the casing would start the blaze. The ashes in the stove at the time of the fire had little to do with it, as the carbonizing started as soon as the stove was put up. The safest way is to provide an air space between the floor and the iron, or two pieces of iron with a space between, or 2 inches of very fine sand between the floor and the iron. In our boat work, where we put a big range into very close quarters, we always rely on the air space. We know of one case in Buffalo where a hotel floor caught fire through three courses of brick and ¼ inch of wrought iron plate set solid on the wood.

SOFTENING A GRINDSTONE.

From W. A. K., Garnaville, Iowa.—Will some reader of *The Metal Worker* kindly tell me, through the Letter Box, the best way, if there is any, of softening a grindstone? Most, if not all, grindstones sold by local dealers are too hard.

A New Trade School.

On Wednesday evening, March 26, the new Lucas A. Steinam School of Metal Working, which has been erected as an adjunct to the Hebrew Technical Institute at 225 East Ninth street, New York City, was formally opened. The school has been built and equipped at an expense of $100,000 by Abraham Steinam and his wife in memory of their son, Lucas Steinam, who died a year or two ago. The dedicatory exercises were attended by Mayor Seth Low, Borough President Jacob A. Cantor and Jacob H. Schiff, representing the Board of Trustees of the Hebrew Technical Institute.

The new building is a six story and basement structure of brick and granite, forming a wing of the Hebrew Technical Institute. In the basement is a heating and lighting plant for both buildings. On the first floor is an assembly or lecture room, with a seating capacity of 250. The second floor is occupied by a machine shop, equipped with benches and vises for hand work, lathes, planing machines, milling machines and other tools, while the third floor contains a pattern making and wood turning shop. On the fourth floor is a joinery shop, and on the fifth floor a mechanical drawing room and two class rooms. The sixth floor contains a forge room and a molding and casting shop. The school accommodates 250 boys, who are taught the carpentry trade, forging, metal working, mechanical drawing and mathematics. The course extends over three years. At the end of the time the pupils are graduated, after successfully passing the examinations, and receive certificates of competency. The Steinam Memorial School will be under the general management and supervision of the directors of the Hebrew Technical Institute.

Aluminum.

Aluminum, says Professor Wilson in a paper recently read before the British Association, does not exist uncombined in the metallic state, being essentially a product of chemical industry. Aluminum can be used to produce an enormous number of alloys, some of which, containing 1 or 2 per cent. of other metals, combine the lightness of aluminum with greater hardness and strength. On the other end of the scale alloys containing from 90 to 99 per cent. of other metals exhibit properties of those metals, but much improved for certain purposes: Unfortunately it is when aluminum is used alone that its chief recommendation—lightness—is found to be counterbalanced by other considerations. The efforts that have been made to use aluminum wire for telegraphs and telephones have not been very encouraging, owing to the uncertain texture and weakness of the drawn wire. The same difficulty occurs with tubes and sheets of the metal. No guarantee of strength can be obtained from the manufacturers short of thickness far in excess of what would be required of copper and still harder and tougher alloys. There is consequently no advantage in using the lighter but more uncertain and costly metal. The chief advantage of commercial aluminum appears to be for the construction of cooking utensils. A great difficulty is found in soldering the metal; and it will not stand salt water. On the whole, therefore, aluminum must be classified by practical men as a disappointing metal.

City Garbage Used for Illumination.

The Borough Council of Bermondsey, one of the most thickly populated districts of London, has recently brought to completion a new electric lighting and garbage destructor plant, which is claimed to be a great success. The works are situated on the Spa Road, near the Bermondsey Town Hall, and occupy about 1½ acres. The buildings consist of a destructor house, an engine room containing the generating plant, a pump and fan room, an accumulator room and offices. The destructor house is specially designed with the view of giving adequate ventilation. It consists of six cells, each having 26 square feet grate area, and capable of destroying 50 tons of refuse in 24 hours. The refuse to be destroyed is brought in by the collecting vans, conveyed along an inclined roadway to a tipping floor at the back of the destructors, and discharged into spacious bins placed over the tops of the cells, from which the latter are fed as required through rectangular shoots. After passing through the shoots the refuse is deposited on a hearth at the back of the furnace, and is there thoroughly dried before the actual burning takes place. By these means the refuse is rendered more combustible and the vapors which are given off become innocuous by being passed over the hottest part of the furnace. The gases from the cells pass out at the front and come into contact with the boiler tubes, and are thus utilized for the purpose of raising steam. Each cell and boiler furnace is fitted with forced draft apparatus.

In deciding the system of distribution most applicable to Bermondsey, the engineers had under consideration the fact that the district is very concentrated and is filled with factories and workshops, and that the most favorable opportunity occurred for supplying electricity during the day time for motive power purposes. The alternate current system was therefore not deemed so suitable as the continuous current, which has been adopted. The plant at present installed in the generating station consists of three multipolar generators. Two sets each have an output of 150 kw. at 480 to 520 volts, and the third set an output of 75 kw. at 480 to 520 volts. The battery, which consists of 280 cells, is capable of giving a discharge of 83 amperes at 510 volts for six hours, or on an emergency 300 amperes for one hour. The switch board has been designed to control three dynamos, six feeder circuits, eight arc circuits, the Town Hall, the depot and station lighting and power circuits, the storage battery, &c. In the borough the three-wire system of mains has been adopted, and the feeder mains are at present four in number. With regard to the public lighting, there are at present 71 standards erected, supporting 10-ampere double carbon arc lamps and incandescent lamps. At 12 o'clock every night the arc lamps are permanently turned out and the incandescent lamps are lighted. The charge for electric lighting is 12 cents for the first hour and 6 cents for each hour afterward, based on the minimum demand system. For motive power purposes the charge is 5 cents per unit. The question of the disposal of the residuum from the destructor has occupied the attention of the Council, and an electrically driven hydraulic plant for the manufacture of flags from a portion of the clinker had been laid down. That machine will turn out flags at the rate of 25 per hour at a very low cost. The clinker is ground very fine, mixed with a due proportion of cement, thoroughly incorporated, and then subjected to a pressure of 1000 pounds per square inch and afterward allowed to dry.

Reports from England state that 30,000 tons of Russian foundry iron have been sold for shipment to this country and that an export bounty is paid on this iron.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is easier, with demand very quiet.

Copper continues quiet and is somewhat weaker in price.

Pig Lead is dull, but steady in price.

Spelter rules very firm, with a light volume of business.

Antimony is unchanged.

Nickel is without change in price and in good demand.

Aluminum is active at unchanged prices.

Tin Plates are quiet and firm.

Sheets are still in active demand; jobbers' prices are rather lower.

Old Metals are in good demand, with prices firm.

Foundry Iron is still scarce and prices have an upward tendency.

Sheet Copper is in good demand and firm in price.

Sheet Zinc is without change.

Hardware is moving actively and prices are firm, with upward tendency in some lines.

Plumbers' Supplies are in good demand; prices show much firmness.

Cast Iron Steam Fittings will be advanced; prices have been withdrawn by manufacturers.

Wire Nails are scarce, with demand improving and prices firm.

Cut Nails are in fair demand at unchanged prices.

Window Glass prices are expected to advance next month.

Step Ladders have been marked up 1c. per foot.

Linseed Oil is stiffening, with likelihood of advance.

Spirits Turpentine has advanced 1½c. per gallon.

Rosin prices are somewhat higher.

METAL MARKET.

NEW YORK, March 28, 1902.

Pig Tin.—Early in the present week spot Tin advanced sharply, but, as a result of freer arrivals, an equally sharp decline followed, and the market closed with an easy tone, due to absence of demand. Available supplies are light and sellers hold spot Tin steady at previous quotations. The volume of transactions, however, was very light. Jobbers' prices are unchanged, Straits Pig in small lots being quoted at 27½c. to 28c. per lb.

Copper.—The Copper market is weak and wholesale prices have gone off a fraction since last week. Very little business is being transacted, as consumers still show no disposition to enter the market, being evidently supplied with metal purchased some time ago on contract. Retail prices are unchanged. Lake Ingot in small lots is quoted at about 13¼c. to 13¾c. per lb., and Casting Copper at 13c. to 13¼c.

Sheet Copper.—A good consumptive demand continues for Sheet Copper. Buyers, however, are purchasing mainly in a hand to mouth way, and are taking only such amount of stock as they can readily use. Prices are steady on the basis of 18c. per lb. from store.

Pig Lead.—The situation in the Pig Lead market is without change. Business is dull and uninteresting. Prices are firm, American Pig in small lots being quoted at about 4.45c. to 4½c. per lb. Advices from St. Louis report the conditions in the Pig Lead market there to be quiet, with prices on a firm basis.

Spelter.—Spot Spelter is still scarce and the market is very firm, though quiet. Jobbers quote Western brands in small lots at 4.60c. to 4.70c. per lb. St. Louis advices report the market for Spelter to be fairly active, with a very substantial demand and light offerings.

Sheet Zinc.—A moderate demand for Sheet Zinc is reported. Prices are unchanged at 6¾c. per lb. for 600-lb. cask lots, and 7c. to 7¼c. for smaller quantities.

Antimony.—This metal shows no change. Hallett's is quoted at 8⅝c. to 8¾c. per lb. in small parcels; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—There are several unconfirmed rumors regarding new developments in the Nickel industry. One report has it that the Canadian Copper Company and the Orford Copper Company, who refine the Canadian product, are to become affiliated with United States Steel Corporation interests. Another rumor says that the Orford Copper Company, Canadian Copper Company and the Nickel Corporation of London are to be consolidated. It is a fact that a movement of some sort is on foot. Details are, however, not divulged. Prices are unchanged, small lots being quoted at about 55c per lb.

Aluminum.—No change has taken place in prices or in the volume of business, which continues good. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—There was no change whatever in the Tin Plate situation during the week. The only feature of interest was the announcement made by the American Tin Plate Company that orders at present prices will be accepted on purchases for delivery up to the end of the third quarter of the year. Deliveries on former contracts are being made in considerable volume, but the amount of new business is said to be rather light. Prices are steady and unchanged. American Bessemer Coke Plates, IC, 14 x 20, are selling in small lots at about $4.85 to $5 per box at New York and corresponding points.

Sheets.—The demand for both Black and Galvanized Sheets is still very active, that for Galvanized being heavier than for Black, but the market on both is very firm. Most of the mills have all the orders they can fill in the next two or three months, and it is regarded as almost certain that great difficulty will be met with in making deliveries promptly. Jobbers' prices have softened slightly on more liberal receipts from mills. No. 27 One Pass Cold Rolled Soft Steel Sheets, in small lots, delivered at New York or corresponding points, are quoted at 3.85c. to 3.90c., and Galvanized Sheets at 70 per cent. to 70 and 2½ per cent. off the list.

Chicago advices are as follows: A fair demand is noted for Black Sheets, but a heavy business is doing in Galvanized. Mills are making reasonably good delivery on Black Sheets, but orders booked are evidently satisfactory, as prices are well maintained. Sheets of heavy gauges are scarce and mills are much in arrears. Jobbers quote small lots at 3.35c. to 3.45c. for No. 27 Black, and 70 and 5 for Galvanized.

St. Louis advices are as follows: A good active market for Sheets of all grades is to be reported and prices are on a firm basis. Jobbers quote Stove Pipe size, No. 27, at 3.60c. to 3.65c., and Galvanized Sheets, 70 to 70 and 5 off in round lots.

Old Metals.—A slight letting up is noted in the urgent demand for Scrap Iron, but prices still hold firmly. Old Metals of other descriptions are moving in good volume at unchanged prices. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 11¼c.
Light and Tinned Copper	per lb. 10 c.
Heavy Brass	per lb. 8¾c.
Light Brass	per lb. 6½c.
Lead	per lb. 3¾c.
Tea Lead	per lb. 3⅝c.
Zinc	per lb. 3 c.
Pure Aluminum Sheet	per lb. 25 c.

Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 15¾c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.50 to 14.00
Heavy Cast Scrap, per gross ton	12.50 to 13.00
Stove Plate Scrap, per gross ton	9.50 to 10.00
Burnt Iron, per gross ton	7.50 to 8.00

THE PIG IRON MARKET.

NEW YORK.—The local market is quiet and very firm. For the third and fourth quarter Lehigh Valley and Schuylkill Valley furnaces are asking $18 at furnace for No. 2 Foundry, equivalent to $18.65 tidewater, while for early delivery considerably higher figures are being realized. Prices abroad are too high to allow importations at the present time. The Southern furnace interests held a meeting in this city this week and reaffirmed the price schedule for Western delivery. A movement to advance the price was given up. We quote for forward delivery, Northern Irons: No. 1, $19.50 to $19.75; No. 2 X, $18.50 to $18.75; No. 2 Plain, $18 to $18.25, at tidewater; Tennessee and Alabama brands, No. 1 Foundry, $16.75 to $17; No. 2 Foundry, $16.25 to $16.75; No. 1 Soft, $16.75 to $17; No. 2 Soft, $16.25 to $16.50; No. 3 Foundry, $15.50 to $15.75; No. 4 Foundry, $15 to $15.50.

CHICAGO.—All kinds of Spot Iron are in sharp demand at fancy prices, and a fair business has been done in Foundry Iron for delivery in the latter half of the year. The local furnace companies have advanced prices another 50 cents, but the Southern companies have not advanced their schedule, although most of them will take no more orders. Some are getting $1.50 per ton above their schedule. An important step was taken last week by the Southern companies in changing their ton from 2268 pounds to 2240 pounds. We quote as follows:

Lake Superior Charcoal	$21.00 to $22.00
Local Coke Foundry, No. 1	19.00 to 19.50
Local Coke Foundry, No. 2	18.50 to 19.00
Local Coke Foundry, No. 3	18.00 to 18.50
Local Scotch, No. 1	19.00 to 19.50
Ohio Strong Softeners, No. 1	20.10 to 20.35
Southern Silvery, according to Silicon	16.90 to 18.65
Southern Coke, No. 1	16.40 to 18.15
Southern Coke, No. 2	15.65 to 17.15
Southern Coke, No. 3	15.15 to 16.65
Southern Coke, No. 1 Soft	16.40 to 18.15
Southern Coke, No. 2 Soft	15.65 to 17.15

PHILADELPHIA.—The situation has not improved, from the buyers' standpoint, and prompt Iron is harder to get than it has been at any time during the year. Prices are gradually being worked up to a higher level, and it is impossible to give exact figures, as every seller makes his own price, but $19 would be an inside rate for No. 2 X Foundry, with some sales at $19.50 to $20—the latter figures for April and May, and the former for June and July. For the last half of the year, probably $18 to $18.50 would be considered a fair quotation. Several leading concerns have stopped quoting for the present, being sold close up to midsummer, and with a fair sprinkling of orders on their books for the later months. It is believed that prices will be no higher, but any forecast as to the future would be but mere guesswork. At the present time the following figures represent the market as nearly as possible for deliveries in this and nearby districts:

	Deliveries to July.	Deliveries July to December.
No. 1 X Foundry	$20.00 to $21.00	$19.00 to $20.00
No. 2 X Foundry	19.25 to 20.00	17.50 to 18.00
No. 2 Plain	18.75 to 19.00	17.00 to 17.50

PITTSBURGH.—The Pig Iron market continues very firm. Furnaces are now getting almost a full supply of Coke, and the output of Pig Iron in March will be much heavier than in February. There is an active demand for Foundry Iron, the foundries being full of work and using more metal than ever before. Prompt Foundry Iron is very scarce and brings premiums over prices on contracts for extended delivery. The market is somewhat difficult to quote, but No. 2 Foundry may be said to rule at $18.50 to $18.75 on contracts for extended delivery, with prompt Iron at $19.50 to $20, delivered.

ST. LOUIS.—The Pig Iron market maintains a firm tendency, but the volume of demand has slackened considerably and except in the matter of inquiry for material for the second half of the year orders are on a light scale. Any spot Iron that may be on the market is snapped up and at advances from quotable prices. Shipments are coming forward slowly, and much complaint is heard on this score. We quote for cash, f.o.b. St. Louis, as follows:

Southern, No. 1 Foundry	$16.00 to $16.50
Southern, No. 2 Foundry	15.25 to 15.75
Southern, No. 3 Foundry	14.75 to 15.25
Southern, No. 4 Foundry	14.25 to 14.75
No. 1 Soft	15.75 to 16.25
No. 2 Soft	15.25 to 15.75

CHICAGO REPORT.

Scrap Iron and Steel.—The supply is increasing and the advancing tendency has been checked. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	13.00 to 13.50
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 8.50
Sheet Iron and Hoops	8.00 to 8.50
Plow Steel	11.50 to 12.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	7.00 to 7.50
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—Consumers are freely buying stock. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11½c.
Copper Bottoms	10½c.
Copper Clips	11 c.
Red Brass	11½c.
Yellow Brass	8 c.
Red Brass Borings	9 c.
Yellow Brass Borings	7¼c.
Light Brass	7 c.
Pipe Lead	3.87½c.
Tea Lead	3.35c.
Zinc	3.10c.
Tin Foil	19 c.
Pewter, No. 1	16 c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—Trade is dull and prices are not strong. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6¾c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6½c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—The trade is still looking for a decline. Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 70c. to 75c. per 100 lbs. in any quantity.

Anthracite Coal.—Business will be quiet until the new spring schedule is announced. Prices are as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE HARDWARE TRADE.

The coming of decided spring weather has had the effect of stimulating business, as merchants are entering upon more active and definite preparations for the season's business. Reports from travelers are almost uniformly of a cheerful tenor, and their order sheets cover a variety of goods in entirely satisfactory quantities. Prices are firm, with something more of an upward tendency than is regarded as entirely healthful by many in the trade. On account of the condition of the Iron market advances in some of the finished products, especially those into which Iron enters largely, have been found necessary, and the announcement of higher prices in such goods is a feature of the situation. Many of the manufacturers are unable to turn out goods as promptly as their customers desire, a fact which not only reflects the large volume of business, but is explained as caused by the difficulty of obtaining raw material, the factories being thus prevented from running to their full capacity. The amount of current business which is coming in to the manufacturers is undoubtedly diminished somewhat by the fact that the larger buyers have already covered

their wants, and are not yet under the necessity of replenishing stock. Backwardness of the season in many parts of the country has also operated somewhat to repress trade. Notwithstanding these influences jobbers report an excellent demand and there is little reason for complaint. The business of the country is evidently going at the great pace which has kept up for some time, and the indications point to a very large and prosperous season's business.

NOTES ON PRICES.

Porcelain Enameled Bathtubs.—The Standard Sanitary Mfg. Company of Pittsburgh are about to issue new list prices on all Porcelain Enameled Bathtubs. It is understood that the new list prices will be considerably reduced from the prices which have heretofore prevailed, but there will be no reduction in the net selling prices of these goods. The Standard Sanitary Mfg. Company have always used the high lists, thereby giving the retail trade a better opportunity to reap greater profits than they would get on the Tubs made by other manufacturers and which are listed at lower prices. It is said that the new prices will be so arranged that the jobbing trade, through which the products of this concern are marketed, will be able to give a much smaller discount than formerly. The new lists will probably be issued prior to April 10, but will be in effect on and after April 1.

Galvanized Range Boilers.—The meeting of the Galvanized Range Boiler manufacturers, which took place on the 25th inst., resulted in a postponement to the early part of April, subject to the call of a committee which has several important matters in hand. It is said that matters are being satisfactorily arranged and that in a short time the members of the association will have absolute control of the marketing of this class of goods.

Cast Iron Steam Fittings.—The manufacturers of Cast Iron Steam Fittings withdrew all quotations on March 26. The withdrawal of prices was unanimous on the part of all the manufacturers. New and higher prices will be quoted only upon application. The manufacturers have discontinued the sending of indiscriminate and unsolicited quotations.

Wire Nails.—The difficulty of getting prompt shipments on Wire Nails from mills continues. The manufacturers were behind with their orders before the recent floods, and the two weeks which were lost as a consequence of this interruption have been very much felt. From present indications there seems to be little hope of improvement in the situation for the next 30 days at least. With better weather the local demand for Wire Nails in the New York market shows improvement. Most of the jobbers' stocks are broken in assortment, owing to delayed shipments. The market is firm at $2.25 to $2.30 per keg for small lots of Wire Nails from store.

Cut Nails.—There is a fair demand for Cut Nails, with some difficulty in getting prompt shipments. Small lots from store, New York, are quoted at $2.25 per keg.

Window Glass.—It is quite generally believed that when the Jobbers' Association place another bulk order for Glass with the combined manufacturers the prices will be higher than when they made their last purchase. Reports are current to the effect that the Jobbers' Association will make another advance in prices during April. Meanwhile the association quote a discount of 95 and 50 per cent. from store.

Step Ladders.—An advance of 1 cent per foot has been made by manufacturers in the price of Step Ladders.

Linseed Oil.—The tone of the market for Linseed Oil is hardening and there is talk of a further advance at an early date. The demand for Oil is improving, City Raw in small lots being quoted at about 64 to 64½ cents per gallon, and out of town Raw at 63 to 63½ cents.

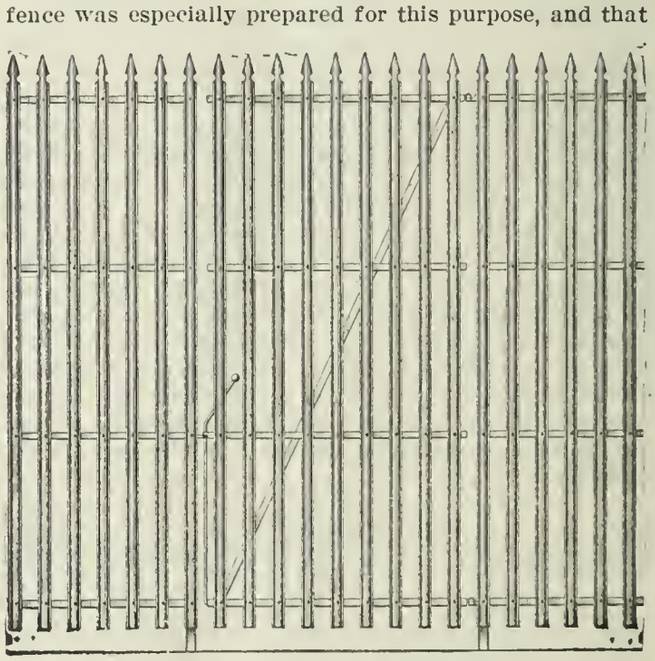
Spirits Turpentine.—The volume of buying is limited, consumers taking only such amount as will fill present requirements. Prices, however, have stiffened again, on the strength of short supplies at Southern points. Small lots of Turpentine are now quoted at 50½ to 51 cents per gallon.

TRADE NOTES.

The Chicago Furnace Supply Company of Chicago have been incorporated by F. W. Metz, A. E. Williams and D. A. Colbert with $15,000 capital to manufacture articles from iron, tin and sheet metal.

The Lennox Chemical Company, manufacturers of the Lennox Soldering Fluid, &c., are making substantial additions to their present plant on Willson avenue, Cleveland, Ohio.

The machinery has been installed in the new plant of the New Castle Stamping Company, at New Castle, Pa., and the factory is expected to be put in operation April 1.



The report that the Pittsburgh Reduction Company of Pittsburgh, manufacturers of Aluminum, are planning to build a plant in East St. Louis, Mo., for the manufacture of Aluminum Wire, is untrue. This concern have no such plans under way at this time.

The Arkansas Slate Company of Mount Ida, Ark., have been incorporated with a capital stock of $250,000. Curtis Wright is president of the concern; W. R. Logan, vice-president, and William J. Wright, Jr., secretary and treasurer.

Frantz Hardware Company, Enid, O. T., wholesale and retail Hardware, Stove, Buggy and Wagon and Agricultural Implement merchants, expect soon to occupy their new establishment, and express a desire for catalogues of up to date Hardware Store Fixtures. They will also value catalogues, circulars, &c., pertaining to the general Hardware line.

The World's Fair Fence.

The fence shown herewith, manufactured by Mesker & Brother, St. Louis, Mo., will be used to inclose the park side of the Louisiana Purchase Exposition Grounds. The manufacturers state that this style and design of fence was especially prepared for this purpose, and that

The World's Fair Fence.

it was selected for its cheapness, durability and neat appearance. It is made entirely of steel pressed into its molded form, consisting of end, line and gate posts, rails, pickets and gates. The fence is now made in various hights suitable for residences, public parks and cemeteries.

In order to handle their rapidly growing galvanizing and tinning business the Malleable Iron Fittings Company, Branford, Conn., are obliged to again increase their capacity in this department, and have under consideration plans that call for a new building to contain

about 7000 square feet of floor space. The new plant will have its own power plant and shipping room, the power being required in the gray iron tinning department, and the building will be equipped throughout with overhead and surface tracks to facilitate the rapid and economical handling of work. In addition to their regular line of Galvanized and Black Malleable Iron, Steam, Water and Gas Fittings, which include everything in these goods known to the trade, they contract to manufacture for others hardware specialties of malleable iron, galvanized or tinned, and are manufacturers of Malleable, Steel and Semisteel Castings. Their plant being located at tidewater places them in exceptionally good position to manufacture goods at the minimum of cost.

Some Old Cement Recipes.

That old recipes must not be despised is evidenced on every hand, says the *Decorators' Gazette and Plumbers' Review* of London. Manufacturers frequently bemoan their inability to match an old varnish, color, cement or Roman mortar. We take the following recipes for glues and cements from a book published in 1755, and give them just as they stand:

A water cement, which the longer it is in water the harder it grows.—Take mastick, incense, rosin and fine cut cotton, of each an equal quantity, melt, and with some powdered quicklime mix them up into a mass.

A cement as hard as iron.—Melt pitch, then take ground sand, worn off from grind stones, stir them well together, boil it up and it is fit for use.

An excellent glue for wood, stone, glass and metals.—Take good glue, 4 ounces, soak it over night in distilled vinegar, then boil it up therewith; take a clove of garlick, beat or bray it in a mortar, add to it 1 ounce of ox gall. Wring this juice through a linen cloth into the warm glue; then take mastic and sarcacolla, of each 1 dram, sandarac and turpentine of each 2 drams; grind the sandarac aud mastic fine, and put them together with the sarcocolla aud turpentine into a vial; pour 1 ounce of the strongest brandy upon it, and let it stand three hours in a moderate heat, well stopped up, giving it now and then a shake; add this also to the warm glue; then stir or beat it together with a wooden spatula, till some of the moisture is evaporated and the glue is grown cold. When you have occasion to use it, then take as much or as little as your work requires, soak it iu strong vinegar till it is dissolved. If you use this glue for stones mix it with tripoli, or with some powdered chalk; and if for glass mix besides a little tripoli, fine ground Venice glass; aud if you would use it for metals, as iron, brass, copper, put to it some of the finest filings. You may also add a little isinglass. And if you would have this glue hold out or staud the water, mix it up with a strong varuish as much as the present occasion requires.

A good stone glue or cement for grotto work.—Take 2 parts of white rosin, melt it clear, add to it 4 parts of beeswax; when melted together, add stone flower, of the stone you design to cement, 2 or 3 parts, or so much as will give the cement the color of the stone; to this add 1 part of flower of sulphur; first incorporate all together over a gentle fire and afterward knead it with your hands in warm water. With this cement the stones after they are well dried and have been warmed before the fire, in order to receive the cement the better.

A wood glue which stands water.—Common glue mixed up with linseed oil or varnish, applied to the places to be glued together, after they have been warmed, and when thoroughly dry will last and stand water.

Another fine glue.—Take the isinglass and common glue, soak them over night in strong brandy; then dissolve them over a coal fire and mix with a little fine powdered chalk. This will make a very strong glue.

Another extraordinary glue.—Take sal ammoniac, sandarac aud gum lacca, soak and dissolve them in strong brandy, over a gentle heat, put to them a little turpentine; when all is dissolved, then pour the solution over isinglass and common glue, and in a close vessel dissolve it over a slow fire; add to it a little glass dust, and when it is of a right temper use it.

A good water cement.—Take 1 part of minium or red lead and 2 parts of lime; mix them well together with the whites of eggs.

Stone glue, wherewith you may glue either stone or glass.—Take white flintstone powder which is dry and finely searced; then take white rosin, melt it in an iron or earthen ladle, stir the powder in it till it is like a thick paste: warm the glass, or what you design to glue together, gild the places or joinings and it will add a great beauty. This has been made use of in the embellishment of cabinets and other things.

Improvement in the car service at the coke ovens and iron furnaces has been marked in the past week or ten days, owing to the more favorable weather conditions. It is to be expected that from now on affairs will rapidly assume better shape, as regards fuel supply and shipping facilities in the iron and steel industry, and the scarcity and congestion that have marked the past few weeks will gradually disappear.

PERFORATED METALS

STEEL, IRON, COPPER, ZINC, BRASS, TIN, and all other metals PERFORATED AS REQUIRED for

Grain Cleaning and Mining Machinery, Woolen, Cotton, Paper and Pulp Mills, Rice, Flour and Cotton Seed Oil Mills, Sugar and Malt Houses, Distilleries, Filter Presses, Stone, Coal and Ore Screens, Brick and Tile Works, Filters, Spark Arresters, Gas and Water Works, Oil, Gas and Vapor Stoves, Coffee Machinery, &c., &c.

Standard Sizes Perforated Tin and Brass Always in Stock.

The Harrington & King Perforating Co.,

Eastern Office, 284 Pearl St., NEW YORK. 217 North Union St., CHICAGO, ILLS., U.S.A.

CLASSIFIED LIST OF ADVERTISERS.

Acetylene Gas Burners.
Carroll, J. B., Chicago, Ill.

Acetylene Gas Generators.
International Heater Co., Utica, N. Y.

Aluminum Coated Sheet Steel.
Steel & Iron Aluminum Coating Co., Connellsville, Pa.

Aluminum Ingots.
Janney, Steinmetz & Co., Phila., Pa.

Aluminum Scrap Buyers.
Janney, Steinmetz & Co., Phila., Pa.

Aluminum Sheets.

TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION

A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop.

An elementary manual for the young tinsmiths A handy reference for all sheet metal workers.

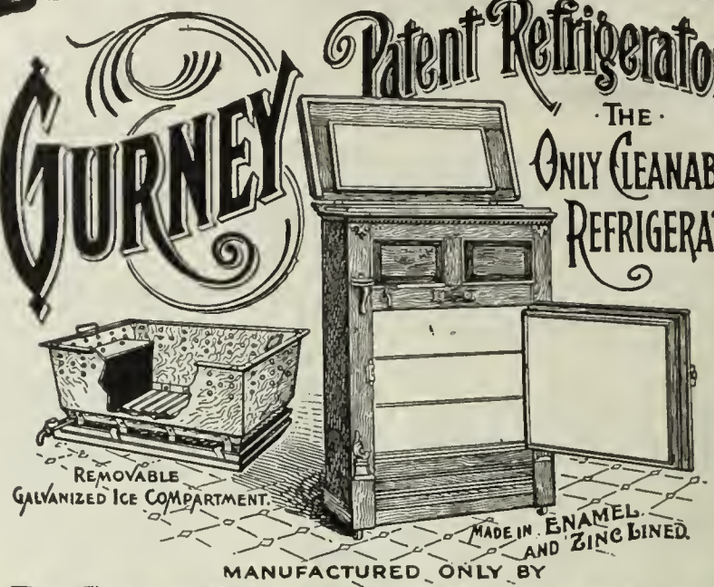
120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 ⁘ Pages 1-66
Diagrams and Patterns

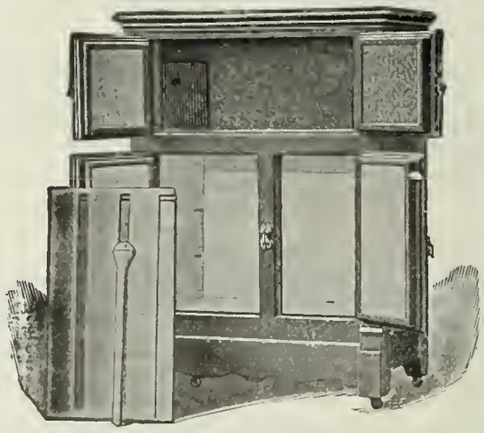
Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ⁘ Pages 69-88
Epitome of Mensuration



Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ⁘ Pages 89-120
Tables, Rules, Recipes



Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

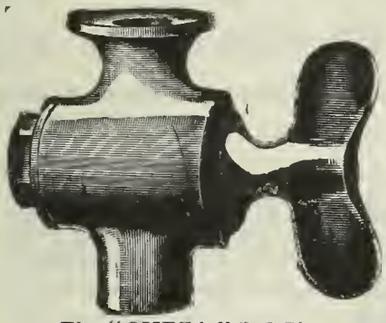
The White Mountain Freezer

Has gained first place among freezer buyers and is in great demand. . .

"Has gained first place among freezer buyers." Think what it means to be the favorite freezer with seventy million people! Think of the good words half of these people can say! Think how much easier it is to sell something every one praises.

There is probably no article sold to-day for household use that gets more free advertising than the White Mountain Freezer, and the dealer should not forget that every time he sells a White Mountain Freezer he makes an ally that tells his story free—tells it to those who will buy—and when they buy he gets the benefit.



Every leading jobber handles the White Mountain Freezer, and will quote you prices by return mail.

WRITE YOUR JOBBER TO-DAY.

A Few Points About
The Dover Elbow:

No unsightly seams or corrugations standing out to give it a bunched appearance.
The outside can be polished, as it presents a smooth, even appearance.
The seams are folded on the inside.
No corrugations to reduce diameter and collect soot.
No seams to corrode and rust.
It is made on a scientific principle. It is the same diameter as the pipe.
It is handsome. It is strong. It is the best elbow on the market.

This—(MF)—is the trade-mark stamped on every sheet of M F Roofing Tin—the best roofing tin made—fifty years the world's standard for roofing tin. This mark is evidence that the tin bearing it has the heaviest and richest coating of pure tin and new lead, dipped by the palm-oil process, and manufactured entirely by hand *labor, M F is impervious to rust—it is the roofing that will last a lifetime, and costs but little more than a roof that burns—or melts—or freezes—or breaks. If you are going to rebuild, specify M F ROOFING*

METAL CEILINGS AND A STORY

Once, so the story goes, a dealer was buying a horse. After having been shown some with past records and some with possible future records, the young man said: "I don't want a Has-Been, nor a Will-Be—I want an Is'er."

The same may be applied to Metal Ceilings. If you wish to be an "Is'er," or a leader and winner, depends upon what Metal Ceilings you handle.

The "Has-Been" ones will lose you trade and prestige where the right ones would help you win them. The right ones are

BERGER'S "Classik" CEILINGS

BERGER'S Classik METAL CEILINGS

The dealer who handles them has substantial inducements to offer his trade.

1. Greater variety of patterns to choose from.
2. Handsomer and more artistic designs.
3. Deeper stamping.
4. Complete Classified Designs, in harmony throughout.
5. Valuable constructional features, reducing number of joints and facilitating handling and erections.

More than that, they actually win business from those who formerly could not be induced to give Metal Ceilings consideration.

The line that will do that is the one it will pay you to handle.

Write us to-day about it.

FIRE PROOF. LOW PRICE, DURABLE.

BLACK ASPHALT ROOF PAINT

It is used extensively in every State in the Union. It withstands extreme heat or severe cold, and has a tenacity and elasticity peculiarly its own. It is ready for use, easily applied, protects and preserves any exposed surface.

For Tin and Iron Roofs, also Bridges, Gas Tanks and Underground Pipes

This Paint has never been equaled. **TIN ROOFS,** even when rusted, broken and leaking, can be rendered water-tight and serviceable ; our Asphalt Roof Paint and Cement fills up holes, breaks, joints, and by its elastic and tenacious qualities keeps the roof tight.

STOWELL MFG. CO., - - Jersey City, N. J

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

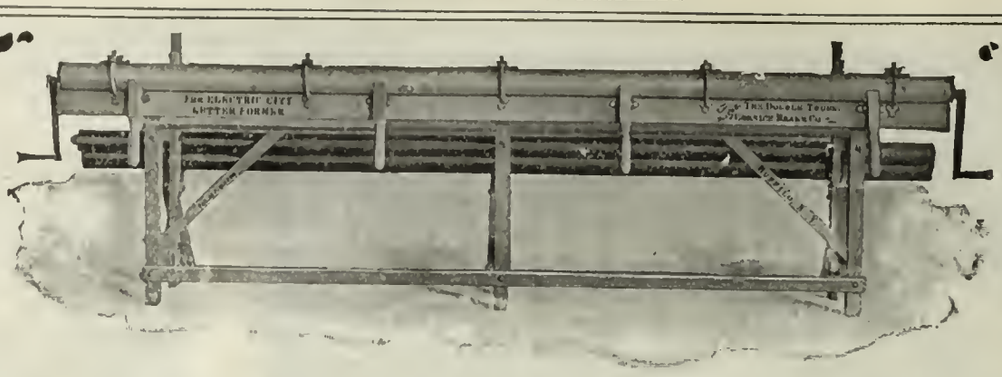
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials —13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections) —325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

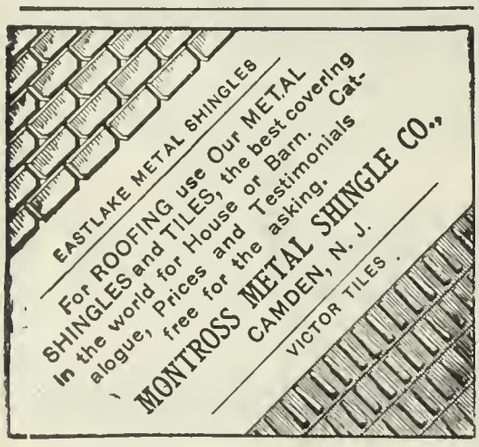
THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.



The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.

With Lever Arc, Automatic Gauge. Will cut No. 2 iron.

97 inches long

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel 1/8 inch thick, cut off and mitre angle iron 1/8 inch thick, and do it perfectly.

WRITE FOR LOWER PRICES.

Mrs. Griffin (at work drawing the bird): "There's about everything else in this one, and I didn't know but I might come across some money before I finished."—*Boston Transcript.*

Contentment is a Jewel.

And when found in the kitchen it is priceless. The Housewife is always contented with her ***BAY STATE RANGE*** because ***it Bakes, Broils and Roasts*** to perfection.

MORAL:—Handle Bay State Ranges and keep peace in the family.

CHARLES MILLAR & SON CO., Utica, N. Y.

HUB RANGES

HUB

If you want the best line; the line with the **most attractive** and progressive selling features, look into the merits of the

Hub
Line of Ranges.
Steam and Water Heaters;
Hot Air and Combination Furnaces.

SMITH & ANTHONY CO., Boston.

Every Roofer has a certain kind of tin for his standard of the highest quality. If you do not know the Taylor Old Style brand, your standard is set too low.

N. & G. TAYLOR CO.
Sole Manufacturers
PHILADELPHIA

A Cheap Priced

stove is usually shoddy. Shoddy means half fitted. You fit the other half which makes the shoddy cost more than first class goods. There's no use in talking if you believe in quality—sell

GLENWOODS.

Write the Weir Stove Company, Taunton, Mass.
